 12 o'clock, M., of said day, to pay said delinquent as-
 sessment thereon, together with costs of advertising and
 expenses of sale.

A. O. WOOD, Secretary.
 Office, 338 Montgomery street, San Francisco. oc20

Lady Bell Copper Mining Company, Low Di-
vide Mining District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of
 Trustees of said Company, held on the eighteenth day of
 October, 1886, an assessment of ten (10) cents per share
 was levied upon the capital stock of said Company, payable
 immediately, in United States gold and silver coin, to the
 Secretary, or to J. K. Johnson, at Crescent City.

Any stock upon which said assessment shall remain un-
 paid on the nineteenth day of November, 1886, shall be
 deemed delinquent, and will be duly advertised for sale
 at public auction, and unless payment shall be made be-
 fore, will be sold on Thursday, the sixth day of December,
 1886, to pay the delinquent assessment, together with costs
 of advertising and expenses of sale. By order of the Board
 of Trustees.

C. HEYWOOD, Secretary.
 Office, 311 Market street, San Francisco, Cal. oc20

Ophir Silver Mining Company.—Location of
 Works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of
 Trustees of said Company, held on the sixteenth day of Oc-
 tober, 1886, an assessment of six dollars (\$6) per share was
 levied upon the capital stock of said Company, payable
 October nineteenth, in United States gold coin, to the Sec-
 retary, at the Company's office, No. 402 Montgomery street,
 San Francisco, California.

Any stock upon which said assessment shall remain un-
 paid on the nineteenth day of November, 1886, shall be de-
 deemed delinquent, and will be duly advertised for sale at public
 auction, and unless payment shall be made before, will be
 sold on the tenth day of December, 1886, to pay the
 delinquent assessment, together with costs of advertising
 and expenses of sale. By order of the Board of Trustees.

THOS. J. LAMB, Secretary.
 Office, 402 Montgomery street. oc20

Office of the Ophir of the Colorado Silver Min-
ing Company.—October 13th, 1886.

ANNUAL MEETING.—The Annual Meeting of the Ophir of the
 Colorado Silver Mining Company, will be held at the office of
 the Secretary, No. 628 Clay street, San Francisco, at 4
 o'clock P. M., MONDAY, the 19th day of November, 1886, for
 the election of officers and the transaction of business.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Lega; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. This it is constantly passing in a regular flow between the grinding surfaces and to the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has won unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's liches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to
KNAPP & GRANT,
San Francisco.

Leffel's Lever Jacks,
For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by
KNAPP & GRANT,
San Francisco.

PAGE'S PATENT FOR RAISING SUNKEN VESSELS!

SHIPPING AND INSURANCE COMPANIES, AND other parties upon this Coast or in the Atlantic States, having occasion to avail themselves of this machinery, which has been tried and proved a success, will please address, for the present, JOSEPH DEY, San Francisco or at the office of the Mining and Scientific Press.
AUSTIN Z. PAGE, Patentee.

To Ditchmen, Millmen and Others Requiring
IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground.
1912

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,
416 Market street, San Francisco.

V. CUSHING, Agent

—FOR THE—

Purchase & Shipping of Machinery
OF ALL KINDS.

Special attention given to Quartz Mill Machinery and Findings, and Miners' Material of every description.

Being a PRACTICAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at the LOWEST PRICE in the city.

Refer, by permission, to—
Governor F. F. Low;
T. Menden, Stockton;
Jacob Underhill & Co., San Francisco;
J. W. Stowe, Russell & Erwin Manufacturing Company;
Office, No. 120 Front street, San Francisco.

BLAKE'S QUARTZ BREAKER! PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
3v13f SAN FRANCISCO.

STODDARD'S CELEBRATED WATER FILTERS!

RENDER RAIN, RIVER, OR SPRING VALLEY WATER R perfectly pure and healthy. Three sizes. Price, \$14, \$15 and \$18. For sale by

S. B. STODDARD,
Corner of Battery and Pacific streets.
June 23, 1866. 2v12-3m

Rubber Belting, WITH COTTON FILLING.

A FULL ASSORTMENT OF 3 AND 4-PLY, NOW IN store and for sale by

THOMAS H. SELBY & CO.,
Nos. 116 and 118 California street

HYDRAULIC HOSE MANUFACTORY.

THREE SEAMS SEWED WITH TWENTY-PLY TWINE, and guaranteed to stand the pressure of 100 to 200 feet fall. Due to three-ply hose made. All orders punctually attended to.

S. HOWARD,
211-1y 326 Davis street, San Francisco.

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent.

At Job M. SEAMAN & Co's, 621 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other road clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is daily appreciated. The Clock has two dials, the first being the same as an ordinary clock; the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the Mining and Scientific Press.

REMINGTON'S ARMORY.

Agency, 310 Washington st., San Francisco.

PRICES REDUCED!

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Belt and Pocket, Double and Single Action; Repeaters, and vest-pocket Pistols, with copper ammunition; Police Revolvers, a new model, navy size ball, 4 1/2 to 6 inch barrel; Rifle Guns—an entirely new Arm—having a range and accuracy equal to a rifle, and a most perfect Game. All the new models for sale very low.

STODDARD'S IRON WORKS, 114 Beale Street, San Francisco.

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for this branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.
M. PRAG,
8v13-1y Stove Store, No. 125 Clay street, below Davis.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

CHANGING THE ADDRESS.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the Mining and Scientific Press from Mr. at P. O. County, State, to Mr. at P. O. County, State, 186-." 1am1s

Brevities.

OPALS in considerable quantity have been discovered in Honduras.

THE tenth victim of the Julia explosion died on the 15th instant.

DR. STEVENSON, who had commenced work in the Georgia diamond mines in 1861, just before the breaking out of the war, is to resume operations at once.

THE whale fishery is as flourishing as ever, in spite of petroleum. Prices are higher. Spermin oil is worth four dollars per gallon. Every vessel in New Bedford that can be had is pressed into the service.

THE old fashioned type is now all the rage. In England matrices from punches originally cut by William Caslon in 1726, are taken down for daily use, after having been laid aside since 1772 as obsolete, nearly fifty years after their first invention.

TWO wagons, each loaded with 5,000 pounds of powder, blew up a few days ago near Salt Lake. One joint of one of the driver's fingers, and a piece of his skull were picked up a quarter of a mile distant, being the only remains of his body that could be found.

AN attempt is to be made to introduce California oysters and quail into the Hawaiian Islands. The Vanderbilt, which sailed the other day with Queen Emma as passenger, took specimens. Attempts have been before made to introduce shellfish, but they have failed.

A NEW musical instrument has been introduced in Paris. It resembles a piano with upright strings, except that the latter are replaced by tuning forks, which, to strengthen the sound, are arranged between two small tubes, one above and the other below them. The tuning forks are sounded by hammers, and are brought to silence at the proper time by means of dampers. The sounds thus produced resemble those of the harmonium, and are extremely pure and penetrating.

A PENNSYLVANIA paper says: A monster locomotive has been added to the rolling stock of the Lehigh and Mahoney Branch of the Lehigh Valley Railroad. It is called the "Consolidation." It weighs 38 tons 6 cwt., 20-inch cylinder, with 24-inch stroke, has 8 driving-wheels, 48 inches in diameter, with but a single truck; length of furnace 8 feet; and has 173 inch flues. A few days since the Consolidation was put to a test, drawing 107 empty coal cars up a grade of 90 feet to the mile. Another trial was made afterwards when 75 empty cars were drawn up a 146 feet grade.

THE projected tunnel under the English Channel, from Dover to Calais, will involve some twenty-five miles of underground work—twenty of it under the sea. M. Gamond, the proposer of this enterprise, has made six surveys of as many different routes, with geological charts and detailed drawings. He proposes to raise a tower 284 feet high in the middle of the sea, with a shaft 650 feet in diameter, and surrounded by an artificial island. This would still leave some twelve or thirteen miles to be supplied with fresh air on each side of it. Twenty-nine feet three inches is the proposed radius of this arc, with a height of twenty-two feet nine inches, with drainage underneath, a foot-path for pedestrians, and two lines of railway. He would hope to complete this in six years, island and all—this last alone requiring some 5,000,000 cubic metres of earth to be deposited midway of the channel.

PACIFIC RAILROAD AND MINERAL LANDS.—The Nevada Gazette of Oct. 12th, says: "We notice by the Marysville Appeal, of Wednesday, that ex-parte affidavits were filed in the Marysville Land Office, on the 9th instant, alleging that certain lands situated in township 10 north, range 9 east, Mount Diablo meridian, were more valuable for mining than for agricultural purposes. Immediately upon the filing of the affidavits, the lands were temporarily withdrawn from sale, and settlers on the same and others interested are notified of their right to the counter affidavits. The township referred to is in El Dorado county, of course has been surveyed, and is included in the limits of the railroad grant. This is the only course the miners can take, under the present rules of the Land Office, to prevent their claims being swallowed up by the railroad company, and similar action will have to be taken by the people of Nevada county as fast as the land is sectionized. It appears, too, that proof has to be made for every forty acre lot, the smallest subdivision made by the Government surveyors. The proof has to be made that the land is more valuable for mineral than for agricultural purposes, otherwise it is reckoned as agricultural and given to the railroad. We think there will be little difficulty in establishing the mineral character of nearly all the land in this county lying east of Rough and Ready, and although it will entail upon the people some trouble and expense, by concerted action and the production of a sufficient number of affidavits, the whole can be saved for the benefit of the miners."

METEORIC.—A remarkable meteoric display was recently witnessed by a lady in Lynn, Mass., sister of a gentleman of this city. A fragment fell upon the grass directly in front of her window. The lady and her servant rushed to the spot and found a white substance quite hot, and smelling of sulphur. Dr. Jackson, of Boston, has pronounced it a very fine specimen of an aerolite.

In connection with the above, we clip from the Reese River Reveille of October 8th, the following account of the supposed falling of a meteor in that vicinity:

We learn from Mr. Alonzo Monroe, that while he and party were in the Reveille district, which lies about 130 miles southeast of Austin, on the 28th of September, a singular phenomena occurred. It was, perhaps, nine o'clock at night, and the men were lying asleep on the ground, when Monroe was awakened by some cause, and looking around was astonished at seeing the surrounding country lighted up as if by an extensive fire. On the instant the light became brilliant and intense, and an immense body, glowing with incandescent heat, moved rapidly through the atmosphere in a southerly direction. Monroe describes it as the grandest spectacle he ever witnessed. As the meteor disappeared, the light gradually paled, and soon faded altogether, leaving only the starlight. In from ten to twenty seconds after the disappearance of the body, the now thoroughly awakened party heard a quick succession of thundering sounds from the southward, resembling vast masses of hurtling rocks, which reverberated through the mountains for several seconds. It was, undoubtedly, an enormous meteor, which had fallen at no great distance from the camp of the party. Mr. Monroe represents the vast body as without any particular shape, and as "large as a church." Even now, in his cooler moments, he insists that it was as "large as a small house."

To Keep Ice.—Bell's Messenger says: Make a double pocket of any kind of strong woolen cloth, no matter how coarse and faded it is. Have a space of two inches or so between the inner and outer pockets, and pack this space as full as possible with feathers. You have no need to use goose feathers; hen's feathers are just as good. With a pocket thus constructed and kept closely tied at the mouth, a few pounds of ice may be kept a week.

Auction House.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 413 Montgomery street—a very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

STOCK CERTIFICATES,
STOCK TRANSFER JOURNALS,
STOCK LEDGERS,

CAUTION!

NOTICE.—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1864, and issued June 25th, 1865, to Professor HENRY WURTZ, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY,
OF NEW YORK,

Assesses of letters patent granted to Prof. HENRY WURTZ, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.

The terms and conditions upon which rights to use the process are obtainable, can be had on application to
WM. SLOSSON,
Agent of the Company, Union Iron Works, corner of First and Mission street, San Francisco.

8v10

THIS CUT REPRESENTS AN AMALGAMATOR and Separator that has stood the test of many years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are latched to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

ISRAEL W. KNOX, or
W. A. PALMER, Inventors,
No. 11 First street, San Francisco.

ANNUAL REPORT

—OF THE—

Pacific Insurance Company.

IN COMPLIANCE WITH THE ACT OF THE LEGISLATURE of the State of California, entitled "An Act concerning Corporations," passed April 22, 1850, the Pacific Insurance Company of San Francisco makes the following Annual Report:

I.—The amount of the Capital Stock of this Company is SEVEN HUNDRED AND FIFTY THOUSAND DOLLARS, and paid in COLD... \$750,000
II.—The amount of the Assets is ONE MILLION AND FIFTY ONE THOUSAND, FOUR HUNDRED AND TWENTY DOLLARS AND THIRTY-SEVEN CENTS. \$1,051,420.37
III.—The Company has NO DEBTS

IV.—The amount of Insurance effected during the year, and which remained in force December 31, 1865:
Fire... \$12,975,949
Marine... 451,405
This Company commenced underwriting Marine risks, August 1, 1865.

V.—This Company insures against the following risks, viz.: BUILDINGS, HOUSEHOLD FURNITURE, MERCHANDISE, RENTS, LEASEHOLDS, VESSELS IN PORT AND THEIR CARGOES, and other PERSONAL PROPERTY, AGAINST LOSS OR DAMAGE BY FIRE. Also, on CARGOES, TREASURE, COMMISSIONS, PROFITS, and WAR RISKS, and ON ALL MARINE AND LAND NAVIGATION RISKS, TO AND FROM ALL PORTS IN THE WORLD.

VI.—This Company will take on any FIRST-CLASS RISK not to exceed \$75,000 (the limit fixed by law), and on all large risks will reinsure to an extent consistent with PRUDENCE in other RESPONSIBLE COMPANIES.

J. HUNT, President.

A. J. RALSTON, Secretary.

Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.
These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with an without carriages.

Also, Portable Saw and Grist Mills.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

SLOP HOPPER.—John Marquis, of San Francisco, claims the construction and arrangement of an improved slop hopper, connected with a bowl or pan, the whole placed upon legs or standards, and arranged as described in his application. This invention has already been fully described in this paper.

PADDLE WHEEL.—Adolph Heuston, San Francisco, California, claims a new invention a combination of the paddle with pivots and books, stop, lever, and regulator, and for the purposes there specified.

THROTTLE VALVE.—Warren P. Miller, of San Francisco, claims a valve made to operate in a case by means of a weight, substantially as shown and described in his application.

GANG PLOW.—James W. Donaldson, Daniel Sheets, and Allen C. Miller, Suisun, California, claim a peculiar construction of a frame for a gang plow, by which a greater degree of strength is obtained. They also claim this manner of attaching the plows to their respective portions of the frame, by means of bent braces, etc. Also an adjustable wheel and scraper, with other fixed wheels, turn-plates, connecting rods, bars, etc.

MANUFACTURE OF ILLUMINATING GAS.—H. D. Green, Portland, Oregon, claims the manufacture of illuminating gas from coal and sawdust combined, and subjected to destructive distillation, substantially after the manner described.

FASTENING FOR CARPETS, ETC.—Christopher Gullinan, Poughkeepsie, N. Y.: This invention consists in the arrangement of flat or concave rods which are provided with teeth bent down from one or both edges in combination with screws or other suitable means for fastening the same to the floor, so that by such rods a carpet or any other textile or flexible fabric can be readily stretched and held in position, and by removing the rods the carpet or other article can be taken up without injury.

VALVE FOR WATER-SUPPLY PIPES.—Wm. Kearney, Belleville, N. J.: The object of this invention is to obtain a valve for water-supply pipes, which will not be rendered inoperative by means of stones, sticks, or other foreign substances interposing themselves between the valve and its seat. The invention has also for its object the ready starting of the valve under a heavy pressure of water, and a quick and rapid movement of the valve after the same has been started, and a suitable provision made for the escape of air from the valve-chest, and to prevent the freezing up of the valve in its chest.

LAP JOINT FOR BELTING.—Henry Underwood, New York city: The object of this invention is to furnish an improved lap joint, by the use of which a belt of nearly uniform thickness and strength may be produced, and at the same time the amount of stock used may be economized.

IRON FOUNDERS' CLEANING MILL.—Stephen D. Horton, Peekskill, N. Y.: The object of this invention is to furnish an improved cleaning mill by means of which the metal remaining in the material left in the furnace, when the melted metal is drawn off, after being crushed or ground, may be separated from the dirt readily and without waste of the metal.

MACHINE FOR BORING WELLS, ETC.—Colin Mather, Manchester, Eng.: This invention relates to a machine for boring wells or other bores in the ground, in which a flat drill rope or band is used, in contradistinction to the ordinary round rope and metal rods, the drill being arranged in such a manner that it makes a part of a revolution after each blow. The drill rope extends over a pulley which is secured to the top end of a piston rod, to which a rising and falling motion is imparted by the action of steam on a piston fitted into a suitable cylinder.

SAND PUMP.—Colin Mather, Manchester, Eng.: The sand or shell pump is provided with a cylindrical barrel similar to that of an ordinary pump, and provided at its lower end with a valve or clack opening upward, somewhat similar to that in ordinary pumps, but instead of being fastened to the cylinder, its seating is an annular frame, which is drawn up against the end of the cylinder by a rod passing up to a wrought iron guide or bridge at the top, where it is finally secured by a cotter or key.

BURNING FLUID.—John Jann, New Windsor, Md.: This invention consists of a composition of benzine 33 gallons, sweet oil half a pint, and oil of vitriol two quarts.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE.

DEWEY & CO.,
Patent Agents, 505 Clay street, San Francisco.

HUNGERFORD'S IMPROVED CONCENTRATOR,

FIG. 1.

For Saving Gold, Sulphurets, Quicksilver, Etc.

FIG. 2.

have been tried, and many abandoned; all of which have been unable, so far, to attain a profitable separation, and meet the requirement of the mining interest, so well as that now patented by Mr. Hungerford, which is an improvement on the well-known Hungerford & Prater Concentrator, with which his name is already so familiar.

The separating or concentrating action is obtained by centrifugal force and gravitation; the pulp being preserved by water in the proper condition for the operation, and the pan so constructed, mechanically, as to allow the centrifugal force and gravity to expend themselves to the best advantage in producing the separation, as well as to make the machine simple, compact, and easily kept in order.

Fig. No. 1 is a perspective view of the Concentrator while in operation, showing the general arrangement. Fig. No. 2 is a section through the centre of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

Its operation is as follows: The pulp flows from the spout through the filter into the bowl at the top, from which it is distributed equally over the convex cover into the pan near its outer edge. The lightest sand is at once carried off with the overflowing water through the centre opening, and the sulphurets are allowed, from the motion given to the machine, to gravitate to the bottom toward the outer edge, forming an embankment all around the pan, as represented at 1, 1, Fig. 2. The lighter particles of the sand arrange themselves on the top at 2, 2, Fig. 2, from which they are being constantly washed away with the water flowing through the central opening. The sulphurets are, by the centrifugal motion of the machine, made to pass through small openings at the bottom, at intervals of a few inches around the circumference, through the inner wall of the pan to the circular trough, 3, 3, Fig. 2, where they come in contact with the mercury at the bottom, depositing the free metal, from which it is drawn at pleasure by an opening in the bottom, and the sulphurets, in the order of their density, by openings in the sides.

It will be observed that the sulphurets in the trough, 3, 3, are maintained at the same elevation as the sulphurets and overlying sand in the body of the pan. It will be further observed, that by no possible means can the sand in the latter pass to the former in such quantities as to form any considerable percentage of the amount saved. The advantages of this improved pan are continuous action, requiring no attention except to remove the receiving vessels as fast as they are filled from the openings shown on the right of Fig. 2, simplicity in construction, and durability and cheapness of cost.

The pan derives its motion from two eccentrics secured on a horizontal shaft passing across and below the centre of the pan and working between two pairs of adjustable wooden guide blocks or bearings. The eccentrics are so made as to bear equally on the wooden guide blocks in all positions while in motion; giving to the pan the most desirable motion for its purpose, and doing away with all complexity of rods, cranks, wooden frame, etc.

These pans are now being introduced into the best mills in the country. Reference to parties who have tested them can be had by applying to the manufacturers.

Those interested in mining, and who call at the Miners' Foundry to see the one which is there in operation, will have no reason to regret their visit.

WOOD'S SAFETY BOILER FEEDER.

The invention herewith illustrated was invented and patented sometime since by Mr. Wood, of Utica, N. Y. Every engineer will admit the want that has long existed for some simple but reliable instrument for governing the height of water in steam boilers, showing the true water-level in the boilers, starting the pump as soon as the water becomes low, and

stopping its operations when a sufficient supply has been injected. The inventor of this feeder claims to have accomplished these objects, thereby removing the danger of explosions resulting from low water. One of these patent boiler feeders, and the first sent to this coast, was recently received at Stoddard's Iron Works, 114 Beale street, where the same can be seen by mechanics and others who may desire to examine it. The patentee gives the following description of this device:

"The feeder is eighteen inches in height by five inches in diameter, and is connected to the boiler by two steam pipes, one passing into the steam chamber of the boiler and the other into the water. This forms an equilibrium, so that the water stands at the same height in the feeder as it does in the boiler. When the water reaches a certain point in the boiler, steam is admitted to the cylinder at the top of the feeder, forcing up the piston. To this piston a chain is attached, (as seen in the cut.) This chain is connected with a belt shipper, clutch, cock, or other means of controlling the pump in such a manner that when the rod is at its extreme height, the pump will be in operation. When the water again reaches the proper height in the boiler, the steam exhausts from the cylinder of the feeder in a vapor, through a whistle which is attached to the feeder, and the piston is forced back to its place by a weight which is attached for the purpose, and thus shifts the belt or other means

of controlling the pump, and stops it. Should the pump, from any cause, fail to supply water to the boiler when it is working, the water falling lower in the boiler opens a valve which is connected with the whistle on the feeder, sounding a shrill alarm until the defect is remedied. The vapor which passes through the whistle when the cylinder exhausts, keeps it free from obstructions, so that it cannot become foul and prevent it from whistling. If it is desired to add an extra supply of water to leave in the boiler over night, a cock in the feeder can be closed, and the pump will start and work until the cock is opened. On the side of the feeder is attached a water gong, with a glass tube, by which is seen the actual height of the water in the boiler."

[Written for the Mining and Scientific Press.]

California Petroleum.

Under the above caption, the *Alta* of the 22d instant has an article, which more than usually abounds in errors and misstatements, even when a more than usual liberal allowance is made for technical items which appear in a newspaper. It is not true that Mr. Charles Stott is the first who produced "the only pure oil of petroleum ever extracted" (on this coast, we presume, is meant). We are assured that such was effected, on a manufacturing scale, so long ago as 1860, by a gentleman well known to the readers of the *MINING AND SCIENTIFIC PRESS* and to the California public generally. The burning oil so made, we have been assured by those who saw it, was of a quality equal to anything imported from the East or made here subsequently by others from the native article. The heavier or lubricating oil so obtained was tried first on the machinery of the Sutter Iron Works, at that time owned by Mr. Gluyas, the present Chief Engineer of the California Steam Navigation Co., who continued to use the same, for lubricating purposes, until he left the works named. So successful was the latter, that a gentleman now engaged in the oil trade has continued preparing the same, by a modified method, especially adapted for machinery purposes, up to the present time, and we understand this article is now being extensively used by several of the principal mills at Washoe and other mining districts.

We would like to have the explanation in detail of the writer of the article under notice, respecting the following piece of scientific sustenance:

"The petroleum of the South are almost inseparable from their combinations, and are the most intractable of all the crude oils found in America. Iron, sulphur, iodine, nitrogen, arsenic, and other materials, impregnate them, and baffle the skill of all, as heretofore applied."

What we wish to be informed of is, the amount, by weight, contained in any given quantity of California petroleum (say 2,000 pounds), of each of the substances mentioned—iron, sulphur, iodine, nitrogen and arsenic—and the rationale of their injurious influence, if any. The fact is, however, that the whole of the substances alluded to form an aggregate so minute that even if their presence, alone or combined, are ever so prejudicial, the total injury could not amount to anything serious, owing to their being present only in what may be termed an infinitesimal quantity.

We also deny that either Mr. Stott or any

other man can possibly separate a pure burning oil from the southern petroleum by a still, such as described, accompanied by the employment of steam and cold water only. If as is stated in the paragraph under notice, a temperature of only 250° is employed, that temperature will only cause to be evaporated hydro-carbon susceptible of evaporation at that degree of heat, accompanied, as is invariably the case, by a small amount of hydro-carbon requiring a higher temperature, being carried over at the same time, and could, if required, be separated by subsequent fractionation. The species of still, described as the invention of Mr. Stott, appears to be similar to that many years ago patented and employed by the late and unfortunate Blatchford Mansfield. Conversing with those practically acquainted with the subject, we are assured that at a temperature of 250°, even with the use of steam as an agent, not more than 20 per cent. of light or burning oil could be procured from the petroleum obtained from the Southern coast. *

GENIUS IN DISTRESS.—According to the *London Mining Journal*, Mr. William Jones and W. H. Jones of Woolwich, father and son, the former of whom spent the princely sum of one million of dollars in scientific engineering labors to establish the practicability of railroads, and who finally founded the railway system of England, is now living in abject poverty, dependent upon charity for the most ordinary comforts of life. If one calls upon him, he cannot even bid his visitor to "take a chair," because that cheap and ordinary piece of household furniture is not included among his household goods. The *Journal* calls upon the thousands who have made fortunes out of railway traffic, to remember the venerable genius who devoted his early fortune and the prime of his life to bringing into practical utility this most magnificent of all the results of modern engineering, and to tender to him that substantial sympathy, the remembrance of which will be to them through all after life, a perpetual source of satisfaction.

CHEMICAL NOMENCLATURE.—The terms "sulphate of sodium," "carbonate of calcium," etc., are now used by chemists. This shows the adoption of Regnault's "binary theory" of acids, etc., and is not the only instance in which the suggestions of that master mind have given shape to the accepted theory of chemistry. Sulphuric acid must now be regarded as H SO₄, instead of SO₃, or SO₃ HO, for the "hydrated" acid; thus becoming a hydrogen acid, similar to the hydrochloric acid, in which the compound substance SO₄ takes the place of the Cl in the latter; and hydrogen has supplanted oxygen as the theoretical acidifying principle.

COMSTOCK LEDGE.—The *Gold Hill News* of a late date says: More ore has been extracted from the Comstock ledge, this month, than at any time for a like period since the discovery of metal in Nevada. We do not know of a quartz mill in good repair that is idle, and we do know that all mills that have achieved a reputation for good, honest work, are in great demand.

IMPROVEMENT IN STEAM BOILERS.

We were recently shown by Mr. John Lochhead, of this city, a new plan, of his invention, for constructing steam boilers, which we deem worthy of special mention. It is formed of 1/2-inch cast iron tubes, three inches in diameter. At the ends and in the center, the tubes are expanded into small square chambers, forming both a support for the tubes themselves and a means of intercommunication from one to the other. When placed in position, one above the other, the apertures form open channels at the ends and center from top to bottom of the whole boiler, which is composed entirely of several layers of these pipes placed one over the other. Being uniform in manufacture, the tubes are bolted together with thin layers of packing, perfectly steam tight. The boiler shown us measured six feet six inches in length, three feet in height, and fifteen inches in width. It is intended to be filled about two-thirds full of water. The fire being applied beneath, the flames and heat pass up between the tubes, which are arranged so as to afford a draft directly over their surfaces. The heat being the greatest in the center, the steam passes up through the central column of apertures in the tubes; the cooler water flowing from their extremities towards the center, and thence upwards, establishes a circulating current through the entire boiler, bringing the cooler portion of the water in constant succession to the hottest portion of the boiler, from which point it is immediately sent up to discharge its steam. It is claimed by the inventor that this movement of the water in the boiler arrests, in a great degree, the incrustation or scale, which takes place the more readily, in proportion as the water approaches to a condition of rest.

The construction of boilers on this principle—which is, in reality, an improvement upon the Harrison boiler—must avoid much of the danger and expense of explosions to which the ordinary boiler is liable. Being compact, it saves room. It can be easily removed and packed to any mine, however remote or difficult of access. We believe there is a general looking forward by engineers for some new and improved method of generating steam and holding it to a higher and consequently more efficient pressure. Hence the interest felt, at the present time, in this and all other intelligent efforts to accomplish the end so earnestly desired by all.

A boiler on a plan similar to the one above described has been made by Mr. Lochhead for a small propeller for the Northern Telegraph Expedition, and we hope ere long to be able to report its practical success.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The New Gold-Working Process in Mariposa.

EDITORS PRESS:—Having seen in your valuable journal some remarks on the new process of reduction and amalgamation of gold quartz, now being used on the Mariposa estate; which has produced such wonderful results, and as you are rather skeptical, and seem to think that these reports must be received "with many grains of allowance," will you allow me to say a few words on the subject?

I have satisfied myself that these reports are strictly true, and that the results obtained were from a fair average of the rock. I need not tell you that both practical and scientific miners have long been convinced that some more effectual mode of reduction, either independent of or in connection with stamps, must be adopted, and some more perfect amalgamation resorted to; for they are not content to plod along in the old way, knowing as they do that they are not saving more than one-half the gold which the rock is known by chemical assay to contain.

In Colorado Territory this is particularly the case. Rock assaying from one to two hundred dollars per ton has not yielded by working process twenty per cent. of that amount. Many capitalists, deceived by rich assays, have invested hundreds of thousands of dollars in stamp mills, pans, and other machinery, which is now lying there perfectly useless.

A knowledge of these facts has stimulated the ingenuity of many parties to find a remedy for this great waste of the precious metal. Repeated experiments have proved that quartz, to be successfully treated, must be reduced *fine and dry*.

The machine now being used on the Mariposa estate is known as the "Lundgren Pulverizer." It takes its name from the inventor, a Swede, who has patented it in Sweden, France, England, and the United States. The original object of the machine was to reduce all hard substances known and used in the arts, which required to be reduced to a dry, impalpable powder. These machines have long been in general use for that purpose. More than five thousand are used in Paris by chemists, druggists and manufacturers.

The attention of some gentlemen in New York being called to it, and believing it could be applied to quartz crushing, experimented upon it with great success. It was found in the course of these experiments that it was capable of reducing the hardest kind of rock finer, more expeditiously, and with less motive power, than by any method of wet crushing yet known. Its construction is simple, being merely an iron cylinder, of the proper size, suspended and revolving on a shaft through its center. It is loaded with the proper proportions of chilled iron balls, of about an ounce weight, and quartz rock; the rock having been previously partially reduced by rollers, or any convenient crusher. The cylinder, while pulverizing, is air-tight. The usual time of reducing a charge is one hour, which includes the time of loading and discharging. The amount of a charge is in proportion to the size of the machine.

A 5-foot machine, requiring a 5-horse power to drive it, will reduce from seven to eight tons in twenty-four hours, fine enough to pass through a wire screen of "100," being ten thousand holes to the square inch. The quartz is thus reduced to an almost impalpable powder. One thousand to twelve hundred pounds of rock so prepared is placed in a close iron amalgamator, in which superheated steam is applied to it for fifteen to thirty minutes, which drives off all impurities that tend to check amalgamation. The quicksilver is then added to the mass, which is of such intense heat that the quicksilver becomes vapor, and in five minutes thoroughly impregnates it. A cold bath at the top condenses the vaporized quicksilver, which then falls to the bottom, carrying the gold with it. The amalgam is then washed

on a shaking table of a peculiar construction (the movement of which closely resembles the under-tow of the sea), by which none of the quicksilver or amalgam is lost.

Every one knows that the great success of any amalgamator depends on the facility with which it brings the fine particles of gold into contact with the quicksilver; and all who know the power of the vapor of mercury, are aware that it is easier to force that vapor through a mass of pulverized quartz than to bring light particles of gold through water to a body of quicksilver. This is, indeed, reversing the ordinary mode; for instead of using mechanical contrivances to bring the gold within the reach of the quicksilver, the quicksilver is evaporated and is sent in search of the gold. There will probably be many improvements made to this process, but the results show that up to this time no other method so effectual has been applied.

Now, if quartz rock can be so thoroughly disintegrated, and subsequently amalgamated in a close vessel, there is no good reason for the great loss usually attending the working of auriferous quartz. And if this new process is all that it is claimed to be, we ought not to be surprised at this increased yield; and may reasonably believe that many mines that have been abandoned as unprofitable, may be worked to advantage by this new process. A large amount of money has been expended on new processes which have proved abortions, and this like all others will stand or fall on its own merits. The writer of this has no pecuniary interest in the Mariposa or any other mine, but is simply desirous of advancing the quartz mining interest of this State. H.

[Written for the Mining and Scientific Press.]

Letter from Austin, Nevada.

EDITORS PRESS:—I tender you an apology for my neglect of you for some time back, and once more ask a space in your columns. Our section (Austin and immediate vicinity), in gross, is not producing what it should, owing to the fact that many men of incapability are at the head of mining. The present aspect of affairs indicates a dull winter here. My reason for so stating, is the inactivity of large mining corporations. "Why their inactivity?" is asked by all new comers, as well as by those expecting favorable returns from their investments. There are millions of dollars expended in this immediate vicinity. "In what?" In mills. "Mills to do what?" To reduce ores. "Where are those ores?" Still buried in Lander Hill and adjoining hills. "Why are our mines not so worked that they will produce ore sufficient to keep these mills from rusting to decay in idleness?" Ask the miner, he who can judge of a mine; who can, through long and varied experience in mining, form at least a reasonable idea of the whereabouts of a deposit, and who, when it is found, can extract the ores therefrom, without increasing indebtedness over the value of the ores. He will tell you, that all this defect which is believed to be in our mines, is the fault of, and should be charged up to corporations—to the managers of them, to those who are sent here to further works in which there are hundreds of thousands of dollars invested, and much more at stake; but who, to our disadvantage, are entirely ignorant of the requirements necessary for one filling their positions.

We are again asked, "why our mines do not produce bullion?" They do produce bullion, as far as they are properly managed; but further than those so worked, none would vouch for, except one ignorant of mining, or an over sanguine Eastern speculator.

We must therefore await the action of the owners of our mines; we must wait until they can see that it requires a miner in a mine to make it produce, and also that one great secret of making a mine net, is to curtail unnecessary expense. A mine must be of the first order that can pay salaries to officers of \$25,000 per year, or more. The custom has been, and still exists here, to have at least four good salaried officers at the mine: 1st, general superintendent; 2d, the superintendent's assistant; 3d, a helper for the assistant;

4th, book keeper, and last and least, a boy on horse-back to wait on the quartette. It reminds me much of the boy, who being caught in idleness, was asked "What he was doing?" answered "that he was helping his companion." "When asked what his companion was doing?" answered, "that he was doing nothing." So it is with all officers in our "well incorporated companies." Then, in addition to these officers, there must be presidents, trustees and secretaries in the "big office" at the East, all drawing pay. Now I ask any man of reasoning mind, if any mine in embryo, or even fully developed, can live and keep out of the sheriffs' hands under such a weight of extravagance, and all unnecessary? Why not curtail this expense at least 50 per cent. by preventing these folks from helping each other do nothing, and give our mines a chance to pay.

If the companies are afraid their employees will appropriate their money to their own uses, the more they would have to appropriate, each one to keep up his quota of extravagance, let them send out here "one man," one that they can place confidence in, for honesty and ability as a financier; let him be called "Financial Agent," give him instructions to engage a practical miner to work the mine, but be careful that he is instructed not to engage either a watch-maker, dentist or "any other man," for a miner, except one who has mined. From the miner he can learn and improve in knowledge of mining himself; he can be told, with some certainty by him whether the mine is worth working or not. If not, will advise him to try another one. There are thousands of dollars sunk in "inclines" about these hills, (all partial to inclines here) in following after seams of clay (clay being indicative of a ledge, "so say" experts—imported ones), better use these thousands in working in and on a body of quartz, even if it will not assay twenty or thirty thousand dollars, (or thereabouts) than be "poking about" several hundred feet under ground in a seam of clay, just because there is a "splendid smooth wall" visible at times.

I will say here in apology (with all due respect) to those of our superintendents who feel offended at my scrutiny of, and comments on their workings, that I comment as I do with the motive alone of improving them; and if the "shoe does pinch them a little," they must not get "riled," for in so doing, they will certainly convict themselves.

Now there is another idea, which, if the men here and elsewhere would look at and study into, can be made very advantageous to those of the enterprise, as well as to our section in general. I suggest this idea to counteract the effect of, and to improve on, this incline system. Lander Hill has a belt of veins, or feeders, passing through it, which are very numerous, running parallel with each other, and, at places, within a few feet of each other, each owned by different parties, each party following his own vein down after his own fashion, both eventually clashing, then throwing away the proceeds of their labor in litigation, which, when through with, they have no money, and the legal gentlemen have the mines. Nevertheless if all these small rich veins could be combined in one grand enterprise, whereby they could be worked through one common channel, and under one direction, would it not save much individual expense? Such will be done eventually, and when brought into action will astonish us all, to wit: Sink a perpendicular shaft at some given point on this belt or series of veins to a great depth—say 750 or 1,000 feet; make the shaft commodious, timber it well and securely, so that it will last for time; sink to a depth greater than any others have sunk or can sink, so that there will be no conflict, when, having gained the desired depth, start drifts, and run them at right angles with and across or through all these veins that come in the way of the tunnels. Extract, mill the ores from all these veins so found, and appropriate the bullion to the company.

These veins from which ores are extracted may not virtually belong to the enterprise, but they can easily become its property. When a claimant to one particular ledge charges that his ledge is being worked by the enterprise, and the proceeds applied "not to his benefit," he cannot prove that it is his ledge—he does not have the means to sink to that great depth—but the enterprise will give the claimant a chance that it may be his by purchasing it of him at reasonable figures, or by so many shares of stock in the enterprise. So in this manner, with but one single vein to commence with, title can be obtained to most of the hill. In my opinion it is the only practical way to work this hill, and is the plan that must and will be adopted, sooner or later. It will cost no more to do this work than it has cost many mines on the hill in hammering away, "gophering," and doing nothing.

Some of our mines are turning out bullion.

The Great Eastern, Savage, Diana, Morgan and Muncie, North Star, and Tunko, are the principal ones. The Keystone and California mills are running regularly, and the Ware mill at intervals; also the Cortez mill, and Buel's mill at Belmont (Philadelphia District). The latter two are sending in bullion almost daily, and are doing remarkably well.

Bullion shipments for the month of August were \$71,059. That for the month of September were \$77,172.72. Still not as large as we would wish. PROGRESS.

Austin, October 12th, 1866.

[Written for the Mining and Scientific Press.]

From Sierra County.

BY AN INDEPENDENT CONTRIBUTOR.

[Continued from page 211.]

EDITORS PRESS:—From the Sierra Buttes Copper mine previously described, and following the granitic belt in which it occurs, south-erly to the crest of the dividing ridge of the waters of the Northerly and Middle Forks of the North Yuba, over a country densely covered with timber, we notice frequent indications of metalliferous veins, and a "big thing" of the grizzly order and bearish manners (*versus hominilis*). Our mules either not liking the odor of his bearship, or his uncivil salutation in the way of a civil growl, came to the sage conclusion that "discretion was the better part of valor," and bent a retreat, which we ingloriously seconded to the best of our ability. Following the divide westerly down the ridge for some two miles, the formation suddenly changed to a volcanic tuff, filling a declivity in the ridge, and extending for about 3,000 feet, when granite intervenes. Underlying this bed of volcanic material some 500 feet, sedimentary beds of stratified sandstones and clay were seen slightly dipping to a common center, under which, and on the formation, which is in places denuded of soil, the ordinary water-worn gravel and boulder deposit usually found in river beds is seen, containing more quartz, however, than is found in the present river channels, affording unmistakable evidence of its having been the remains of an ancient river of considerable width, which flowed from the north in a southerly direction, and contrary to the present river system; the Yuba river having in its westerly course eroded its almost indestructible volcanic covering down through its granitic walls, scattering its contents, and cutting a still deeper gorge of some 1,500 or 2,000 feet below its bed; thence northerly, re-crossing the river and following a deep canon to its source on the northerly divide. We find similar indications of river deposits, covered by breccia and tuff. From its apparent course it would have taken its rise in the direction of the volcanic peaks in Plumas county. The ravines in this vicinity are said to prospect well. But very little prospecting, however, has been done so far up in the mountain chain, and no systematic explorations. Were the same indications found at the North Pole, it is quite possible they would have been thoroughly tested before this. To the westward, about three miles, is seen the Sierra Buttes, its pinnacled and serrated peaks sharply cutting the horizon, its precipitous and rugged cliffs rising with nearly perpendicular walls for nearly 2,000 feet, a small lake lying in a declivity or nook in the rock under one of its most inaccessible cliffs. To the right (northerly) the country flattens out, forming table land or small plateaus, heavily timbered, said to contain some 30 or 40 small lakes, well stocked with mountain trout. From our standpoint four lakes were visible. The waters of the Feather and Yuba rivers here join hands and take a drink before bidding each other God speed on their downward journey to the father of waters. After admiring the beauty and grandeur of the scenery—which I have made, but a feeble attempt, to portray—a few hours' ride finds us under the hospitable roof of the gentlemanly manager of the Sierra Buttes mine, who, with his courteous assistant, Mr. W. Farrish, not only welcome us to their mountain home, but promise to-morrow to show us one of the best mines in the State. *Nous verrons.* VIAADOR.

Your compositors make me tell some queer stories occasionally. In my last communication, "for 49 per cent. gold per ton," read: \$49 per ton. For "with the depth the ores increase in richness and will average 50 per cent.," read: In depth the ores increase in richness and will average 50 per cent. copper."

[We convict the compositor in the second degree for the first error, but the last was clearly an omission in the manuscript.—Eps.]

Mechanical.

Ancient Workers in Iron.

It is probable that the first manufactured iron ever produced was in the form of malleable iron, highly carbonized, in consequence of the manner of its production. The method employed in this day by the natives of Central Africa, for producing iron, is supposed to be substantially identical with that of the most ancient workers in that metal. This method is described as follows: A circular furnace of clay, about ten feet high by three in diameter is constructed, near the hearth of which and through several tubes of clay, used as tuyeres, air is forced, generally by blowing with a kind of bellows made of a goat skin. A charcoal fire is made upon the hearth, upon which a stratum of ore is placed. Charcoal is subsequently added, from time to time, as occasion requires and the fire kept up by a continual blast, for about three days, when the whole is allowed to cool, and a portion of the furnace taken down to obtain the iron, which is found in a irregular mass upon the hearth. This mass is sonorous, and when broken presents a granulated appearance like steel. It is in this condition fit to be directly wrought, by forging, into ordinary cutlery. Being highly carbonized, it possesses the quality of steel. The African smith refuses to use English iron, which he characterizes as "rotten" compared with his own.

The Hadon iron smelter, also, to this day builds his furnace and obtains his iron in the same manner. The lump of iron thus produced is called *wootz*, and is said to be of a quality which the most expert manufacturer of Europe cannot equal. Out of this *wootz*, by a subsequent melting and refining, in the presence of carbonaceous matter, the finest Indian sword-blades are made, the wonderful temper of which, as of the Damascus blades, European artisans have never been able to equal.

The ancient metallurgists entertained the idea that by burying iron in the earth until the greater part of it was converted into rust, the remainder was the better prepared for being forged into weapons, etc. This idea still prevails, and the custom is practiced to this day in Japan. However much experience may seem to warrant the practice, science fails to find any reason for it. Some of the old English Sheffield cutlers, who were famous years ago for turning out the most superior cutlery of their day, were in the habit of placing their bundles of steel, before being worked, in the mud of some water course, where they were suffered to remain for some weeks, under the impression that by this process they were greatly improved. Science is again at fault to discover the *raisonne*. Yet it is stated that on removing the piles of Old London Bridge, the wrought iron of which they were made was found to be of such superior quality that a celebrated cutler bought up many tons of it for conversion into steel, he claiming that the action of moist clay upon it, without exposure to the atmosphere, had produced such an effect as to render it almost equal to steel.

TEMPERING STEEL.—In hardening steel it will sometimes crack when suddenly plunged into cold water. To prevent this result, the surface should be covered with a paste of flour and powdered prussiate of potash, then dried. The steel should then be raised to a low red heat, in a clear fire, then plunged into cold water. It will come out perfectly free from cracks. In hardening articles of steel, the cracking is most generally cured by heating to a rather high temperature before plunging into cold water. The above process will steel the surfaces of iron journals, such as those of wagon axles, etc.

AN ALLOY composed of ten per cent. aluminum and ninety per cent. of copper, resembles gold in color, and takes a polish equal to steel. In these proportions, this alloy is said to be a chemical, and not a mere mechanical compound, like most of the brasses and bronzes. This alloy is now used with much success in France, for the bearing boxes of locomotives.

A VERY CURIOUS CASE OF EXPANSION was observed and explained some years ago, by the Rev. Canon Mosely. The choir of Bristol Cathedral, in England, had been covered with sheet lead, the length of the covering being sixty feet, and its width nineteen feet. In two years after it was laid on—viz. in 1853—it had moved bodily down or lengthwise a distance of eighteen inches. The descent had been noticed for some time as proceeding gradually, and efforts had been made without success, to arrest its progress by driving nails through it into the roofing. The force with which the lead descended was sufficient to draw out the nails. The roof was one of gentle descent—and one on which the lead would not have slid, by gravity, even if it had been placed there without any attachment to the wood work.

What was the cause of the descent? Simply this: The metal was exposed to the varying temperatures of day and night. During the day the heat imparted to it caused it to expand. Had it lain upon a horizontal surface, it would have expanded equally all round; but as it lay upon an inclined surface, it expanded more freely downwards than upwards.

The entire spread of metal was upon one declivity of the roof. Had the roof been flat, as already intimated, the contraction at night would have brought the expansion of each day back to its starting point; but being on an incline the chief portion of the expansion of each day was taken up by the night's contraction in a downward direction. Its motion, therefore, was much like that of the common earth-worm, it pushed its lower edge forward during the day, and drew its upper edge after it during the night, and thus by degrees was actually crawling off from the roof! It had crawled eighteen inches in two years. Had it been secured by a sufficient number of nails, or by any means so as to have held its weight in a perpendicular position, it would not have moved, except by alternate expansions and contractions from and to the same points.

CORK SPRINGS.—For many mechanical uses it is often found necessary to employ springs of great power and elasticity, such, for instance, as will break down the elasticity of India rubber. For such severe work, cork has recently been found the most reliable substance. The cork used for these springs is of the commonest description, harsh, hard, and full of fissures. It is cut into disks of about eighteen inches diameter, each pierced with a central hole. Previous, however, to cutting, it is soaked in a mixture of molasses and water, which gives it some softness and renders it permanently moist. These cork disks are placed in a cylindrical cast iron box, a flat iron lid or disk is placed over them, and by hydraulic pressure they are forced down, so as to reduce the thickness to one-half. A bolt is then run through box, corks, and cover at the center, and a nut being screwed on holds all in place, when the press is relieved and the box of compressed cork, disk, or cork spring is ready for use. One of these springs, placed in a testing machine under a weight of 20,000 pounds, showed an elasticity suggestive of compressed air. A pressure which destroys India rubber, causing it to split up and lose its elasticity, leaves the cork unimpaired, and it has been impossible, with any pressure hitherto attainable, to injure the cork, even when areas of but one inch were acted upon. Mr. W. Sellers, an English machinist, has had for some five years a forging machine in which a spring of the form and material above described was subjected to continual and violent shocks, and its performance had been most satisfactory, with no signs of deterioration.

WARLIKE INVENTIONS.—Among other tremendous machines recently patented in France are: An electrical mortar; a steam cannon to pour forth a hail of shells and cannon balls for an hour without ceasing; a steam field-gun; a rifled carbine, to fire thirty shots a minute (two men are required to carry it); and an infernal box belching forth a thousand balls, and intended to annihilate a whole regiment at a blow.

ARCHAEOLOGICAL floors of concrete, or beton, a mixture of broken stone, sand and hydraulic cement, are being put down in Paris without any support of vaults, girders, or the like. The material is simply packed in or molded on timber centerings, which are withdrawn when the concrete has "set."

Scientific Miscellany.

THE ANOMALIES OF NATURE.—Nature, as developed by the progress of human knowledge, is full of anomalies, which no foresight can predict, and which experiment alone can reveal. Until within a few years, man rested in the conclusion that heat always produces contraction, with the single exception of water, which exception has been regarded as a providential provision, without which the waters of the globe would have become vast seas of ice. Recent experimental research, however, has shown that the metal bismuth is also an exception. Other similar exceptions may yet be found. If metal be compressed, heat is developed; but if a metallic wire be stretched, cold is the result. This rule is supposed to be general; at least a very large number of experiments have as yet revealed no exceptions, so far as the metals are concerned. In applying the rule to organic substances, one single exception only has as yet been discovered, although there may be others which future experiments will reveal. The exception alluded to is India-rubber; a thin strip of which, say three inches long and half an inch wide, develops a degree of heat strongly affecting the thermo-electric pile. The converse of this is also true; for while a strip of metal will expand on being heated, India-rubber sensibly contracts on the application of heat. Thus in the physical world, as well as in the moral, acts are never isolated. As in the moral, one deviation from an established rule invariably brings with it others as consequences; so it is in the physical. This is proven by the double deviation in the organism to which we have just referred.

ALCOHOL IN GINGER BEER.—At the present time of extreme ideas on the temperance question, it may be considered something of interest, beyond the scientific facts involved, to know that certain portions of alcohol are imbibed even in drinking a glass of "ginger-pop," and that he who would abstain entirely from alcoholic mixtures must not taste even that simple beverage. The more the beer is "up," as it is termed, the more certain it is that alcohol is present. It is well known that ginger beer is made with sugar, ginger, etc., and set to ferment before it is bottled. Now it is during the fermentation of the sugar that spirit is produced, and to show its presence it can be easily separated by distillation. In making this statement we merely wish to correct a popular error—that ginger beer is free from spirit.

NEW PRODUCE.—The editor of Decker's *Mining Record*, published at Melbourne, Australia, has had shown to him a sample of a singular deposit found between Mount Gambier and the Coorong. In appearance it is exceedingly like India-rubber, and in some respects it is said to be similar to what is called native bitumen. There is a considerable deposit of it, and it is got from a little below the surface.—*Exchange*.

A similar substance is found in this State, which we presume is identical in character with the above. It is highly plastic. Under the warmth of the hand it may be worked and drawn, like molasses candy in the "pulling" process. It has the color and smell of bitumen, and is probably a modification of that well known substance. It undoubtedly contains a large percentage of paraffine, and probably less oxygen than bitumen.

ARTIFICIAL SALTPETRE.—Mr. J. Bernhard, of Paris, has recently produced an artificial saltpetre by a process which at the same time yields, as by-products, white lead and ammonia. He proposes to mix 157 parts of nitrate of lead with 39 parts of carbonate of ammonia, to obtain carbonate of lead and nitrate of ammonia. To the nitrate of ammonia thus obtained he adds 28 parts of lime, by which nitrate of lime is produced and ammoniacal vapors given off, which are collected in the usual way. The nitrate of lime remaining is mixed with 87 parts of sulphate of potash, by which an insoluble sulphate of lime is formed, and a soluble nitrate of potash, which upon being concentrated yields saltpetre in crystals.

The mean annual of rain that falls at the equator is ninety-six inches.

PETROLEUM AND ASPHALTUM.—Linseed oil and several other vegetable oils have the property of absorbing oxygen, and combining with it chemically to form a resin. It is this property of drying oils which renders them suitable for paint.

Petroleum contains no oxygen. It is composed wholly of carbon and hydrogen, being a mechanical mixture of several hydro-carbons. Asphaltum is a resin, being composed of carbon, hydrogen and oxygen, and it has been suggested that asphaltum is produced by the conversion of petroleum into a resin by the slow absorption of oxygen. But this is a mere hypothesis. No one claims to have succeeded in converting petroleum into asphaltum. After months of exposure the oil remains without any appearance of resin even upon its surface. It is as reasonable to suppose that under certain conditions the vegetable matter is converted directly into asphaltum, as that it is first changed to petroleum and then to asphaltum. Asphaltum lakes may suggest the presence of petroleum in the vicinity, but they are no proof of its presence.

ERASING PENCIL MARKS WITH INDIA RUBBER.—The *New York Gas Light Journal* copies our explanation of the reason why India rubber erases pencil marks, and adds: "India rubber, when subjected to friction, becomes electrically excited, and attracts the particles of graphite (of which the pencil marks consist), when loosened by the abrasion of rubbing. Hence, a quick motion is more effective in removing pencil marks, because the electrical excitation and attraction is greater." Our explanation was substantially as follows: India rubber consists mainly of carbon; and when the carbon of the rubber is brought in close contact with the carbon of the pencil mark in the process of rubbing, the smaller quantity of carbon in the pencil mark is attracted by the larger mass of carbon in the rubber, and is thus removed from the paper.

SCIENTIFIC FACTS.—Assuming the temperature of the interior of the earth to increase uniformly at the rate of one degree to every forty-five feet, at the depth of sixty miles the degree of heat would be sufficient to fuse all known substances.

As much nitrate of soda as can be held between the thumb and fingers will preserve flowers for a fortnight.

Hydrate of lime will absorb very thoroughly the carbonic acid in ships' cabins and other close apartments.

It is stated that soap manufactured from coal oil will remove all kinds of stains and dirt.

INDESTRUCTIBLE BOTTLE LABELS.—Bottle labels may be made indestructible by coating them with white of eggs, and staining them until they become opaque, and then drying them in an oven at 212°. The albumen becomes hard and transparent, and is unaffected by oils or acids.

A single ounce of gunpowder, placed at an angle of forty-five degrees, is capable of projecting a twenty-four pound ball a distance of three hundred and fifty yards.

A few drops of a solution of permanganate of potassa, made of one drachm to one ounce of water, will instantly purify cistern water which is foul from decomposing organic matter.

A peculiar iron ore has been discovered in Ireland. It looks like plumbago, and leaves a greasy feel, but by analysis contains 91½ parts of ferrous oxide and 9½ of insoluble matter.

When ordinary steam is superheated, its expansion for the first five degrees is three times greater than that of air.

M. W. BALDWIN, of Tacony, Pennsylvania, died on Sept. 7th. This death is a notable one, inasmuch as Mr. Baldwin built, in 1829 the first locomotive constructed in this country. It was an experiment, and was a small affair, run upon a circular track laid down in the Arden, in Philadelphia. From that time he devoted himself to the business of locomotive building. His works increased in extent until they furnished employment to one thousand men. He occupied a prominent position, and was noted for his liberality.

THE GILA RIVER PLACERS are reported to prospect from one to three dollars to the pan "from the grass roots down." The *Denver News* of 5th October says that a company of five or six hundred persons will start from Santa Fe about January 1st, to explore those regions. The distance is some 400 miles. The danger from the Apaches is so great that such exploration would be impossible except to a large and well-armed party.

MINING SHAREHOLDERS' DIRECTORY

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the MINING AND SCIENTIFIC PRESS, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner.

DEWEY & Co.,
San Francisco, June, 1866. Patent Solicitors.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Owing to its general circulation, the MINING AND SCIENTIFIC PRESS has perhaps become a valuable and useful to the mining interests as that noted paper, the "London & Lancet," was to the medical profession, acting either as a scarifier when too great a plethora of mining bubbles prevailed, or as a styptic where dangerous bleeding of the pockets of the capitalists was concerned. [Copperopolis Courier, Oct. 13.]

JOB PRINTING

THE PEOPLE!

Mining and Scientific Press

JOB PRINTING OFFICE,
505 Clay Street,

(Southwest corner of Sansome street, on 2d floor.)
Formerly WATERS BROS. & CO.'S.

We are now prepared to offer customers the most favorable inducements to patronize our Book and Job Printing Establishment. Our office is supplied with an extensive assortment of Type, and the best style of Presses for good work and

CHEAP AND RAPID PRINTING.

Patrons will always find us well up to the times, ready to execute superior work, and furnish the same as cheap as any prompt and reliable firm in San Francisco.

Our aim is to suit our customers in regard to style and prices, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

We give especial attention, when desired, in assisting parties in making up or revising their copy. Particular care will always be given to the publication of

LAW BRIEFS, CERTIFICATES OF STOCK, MISCELLANEOUS BLANKS, BLANK BOOKS, MINING BLANKS, BOOKS, PAMPHLETS, CARDS, CIRCULARS, MINING REPORTS.

Orders from the interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages can be forwarded by mail at small expense.

City customers, or persons visiting an Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

DEWEY & Co., Proprietors,
Mining and Scientific Press Patent Agency, Newspaper and Job Printing Office,
505 Clay Street, San Francisco.

Commencement of Fourteenth Volume

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Editorial Expressions:

Following are some of the many opinions generously expressed by our neighbors:

MINING AND SCIENTIFIC PRESS.—The paper whose name we have just written, ranks among the leading scientific journals of the world. On mining matters it certainly has no equal, and more than all other causes combined, it has advanced the interests of the quartz miners of the Pacific Coast. Its editors are men of thorough education and large practical experience, and its list of contributors embraces many names distinguished in the various fields of scientific exploration and mechanical invention. The MINING AND SCIENTIFIC PRESS ought to circulate universally among intelligent Californians, to whom we most cordially commend it, and its traveling agent, O. P. Truesdell, who is now canvassing this city and county, and will shortly visit other countries in the southern part of the State, in its interest. [Stockton Daily Independent, Sept., 1866.]

"SULPHURET" and "Our Lady Correspondent," of the MINING PRESS, have each contributed an interesting article on Mines and Mining in Amador county. Hope they will keep up the fire. One of our subscribers complains that "Sulphuret" fell into an error, in stating that the sulphurets of the middle or Jackson range are richer than those on the upper or Pine Grove. He thinks it is just the reverse. [Amador Ledger.]

VOLUME TWELFTH.—The MINING AND SCIENTIFIC PRESS with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gait has been rapid toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and our word for it, volume thirteen will acknowledge receipt. [Golden Era.]

MINING AND SCIENTIFIC PRESS.—We received a visit a few days since, from Mr. Wood, agent for the MINING AND SCIENTIFIC PRESS, who is now canvassing this county for subscribers to that valuable journal. The Press is invaluable to miners and mechanics, being the only journal of any importance on the coast entirely devoted to their interests. [Mountain Messenger.]

STRENGTH FOR IT.—The large, illustrated sixty-four column weekly newspaper—the San Francisco MINING AND SCIENTIFIC PRESS—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a hint of most useful information to be gained on other way on mining matters generally. [Rocky Mountain News.]

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information in the pick and shovel fraternity. [Trinity Journal.]

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person who wishes to keep well posted on the developments of our State and the Territories. [Mountain Messenger.]

The MINING PRESS is particularly the miners' journal, and is doing more for the solid interests of the State than any other, by enabling its readers to unlock the mines of untold wealth which lie waste around them. [Mountain Messenger.]

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital here. [Calaveras Chronicle.]

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent. [Los Angeles News.]

Prof. J. D. Whitney's address on Mining, is given entire. * * * We preserve the Press, and would like to have a full file. [Napa Reporter.]

Friends pleased with our efforts in the publication of the PRESS can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the *Miner* of October 20th: The workmen in the Morning Star mine are now getting out large quantities of first and second class ores. The width of the vein of black and yellow ore is full twenty feet where they are now working. It is estimated that there is now on the dump, ready for hauling, over two hundred tons of ore.... The demand for horses in Monitor has never been so great as now since the exodus after the excitement of 1864.... The Mowyer has just now such hard rock that twenty-three shifts completed only ten feet.

The Silver Mountain *Bulletin* of October 20th says that ten days more will put the Washington mill in running order.

Amador County—

From the *Ledger* of October 20th: The Railroad company have completed their splendid new steam hoisting works. The shaft is now 305 feet deep—rock good.... The Eureka, with its sixty stamps and 1,200-foot shaft, goes night and day.... The Wildman, the mine that cost \$50,000 to prospect, is still yielding plenty of ten-dollar ore.... The New North extension of the Union, Smith & Patterson, shows plenty of free gold and good sulphurets.... The Mechanic is progressing slowly, but everybody seems to think it will prove valuable.... Tubbs & Ch. have struck a fine prospect near the Gate, and purpose rebuilding their San Andreas mill on the lode at an early day.... Dr. Wm. Sharp & Co. have expended a large sum in prospecting between the Gate and the Oneida. Some good rock has been found, but not enough, as yet, to give it a permanent value. The indications are that it is the same range with the Coney & Bigelow.... The Austrian, Steckler & Co., has been conditionally sold to Atchison & Co., of Washoe.... Pine Grove, Vaughn & Co., are driving a tunnel.... The Italian is still yielding good rock, and will show some big clean-ups as soon as there is rain enough to start the mill.... The Anacapa's air shaft is through. The boys saved about \$300, specimen rock, last week.... Paugh's mill is now going. He has about 600 tons of fine looking rock on hand. The shaft has now reached a depth of 115 feet.... In the Oneida a new and deeper level is now being run between the south and middle shaft, and the ore appears even better than usual.

The Spanish mine, located about two miles from Jackson, and owned by Fenton & Co., is proving very rich. They are now down 110 feet, with a wide vein, and the prospect gets better the deeper they go. We have been shown some specimens, taken out last Tuesday, that are full of free gold—one piece is completely speckled with it.

Calaveras County—

From the *Copperopolis Courier*, Oct. 20th: At Angel's, the 30-stamp quartz mill of Southall & Co., is nearly completed and ready for running. This is a first class mill in all respects. Messrs. Baker & Co., have been running their "reconstructed" mill of twenty stamps for the last two weeks with good success. Bowie & Co. run their mill night and day, having an inexhaustible supply of good paying rock. The mine of Stickle & Co., is also paying handsomely, the gold being equally diffused through a vein of ten feet in thickness. Angels presents a livelier appearance now than at any time for the past six years. The buildings are all occupied and everybody busy.

At Carson Hill, Davis & Co., are working the old Morgan claim, with a view of putting up a mill early next spring. They are taking out very rich rock, the vein being large and well defined. The mine is situated at the summit of Carson Hill, and on the mother lode of California.

El Dorado County—

The Folsom *Telegraph* of Oct. 20th, says: Hall, the proprietor of the Planters Hotel, at Shingle Springs, is now engaged in erecting a 10-stamp mill on the old Bassett claim, on Webber Hill, near Placerville, for the purpose of working cement. The claim is owned by Hall & Stewart.

Fresno County—

The Millerton correspondent of the *Viealia Delta* writes, Oct. 13th: The river miners are all ready to commence taking out dust on the San Joaquin with the first rise, and the diggings are promising well. The copper excitement still runs high, and new discoveries are continually reported.

The steamer *Cornelia* brought down on the 19th inst., 67 pigs (10,983 pounds) of copper from the Buchanan claim, Chowchilla, and 209 sacks of matt (29,718 pounds).

Kern County—

From the *Havilah Courier* Oct. 20th: We learn that the Alpine Gold and Silver Mining Company's 20-stamp mill, commenced opera-

tions on Monday, the 15th inst. This company have expended forty or fifty thousand dollars in the construction of their machinery and the opening of their mines, and now commences crushing rock under most favorable auspices. They have thirty or forty excellent lodes, ten of which are now thoroughly opened and developed.

The new 20-stamp mill of the Joe Walker mine was "inaugurated and christened" on the 17th inst. A general invitation to the citizens of Havilah was given by the owners, and nearly one hundred were present. A sumptuous refreshment table was prepared, and toasts in abundance were drunk to the success of the company.

We have seen a gentleman, well known to us, from Greenhorn Mountain, who has given us a glowing account of the mines of that locality. Among the valuable mines enumerated are the leads—Golden Star, Clipper, Excelsior, Ridge, Peacock, Burr Oak, etc., etc., owned by Messrs. John and James Lillie, formerly of this place. They have sunk down on four of their leads, from twenty to forty feet, and find that they increase in richness and size the deeper they go.

Nevada County—

From the *Gazette* of Oct. 22d: The shaft of Cring & Co., on Oustomah Hill, is about 90 feet deep, from which tunnels have been run south, east and north, about one hundred and fifty feet each way. As yet, no very rich gravel has been struck, but as far as their tunnels have been run, in either direction from the shaft, it prospects sufficiently well to warrant good wages.... The Banner mill will, we understand, be ready to start up again to-day. The Verney pans have been changed for the waltzing or planetary pan.

Same of 23d: The most extensive hydraulic mining in this county is carried on by the American Company, on Manzanita Hill, near North San Juen, and the machinery and contrivances for saving the gold are perhaps the most perfect. The bank or face of the diggings, in some places, is a hundred and eighty feet in height, and the bulk of the gravel is washed down and sluiced off by the hydraulic, and a portion, being cement, is crushed in an eight-stamp mill. The mill has been in operation only a few weeks, and yields from \$1,300 to \$3,000 for every two weeks' run. The drain tunnel was run through solid rock a distance of seventeen hundred feet. Sluices are placed through the entire length. These are cleaned up every two or three weeks, the gold being found the entire length, and the average yield is about \$10,000 for each clean-up. The Middle Yuha Canal Company own one-fourth of these diggings, the other three-fourths being owned by Spooner, Swan, Brown, Crall and Carmack.

The hoisting machinery lately removed from Willow Valley and erected on the Cunningham ledge, was started up a few days ago, and an incline shaft is now being sunk on the ledge. This will be carried to the depth of two hundred feet before starting drifts.... A ton and a half of pulp worked at Stiles' mill by the screw grinder and amalgamator, yielded \$75. The ore was from the Banner mine.

Same of 24th: The Star Company, in Washington township, is pushing ahead operations quite energetically and with favorable prospects. The yield of the last crushing, cleaned up a week or more ago, exceeded the expectations of the owners, and they are now working three shifts on the lower tunnel, and from unmistakable indications must be very close to the ledge.... We were shown yesterday a fine specimen from the Big Slide ledge, containing a mass of free gold, white, perhaps, fifty dollars, and fine-looking sulphurets.... James Ballard and others have lately run a tunnel to drain the Eclipse ledge at a considerable depth, and are now taking out rock from a shaft. We are informed that they have a ledge three feet in width, and that the rock is very rich in free gold.... We learn that a rich strike was recently made in the incline now being sunk on the Pennsylvania mine. The ledge is some twenty inches in width, and the rock very rich. The incline is now down about 180 feet.

From the *National* of October 20th: Bloomfield, about a mile from Nevada, is looking up wonderfully of late, owing to the unusual energy exhibited by the miners in opening up their gravel claims and getting them ready for winter work.... The Commercial mine is located near Eureka, on Poor Man's Creek. The ledge is now about three feet wide, and prospects well. So confident are the company of the richness of their ledge, that they are going to erect a 10-stamp mill, the timbers for which are now being got out.

Same of 22d says: Last Friday they discovered a rich streak in the Ophir, out of which about \$4,000 was taken in a short time.

From the *Union* of the 18th: On the "What Cheer," owned by Frank Carnana and Jamee Fowler, they have sunk a shaft forty feet, at which depth the ledge was struck, showing a thickness of a foot. The rock exhibited to us showed large quantities of free

gold and very rich sulphurets.... Two boxes of magnificent quartz specimens were yesterday taken from the New York Hill mine.

The *Transcript* says: From the 1st day of January, 1866, to the 8th day of October, 1866, 10,351 mines were recorded in the mining locations in the Recorder's office. The claims located average about one hundred feet each, making a total of 1,035,800 feet located in less than ten months.

The *Transcript* says: During the present season the miners on Rocky Bar, near Washington, have taken out large quantities of gold, and a large number of new gravel claims along the line of the channel have been located. We are informed that the entire channel from Washington to Canon Creek has been taken up, and several claims have been located below town. This channel is supposed to be the old bed of the Yuha river. It runs parallel with the river, and is about thirty feet below the present bed of the stream. Its course is straight, and it often crosses under the present channel and forms here, where rich deposits are found. Its width is from fifty to seventy-five feet, with bedrock of slate. This was undoubtedly at one time the bed of the Yuha, and it has been hurried by the filling up of the channel or from slides in the mountains. We were shown yesterday a handful of specimen, weighing from two and a-half to ten dollars apiece, which were taken from the channel at Rocky Bar. The gold is all coarse. This old channel will no doubt be opened all along the river, next season, and many fortunes will doubtless be taken out of it.

EXCELSIOR.—From the *Meadow Lake Sun* of Oct. 18th: The Cooper Company have sunk a shaft 35 feet in depth, and are getting out fine ore.... Returns from ten tons of third class ore from the Enterprise Co.'s mine, worked at Grass Valley, was \$280, or \$28 per ton. The ore was first roasted, and afterwards treated with superheated steam.... The Dead Broke Company, near the Enterprise, have a shaft down on their ledge forty-four feet. The lode at that depth is about five feet wide, and between the walls is filled with rich sulphurets.

From the *National*, Oct. 17th: From a chemical analysis by Prof. Price of San Francisco, the ore from the Young America mine is found to contain about 60 per cent. of cobalt and nickel and about 40 per cent. of other metals. According to the experiments made, the ore will yield, per ton, \$10 in gold, \$16 in silver, \$12 in arsenic, and about \$40 in cobalt and nickel. Prof. Price has offered, as agent of a Swansea Company, to advance \$40 per ton on all shipments.

Placer County—

From the *Stars and Stripes* Oct. 24th: At a depth of eighteen feet, the Martins Company, on the Rock Creek ledge, have developed a vein of extraordinary rich quartz eighteen inches in width, and showing free gold throughout.... The Congressional Reconstruction claim, owned by the same company who own the Civil Rights, have found some very rich quartz recently. They are now down some sixty feet on the vein, at which depth it is twenty inches wide and well defined.

From the *Placer Herald* of the 20th: The Julian ledge, located on Jenny Lind Flat, and owned by C. H. Schnabel, has recently been yielding remarkably well—from \$8 to \$10 per ton. Mr. S. is now attaching to his mill one of "Hawkins Grinders" for the purpose of saving sulphurets. He will have it in full operation next week. Mr. Schnabel has now reached a depth of 104 feet on his mine.

Plumas County—

From the *National*, Oct. 20th: Billy McKinnie, Dave Pearson and Louis Penfield, three of the oldest pioneers of Plumas, have found a new range of diggings in the Long Valley country, on Middle Feather, with coarse gold on the bed rock, and fine gold in the gravel.... Joh Richards and Ohas. White have bed rock in sight now, with a dollar to the pan, shoveled out of three feet of water.... Dick Marken & Co., on Saturday last, took out eight ounces, which is about an average day's work.

The Marysville *Appeal* of Oct. 23d says: We notice a large lot of heavy machinery going forward over the Oroville railroad to the Indian Valley Mining Company, Plumas county. On Sunday a couple of reels, weighing between four and five thousand pounds, went up to Oroville.

Sacramento County—

From the *Folsom Telegraph* of Oct. 20th: Several new companies have commenced work in the cement claims opposite this town, within the past week, with flattering evidences of success. The richest cement lies far below the low water line of the American river, and is believed to extend far into the basin of the high hills along the river, and for the distance of about two miles in length.

A number of sales of interests in the cement claims in Webber Hill, in the Western Tunnel and Spanish Companies, have taken place in town during the past week. The prices paid

have varied from one to two handfuls of twenties.

On the Jersey Blue claim the new mill is now in full and successful operation. A ditch four miles in length has been dug to bring a sufficient supply of water. There are two incline shafts on the ledge within two hundred feet of each other, each about one hundred and ninety feet in depth, and connected together at the bottom. The pay ledges in each incline is rapidly increasing in width, and now measures over eighteen inches. A thousand tons of pay rock is now in sight in the shafts, with four hundred tons of selected rock on the surface from which the mill is now crushing.

Shasta County—

From the *Courier*, Oct. 20th: After crushing twenty-five tons of rock from the Harrison lode, the Mammoth Company cleaned up \$669.58—or a little over \$26.50 per ton.... The Tornado Company made a second clean up last week, and realized \$250 for a run of two weeks. The gravel in this claim has become so hard that the owners have decided to drift and blast the bank down, instead of using hydraulic pipes, as they at first intended.... The workmen in the Big Central shaft, at South Fork, have tapped a vein of water, which filled the shaft to the depth of twenty feet in a short time. Two days' constant hailing failed to lower the water, and Peck has decided to run a tunnel from the side hill, in order to tap the shaft and give the water vent.... George McKean has just completed a furnace for roasting rock on Flet Creek. He has a rich ledge on that stream, and thinks he can reduce it to better advantage in the arena which he has lately erected.

Sierra County—

From the *Messenger* of October 20th: Preparations are being made to systematically open and develop the Page ledge, in Sailor Ravine, by a Grass Valley company, who have taken it in hand.... The lower adit of the Keystone is being rapidly driven ahead, the rock being soft and easily worked.... The Primrose cleaned up after a run of thirty days with one battery, crushing one hundred and twenty tons, the sum of \$3,600, making a yield of thirty dollars per ton.

On the eastern slope of the dividing ridge between the Yuha and Wolf Creek, a ledge was lately discovered by Mr. Wilson, and named the Alexander Von Humboldt. We were shown rich specimens of the croppings (spangled with gold) by Messrs. Lockwood and Clow, of Camptonville, who have been over to locate the claims, and came back through Downville to have them recorded. Extensions have been taken up for two miles. The ledge is about six feet wide.

Tulahoma County—

The *Citizen* of October 20th says: We were shown, one day this week, a piece of pure gold weighing two ounces and a half, which was taken from the Daly claim. This claim continues to pay handsomely.

From the *Sonora Herald*: The owners of the Rawhide claim are about to extend the facilities for its work. They are going to take out the five Wheeler pens in use, and substitute twenty. They are on a vein twelve feet wide, and down about two hundred feet. The mill will be in running order in about a month.

A specimen of retorted gold amalgam, weighing 175 ounces, the yield of two weeks' work by the Golden Rule Quartz mine, in Tulahoma county, was brought to our office yesterday. The mill crushes fifteen tons of rock daily, and the 175 ounces were obtained from about 165 tons.—*Alta*.

NEVADA.

Washoe—

From the *Enterprise*: The Daney mill has been leased by J. C. Caldwell, and will be run on ore from the Yellow Jacket mine. It is a 15 stamp mill run by steam power, and is considered a first-class mill of its size.... The Hale and Norcross mine gives the following monthly statement: During the month of September 3,130½ tons of ore were reduced, yielding \$150,719.49, which is 65 per cent. of the assay value.

Reese River—

From the *Reveille*, Oct. 12th: We saw today at the assay office the result of the first reduction of ore from the White Pine district. One ton of ore from the Enterprise ledge, worked at the Keystone mill, produced a bar of bullion of the value of \$111.52.... Specimens of the finest quality of ore, almost pure silver, obtained from the Silver Champion in the Philadelphia district, are regarded as marvels. One piece weighing fourteen pounds yielded an average assay of \$9.20 per pound; another chunk of thirty-one pounds, gave an average of \$4.84 per pound; while a third and small piece of 3½ ounces, is pure native chloride, without the least perceptible admixture of quartz—nothing in fact but silver and chlorine. Some 4,300 pounds of the ore have been brought in and are now being reduced at the Keystone mill.... Dr. Blatchly will spend the winter in New York, giving expositions of the

mineral resources of Nevada. He will carry with him a large and complete cabinet, containing specimens from every district.

From same of 13th: A good road is now being constructed between Austin and the southeastern portion of the State, where lie the rich mineral deposits of Danville, Hot Creek, and the wonderful Reveille districts. There is every probability that before the lapse of many months mills will be erected in all of these districts, and the transportation and travel thence will be of considerable importance. In Danville district, the prospect is very flattering. Six tons of ore from the Vanderbilt is now on the way to the Keystone mill.

Same of 15th: Capt. Pogo of the Keystone mill, has reduced the charges for reduction. The result has been that a large class of low grade ores, heretofore excluded, are brought to the mill, which is in consequence constantly running at profitable rates. Two additional reverberatory furnaces are being erected, which will be finished this week. On Saturday we were shown a batch of the ores from the Danville district, with certificates of their assay by J. R. Murphy. The Pontiacus No. 1, yielded \$73.16 and No. 2, from the case wall, \$180.64; Silveropolis, \$857.70; Vanderbilt, No. 1, \$884.39, and No. 2, \$570.01. The Pontiacus is fifteen feet wide, the Silveropolis is two and a half feet, and the Vanderbilt four feet wide.

From same of 17th: The ledges of the Chase & Dell Company, in Hot Creek district are the Potomac, the Richmond, and the Grand Marvel. Each location is 1,200 feet in length. The croppings are marvelously rich. A piece from the Potomac was assayed after removing all the visible horn and native silver; and the assay proved the rock worth \$1,521.38 per ton. Such productions are staggering to the belief, particularly when found in such great masses, in so many veins, and extending over so great an extent of country, yet so often are these results repeated, and from many tons which have been brought to the mills of this city for reduction, and producing from \$300 to \$800 per ton, one is forced to the conclusion, that in the vast, almost unexplored country to the southeast, are richer silver-bearing veins than ever before made known, even exceeding our fabulously rich Toiyabe. These ledges vary in width from four to twelve feet. The Potomac crops out like a great wall, and may be walked upon for a length of twelve hundred feet. The Grand Marvel is near the Potomac, and in many places, its croppings, eight feet in width, stand over six feet in height. It is thought to be an extension of the Silver Glance ledge. The Richmond crosses Rattlesnake Canon, and shows distinctly for the entire location of twelve hundred feet, and an average of eight feet in width. During last week 4,300 pounds of ore from the Silver Champion ledge in the Philadelphia district, were reduced at the Keystone mill, with the following extraordinary result: 4,300 pounds of ore yielded two bars of bullion 850 fine, and valued at \$1,541.43, being an average of \$716 per ton. Six bars of bullion, valued at \$5,000, were brought in yesterday from Col. Buel's mill in the Philadelphia district. It was the first lot melted in the district.

Same of 19th: Col. Robbins and Ed. Charbonno, left town to-day for Hot Creek, where they go to work the Indian Hunter and Mountain Eagle ledges belonging to their company. A ton of ore from the Northumberland, worked at the Keystone mill, yielded \$186.14; and four tons from the Lady Cummings, at the rate of \$130.13. One ton of ore from the Taylor & Pussmore, Cortez district, yielded \$263.50; and five and a half tons, from the Russell mine, belonging to D. T. Elmore, gave a bar of bullion valued at \$850, which is at the rate of \$145 45 per ton.

Humboldt. From the Register of Oct. 13th: In the Rochester mine, the workmen passed through a fine clay seam eight inches through, and were confident of having the ledge right at hand—as undoubtedly it was—but the water rushed in upon them in such a volume as to drive them from the work. They had sunk a shaft some 200 feet deep, and were drifting from the bottom to cross the ledge. This allowed no drainage, and they had nothing for it but to get out of the work. The tunnel filled, and the water rose 60 feet in the large double shaft in two hours. At last accounts it stood 75 feet in the shaft, and still slowly rising. This retards operations in the mine for the present, but yet is one of the best indications ever struck on the Montana ledge. The large clay seam is never found at that depth, except immediately against a ledge, and the living water indicates such a break in the country rock as is necessary to a true fissure vein. This flow of water will be a great advantage to the company, enabling it to erect its reduction machinery immediately at the mine. Some delay will occur to procure and erect a small engine to pump out the water.

J. S. Phillips, lately arrived, is now on the ground, with abundant means to prosecute work on the Napoleon series.

Pahranaagat.

A letter from Silver Cañon from Hon. Thomas Lane to the Gold Hill News says: A party of nine men leave here to-morrow to hunt for the famous Breylogle ledge, supposed to be in the vicinity of Death Valley. This makes the fifth expedition that has fitted out for the same purpose within the last three years. It is said to assay \$4,500 to the ton in gold; very little silver.

Raymond's five-stamp mill at Hico Springs is progressing finely, and will start in about 30 days. James M. Day, formerly of Gold Hill, is Superintendent. Business here is nearly at a stand; all waiting for the Pioneer Mill to start.

A letter to the *Fedette*, from the same place under the same date (Oct. 1st), says: Raymond has a ten-stamp mill at Call's Landing, which, with two others also there, will be in operation as soon as they can be transported to Pahranaagat and put up. There are now from 800 to 1,000 tons of ore out awaiting the arrival of the above named mills. Assays made from samples of large quantities of ore show it to be worth in some instances \$1,787 and \$1,554 and other great rates per ton. There are five companies from New York and one from San Francisco at work there, and everything appears bright for a rich return in the spring.

IDAHO.

From the *World*, Oct. 6th: The California Mining Company, lately organized, will soon commence active operations, and, we learn, with prospects of rich success. Their claims front on Moore's creek, about a half mile above town. East Hill tunnel is still progressing rapidly. It has now perforated the hill a distance of two hundred and fifty feet, which prospects well all along. We have run through the false bed-rock a distance of about two hundred feet, and are now meeting with rich views of gravel. Between these gravel views we find a blue cement from one pound of which we obtained nearly twenty cents. At Pioneer, a new water ditch is being constructed to the Toll-gate diggings, from Elk creek, by Messrs. Wilson and Watterman. The diggings prospect very richly. The miners about Pioneer are sinking for the lower bed rock, and rich strikes have been made. Very good pay has also been struck on Muddy. In Alturas county, very rich ore is being taken from the Ida Elmore. The mill will at once resume operations. Mr. Marx has made arrangements to have a good mill put up at the Boonaparte Mill Company ledge this fall. The mine yields rich rock. The Pittsburg Company, the Harris Company, and the Farnham Company, will each start their respective mills in operation next Monday, under cheering auspices. Times in the Yuba district are also rapidly improving. Claims pay well and ledges yield richly.

From the *Avant*, Oct. 13th: The five-stamp mill, of the Messrs. Black, in course of construction in Flint district, is expected to be ready to crush rock in three weeks. The Oro Fino and Morning Star Mining Company has bonded its interests in the Oro Fino and Morning Star mines to J. M. More for \$200,000, the time to expire June 1st, 1867. Mr. More is going East with full expectations of disposing of the property and paying all the indebtedness hanging over it, or raise the means to redeem and work it on his own account. In the vicinity of the Poorman a ledge was struck last week by George Vass and others, which tests high in silver and gold. Very fine gold is visible in considerable of the rock. The ore resembles that of the Empire. A great many men are sinking shafts and running cuts and tunnels on the south and west side of War Eagle. We noticed, on Thursday, a party of men driving a tunnel into War Eagle from near the head of Webfoot gulch. A party of miners are working night and day in a prospecting tunnel penetrating the mountain on the south side of Lung gulch, about one mile above Silver.

At Rocky Bar, Alturas county, Waddingham's mill will be running again in two weeks. The Idaho Company also purpose to go to work again. The old Cartee Company's mill will be set to crushing rock soon. Mr. Beeson also intends to start their mill immediately. The N. Y. & I. S. M. Co.'s mill is to be sold on the 15th inst., at sheriff's sale. The liens on it are about \$12,000. From Yuba we learn that DeFrees & Co. and M. C. Brown are getting their machinery ready as rapidly as possible.

W. F. Bryant, a practical assayer, who has spent the summer in Idaho, and examined carefully each district, says that for wood, water, and general facilities for the reduction of ores, Yuba stands ahead.

A rumor that the Wind River prospectors had been attacked by Indians, and eighty killed, has proved without foundation. At last accounts the parties of Patterson, Jeff. Standiffer and Capt. Bledsoe, about 700 strong in all, had united, and were making fair progress towards the head waters of the Big Horn.

MONTANA.

From the *Post*, Oct. 6th: Wessel & Wilkes' mill in New York gulch, cleaned up from a five days' run on twenty-four tons of ore from the Star of the West, \$1,400. Some Californians, who are familiarly known as the Harris boys, have been engaged in cutting a tunnel through the side of Bald Mountain. On the 28th ult., after having gone about seventy feet through gneiss, they struck a bed of gravel which appears to have been the bottom of some stream that may have flowed ages ago. One nugget, worth thirty-eight dollars, another valued at eleven dollars and several of less weight were found. Of course the news spread like a prairie fire, and within a brief time claims were staked in every possible direction. The place where it was struck seems to be a continuation of Alder creek and it begins where the old diggings ceased. On Oct. 2d, fifty-two wagons, in charge of Joseph Richards, arrived in Summit City with two quartz mills and machinery for Frank Christnot. They started from Nebraska City on June 15th. The new 20-stamp mill of the Excelsior Mining Company was started on the 5th Oct. The machinery worked to the entire satisfaction of all. Several ladies were present.

Letter from Helena: The miners in this gulch are, at least in the lower part of it, hard at work and taking out good pay, the abundance of water caused by the late rain giving their operations a new impetus. The quartz mills in our suburbs are working good ore with good results, but the gold is not fine enough to justify its passing at \$18 per ounce. Gaston & Simpson's mill, at New York gulch, is expected to make a big clean up within a day or two.

Confederate gulch is plying out for this year on account of scarcity of water, and numbers are leaving that locality on that account.

From Elk and Bear gulches, people are leaving en masse, on account of dull times and fear of winter.

"Red Rock City" is the name of a new mining town which has sprung up within the past few weeks. It is situated near the head of Highland gulch.

Letter from Pipestone: The latest stampede is to "Homestead gulch," a branch of the Big Pipestone creek. It is some seven miles in length, and has a good sluice head of water. The depth to the bed-rock averages about five feet. Prospects are obtained from the grass-roots down, varying from a half cent near the surface, to five cents on the bed-rock. An immense lode has been lately discovered near this place which goes ahead of anything yet discovered, of which we have heard. It is over two hundred feet in width, and has been opened for a distance of five miles. The wall rock has been found on both sides of this lode. The lode itself looks well, having hundreds of cords of rock on the surface. The quartz mill of McKinstry & Co., is making some good runs from the Clipper lode.

Bannack letter: Mr. Esler is sinking on the Legal Tender lode, and is down over one hundred feet. The ore is a galena, and the average assay in silver is \$500 to the ton. Mr. Esler has a contract with the St. Louis Montana Mining Company to smelt 200 tons of the ore, which is now being worked at the rate of fifteen tons per day. The ore is all ready, and over 100 tons at the furnace. The shaft on the Stapleton lode is now down thirty feet, and the vein five feet in width. There will be a great mining camp on Salmon river. The diggings are on Napie's creek. Smith & Greater and Captain Wall are doing well. They took out over \$1,300 last week in Dry gulch, a half mile west of Bannack, and their ground is improving. Prof. Eaton is about ready to start his furnace. Clark & Kirby have their mill inclosed, and are driving business before them.

From the Helena *Radiator*, Oct. 6th: The large ditch, on which two hundred men have been employed for the last four months, will be completed in one week from this time. It is calculated to carry 1,500 inches of water.

Wagon after wagon departs from our midst daily, loaded with passengers for the Eastern States, via the Missouri river. We expect a large number of these departing ones, long ere this time next year, will have changed their mind relative to the States being the best place for the working man.

COLORADO.

From the *Journal*, Oct. 2d: D. W. Stevens is going to fit up and run the Holbrook mill. Ed. Moores is now running it for the Smith & Parmelee Company. At first he crushed from a lode he leased, using five or six cords a week, and taking out \$900. It is an 8-stamp water mill. The wheel is to be housed in, and a large stove put in, so that it can be run during the cold weather. N. F. Spicer, agent of the Red Mountain Broadway Mining Association, came in Tuesday evening with about 1,000 pounds of good looking ore, one piece of solid iron and copper pyrites weighing 142 pounds. Mr. Spicer is fully satisfied that the most extravagant expectations from the Red Mountain mines will be fully realized in the

end. He is going to Chicago the coming winter, and anticipates no trouble whatever in getting capital to build a Keith mill. Mr. Fitzpatrick shipped this morning 118 ounces of gold, taken from 11 cords of second-class ore.

From the *Register*: John Shumer called yesterday with a sack filled with gold, weight 96 ounces, taken from seven cords of surface quartz, Adeline Lode, Central Mining District. The Adeline is presumed to be the same vein as that known as the Corydon mine. Messrs. Shumer and Hines are the owners of the discovery claim and No. 5 east, located and recorded early in '59. They are now developing No. 5, have a shaft 45 feet deep and a crevice of pay-rock ranging from two and a half to three feet in width. The ore can be extracted and laid on the surface for twenty dollars per cord.

The *Journal*, commenting upon the above, says: The good results of a depression of sales of mining property in the East are just now becoming apparent. For three years past property like that mentioned by the *Register* has laid unworked, merely because its owners were looking to "a sale in the East" rather than to the working of their property for a fortune.

ARIZONA.

The *Alta* copies a private letter from Prescott, Sept. 25th, from which we clip this item: The mill known as the Vickroy Mill, situated in Turkey Creek District, is being pushed forward by Mr. Coffin. He has a large number of men at work, and is getting along finely, and will be ready to run in about two months. Everything looks prosperous here; wages high and men scarce. The gold quartz mills that are running are doing well.

CEMENT MINING—IMPORTANT SUGGESTIONS.

A correspondent of the *Alta* sends to that paper the following suggestions with regard to cement mining, which it may be well for our miners to take into consideration:

How to mine blue cement gravel is a question that may bring profit from discussion. No one can look at the great difficulty of picking among cemented boulders of quartz, without exclaiming: "That cannot be the best way." When we find a material easier than quartz, alongside, we prefer sinking our incline or running our drift on it, rather than in the quartz. The slate which forms the bedrock of the blue cement gravel is much easier to cut by an undermining, and we suggest its preference.

A very simple machine is now extensively used in England for cutting coal in the vein. It goes by hand. But at the Cambria Iron Works, Johnstown, Pennsylvania, the coal is mined by such machinery, worked by compressed air.

At most of the cement gold mines, there is great fall of ditch water to compress the air, and this system can be readily introduced.

The ordinary stamps appear also inappropriate to the milling of boulder cement. What is wanted is not to crush the boulders, but to get rid of them. It is the cement we aim to detach from its attachment. It seems as if this could be better done by some such skinning movement as the revolving harrow or the rocking cradle.

Now that it is found that the hydraulic gravel of our placers exists under the entire length of adjacent mountains, it becomes important to devise the best method of working this interesting form of gold mines, for this new source of auriferous gravel seems about to rival quartz mining in its production.

COAL BEDS ON SNAKE RIVER.—A correspondent writing to the *Oregonian* at Farewell Bend, says: "I visited the coal bank of Messrs. Packwood & Co., at a point three miles south of this place, and was much surprised to find so good a vein of coal as they have there. The croppings were originally found near the water's edge, and are discernible for a distance of about one half mile above and below the tunnel.

"The enterprising proprietors have run a tunnel a distance of 260 feet into the mountain, and timbered it with eight-inch square timbers four and a half by seven feet, and have erected a powerful pump, of the Hansbrow patent, which will enable them to keep their works dry. The thickness of the veins of coal, together with the interlying strata of clay, is about fifteen feet from hanging wall to foot wall, the coal veins comprising about eight feet of the distance, and consisting of veins of from one to three feet in thickness. The coal has been pronounced by numerous parties who have tried it as an excellent quality of bituminous coal, suitable for all purposes of blacksmith work, and also excellent for generating steam."

The different varieties of coffee lose in the operation of roasting from fifteen to twenty-five per cent. in weight, and gain from thirty to forty per cent. in bulk.

Mining and Scientific Press.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the Mining and Scientific Press in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. O. P. Truesdell will act as our Corresponding Agent and Solicitor, in the Interior of this State, from this date. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

San Francisco:

Saturday Morning, Oct. 27, 1866.

NOTICES TO CORRESPONDENTS.

Owing to the large amount of correspondence received relating to interesting points connected with Mining, Metallurgy, Mechanics, etc., we are compelled, for want of time and space, to reply briefly in the following form to a portion of such queries as are of general interest.

AERIAL NAVIGATION.—We do not feel surprised at the inquiry made by "X," whether the announcement made by a daily contemporary is a hoax? In reply to this, we may state that from inquiries made on this subject we are justified in stating that the parties, consisting of the proprietor of the weekly journal alluded to, together with his associates, are in sober earnest on the subject matter, so much so that it is not improbable that we may in San Francisco, on or about the New Year, have the opportunity of witnessing the first trial. From this information we have obtained, we are disposed to think that the probabilities are favorable to a successful issue to the enterprise; though we do not expect, like the projectors, that one hundred miles per hour (hurricane speed) can ever be generally practicable. If the experimental trip, on a calm day, attains one-tenth of that speed; and if in twelve months thereafter double that rate is attained, we should deem such results as most decided instances of success. The projectors have certainly been fortunate in selecting for their machinist, constructor and superintendent, a gentleman peculiarly well qualified for the purpose, who, we feel certain, that so far as in him lies, will exhaust every available means known to mechanism to render the trial machine perfect. The power employed will be steam, the boilers being of an improved construction. Should some of the attempts be successful, to which allusion was made in our last number, for attaining power through the medium of electricity, it appears to us that aerial navigation is a field to which it, perhaps, could be most successfully applied. The full merits of the enterprise can only be determined by actual experiment.

A LEARNER—NEVADA.—Wherever the circumstances connected with a mineral vein are such as to prevent the possibility, or on economical grounds render it inexpedient to open out the same by any other means than by shafts, it will in all extensive works be found most advisable to effect this end by perpendicular shafts, by which means both hoisting, and especially pumping arrangements, are greatly facilitated. The greater the depth penetrated, the more decided do the advantages of this method become apparent. On veins having a low inclination, or less than forty-five degrees, it will generally be found advantageous to sink at least two shafts on a claim extending continuously for twelve to fifteen hundred feet. Such perpendicular shafts ought to usually intersect the vein at about five hundred feet below the surface at the angle named; when the angle is as high as from 60° to 70°, it will often be found most economical to make the intersection at a depth of one thousand to twelve hundred feet. Sinking shafts on the incline can only be judicious in cases where the angle is very low, or as is frequently the case, where it may be desirable that a test should be made of the general character of the vein prior to deciding upon the expediency, or otherwise of ultimately making a larger outlay in permanent construction.

PETROLIA.—We are glad to perceive that the efforts being made by the Buena Vista Petroleum company are likely to result in our obtaining a home supply of lubricating and illuminating fluids. A short time ago we expressed our regret that this domestic source of wealth had been, as we conceive, somewhat too hastily neglected or laid aside; for it is a business that will some day become important.

A splendid gold watch and chain were presented to Mr. Joseph G. Perkins, foreman of the Pacific Iron Works, a few days since, by the employees of that establishment. Mr. P. goes on a visit to the Atlantic States.

THE NEW GOLD WORKING PROCESS IN MARIPOSA.

Under the above head a correspondent in another column of this present issue, furnishes some particulars with regard to the modifications lately introduced into the milling operations on the Pine Tree vein, on the Fremont Estate in Mariposa county. When the results of the experiments recently undertaken there were first made known, we were inclined to receive the reports, as our correspondent remarks, "with many grains of allowance." The imperfect manner in which the process was explained, taken in connection with the past history of that property, naturally led us to such a conclusion. In subsequent inquiries, however, resulting in the united testimony of a large number of witnesses and persons having knowledge of the late operations at that mine, all tending to confirm the truthfulness of these reports, together with a further and full description of the new process employed, and the particulars of a series of elaborate experiments made in New York with a portion of the same machinery, have led us to accept the reports in question, with at least the usual degree of credence given to ordinarily well authenticated mining reports. That the increased yield claimed is actually obtained, we think there can be no further doubt; but in the absence of carefully conducted comparative experiments, we are not altogether certain that a portion of the increase may not be due to a better quality of rock than that heretofore obtained. An increase from ten to thirty dollars per ton, which is about the figures claimed, is a very large percentage of increase to be derived from improved machinery alone.

We are quite ready, however, to admit the extreme probability of a very large improvement, from the fact that the very ends are accomplished in this process, which we have for years held to be essential to the proper working of auriferous rock, viz., a reduction to an impalpable powder and careful amalgamation in close vessels, from which there can be no escape of water until the amalgamation and separation is complete. If these ends are accomplished to the extent described (and we have no reason to doubt the representation), it is more than has yet been practically accomplished by any other class of machinery ever put up for working quartz rock.

By this process the quartz is first subjected to a crushing operation by being passed between Cornish rollers, or through Blake's or any other similar crushers; it is then placed in one of Landgren's pulverizers, which consists simply of an iron cylinder, similar in its working to the Freiberg barrel, and from thence passes through Ryerson's superheated steam apparatus, all substantially as described by our correspondent. The great secret of success in the operation, if we are correctly informed, must be in the extreme fineness to which the rock is reduced. By this machine it is claimed that quartz may be so finely pulverized that it is impossible to distinguish by the sense of touch the powdered rock from the finest flour. The principle on which this is accomplished, and which is not at first sight apparent, is the acquirement of an extensive grinding surface, entirely unattainable in any other practical manner. In one of these machines of the ordinary size, the amount of grinding surface is nearly or quite 800 superficial feet, and much of it working under the great pressure due to a superincumbent mass of 3,600 pounds. When the machine is running at its proper speed—about 24 revolutions per minute, containing 2,400 pounds of ounce bullets—every one of the little balls is kept in constant motion. The effect of this action is apparent in the result produced. A charge of 1,200 pounds of rock, just sufficient in amount to fill the interstices between the bullets, previously reduced to the average size of wheat grains in the crusher, by one hour's action of this machine is made as fine as flour; in two or three hours it becomes a flocculent mass, which, on exposure to the atmosphere, will float away like the most impalpable dust; at least so we are informed by one who has

experimented long and patiently with the machine in New York. The harder and more brittle the rock, the quicker and finer it is pulverized. Quartz is more readily pulverized to this degree of fineness than charcoal or any other substance of a spongy nature. The wear upon one of these machines, when properly worked, contrary to what one would suppose, is very light—merely nominal. The balls will last for years, and can be procured very cheaply, at a price but little beyond the cost of ordinary castings. The barrel will last four or five times as long as when used in the Freiberg process. By a careful perusal of this article, and the communication of our correspondent upon the same matter, it will be perceived that the process employed to bring about the above results is a very different one from that which has hitherto been known as the "Ryerson process," which we at first supposed it to be. Even the Ryerson amalgamator itself is operated differently from the manner employed by the inventor in his various trials for two or three years past.

It is manifest to every one that in such extraordinary fine grinding as is obtained by Landgren's pulverizer, every particle of gold must be liberated from the quartz; and all that is then required is a speedy and sure mode of securing it. We have no doubt but that the Ryerson amalgamator and separator, as operated, will accomplish that end. Pans and other amalgamators may do it equally well, and perhaps at less expense.

So far as hearsay evidence can be relied upon, and so far as evidence can be deduced from theoretical reasoning, our present impression is, that an important advance is about to be made in working auriferous quartz by the introduction of Landgren's pulverizer. The works at the Pine Tree mine are now idle for want of water, but they will soon be in operation again, when we hope to lay before our readers such information as will definitely settle the question of the value of this machine for working quartz. A most unusual degree of interest seems to have been elicited in this matter, and we shall lose no opportunity to place all the facts in relation to it before our readers at the earliest practicable moment.

RICH BOULDER SPECIMENS.—Our attention was recently called to three quartz boulder specimens at the office of Mr. B. W. Mudge, No. 528 Clay street. The smallest, about the size of a hen's egg, we should judge to contain one-half its weight in pure gold. The largest piece was the remnant of a good sized boulder, which yielded 22 ounces of gold by hand-mortar process.

These specimens are from the blue gravel channel in the New Jersey claims, owned by Mr. G. W. Reamer, at Forest Hill, Placer county. As a representative of gravel and cement mining, we understand this mine to be one of the best in the State. It embraces over 2,800 feet of tunnels. Its location is next to the Jenny Lind claims, also notable for extensive and rich gold deposits. The specimens alluded to came from what has been termed the "back channel," which proves to be an extension of the original or front lead. The front deposit is a red gravel, while the rear ground, but recently discovered, turns out the true blue gravel. Mr. Reamer informs us that there will in all probability be eleven cement mills in operation within a circuit of three miles about Forest Hill by the first of January next, against one in operation a year ago. All that are yet running are meeting with good success.

AN ACCIDENT of a somewhat singular character occurred in the claims of the Rocky Bar Company, near Washington, Nevada county, a few days since. The timbers in the tunnel took fire, and burned so furiously that the workmen made their escape with difficulty. After about thirteen hours the fire was subdued by deluging the claims with water.

THE SILK FACTORY of Neumann & Myers is to be at San Jose. Certain parties have given them twenty-five acres of land for the purpose. They will, therefore, be in the immediate neighborhood of Mr. Provost, who grows the material for their fabrics.

A RIVER OF HEAT.

Captain Mullan, in his "Traveler's Guide to Oregon," etc., speaks of a most remarkable meteorological phenomena, which he has observed in his travels through the country between the Rocky Mountains and the Black Hills of Nebraska. He calls it an "atmospheric river of heat." This river of heat, he says, appears to have its origin somewhere to the southwest of the Black Hills in Nebraska, and moves thence in a northwesterly direction, crossing the Platte not far from the old emigrant crossing, now the Platte Bridge, courses along the northeastern slope of the Wind River Mountains, over the principal gold regions of Montana, between the Oro Fino and Selmon river mines of Idaho, and strikes the eastern line of Washington Territory north of Salmon river. At this point it spreads out, fan-shaped, and is lost over the great plains at the headwaters of the Columbia river, which forms the chief part of the western portion of Washington Territory. On either side of the main current are walls of cold air, which are so clearly perceptible that the traveler may always detect them as soon as he enters the chilling atmosphere.

This extraordinary current of heat warms up the entire eastern slope of the Cascade range of mountains north of the Columbia river. The phenomenon is pronounced to be as useful as curious in pointing out a natural course of travel and settlement. Passing, as it does, over a region suitable for a permanent population, it locates upon the map a line of future settlements from Fort Laramie, in a northwesterly direction to the headwaters of the Columbia. By its action the temperature of all the eastern and northeastern portions of Washington Territory and northern Idaho, which consists mainly of an open grazing country, is raised to about the temperature of Philadelphia, although located from seven to eight degrees farther north. Whatever may be the cause of this remarkable phenomenon, the fact doubtless exists, and must for all time enter as an important element in the economical development of that region of country, a territory embracing from thirty to thirty-five thousand square miles. When it is remembered what marvellous results and conclusions have been arrived at, and what important deductions have been made from the study of isothermal laws, which are here so especially and distinctly marked, we may, with much confidence, predict that the day is not far distant when this region will teem with an industrious and thriving population. It is directly in the track of the proposed line of the Northern Continental Railroad, which will soon become almost as much of a necessity as the central road has already become. It is even now, indeed, but a short distance removed from the head of navigation on the Yellowstone river. Any one who will carefully study the geography, climatology and agricultural and mineral resources of this region, cannot fail to be convinced that it will ere long become a most important portion of our Pacific domain.

PROFESSOR MORSE was at Dusseldorf when the news of the successful laying of the Atlantic Cable reached that place on the 28th of July. Some thirty-five of the principal merchants in the city were at the moment celebrating their annual dinner in the hotel where the Professor lodged. The chairman went out and brought him into the room. He was received with three hearty cheers. Each man filled his champagne glass, and stepping forward, touched it to that of the Professor, whose health was drunk standing. He briefly replied in English, and retired amid cheers.

TIN ORE IN MAINE.—A large deposit of tin has been, according to the *U. S. Mining Journal*, discovered in the State of Maine, near the town of Paris. Assays have been made at Yale and Amherst Colleges, said to show a yield of 78 per cent. The character of the ore is crystallized oxyd of tin. A specimen now in the cabinet of Amherst College weighs over five pounds, and is said to be the largest crystal of tin ever found.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, the most important and valuable new and important inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

RECENT INVENTIONS.

NEW PAN.—The Nevada Gazette says that a new grinding and amalgamating pan, invented by H. A. Gaston, late of Austin, Nevada State, was put in operation on the 12th instant, at Stile's quartz mill at that place. In some respects, says the Gazette, it differs from any pans now in use, the grinding machinery somewhat resembling the screw of a propeller, and when operating currents are created which keep the pulp continually in motion, and bringing the coarser particles under the millers. That paper expresses the opinion that it will be found an excellent pan, both for grinding and amalgamating. It will be thoroughly tested at Stile's mill.

PATENT CAR TRUCK.—The Sacramento Union has seen the model of a new car truck, invented by D. W. M. Lower, of that city, and says: "The object of the inventor is to get up a truck which will obviate the well known difficulties attendant upon the ordinary truck in turning curves. The inventor claims an independent wheel which obviates the sliding process of the fixed wheel—a flat surface on the face of the wheel which prevents extra wear of the track—the adjustable arch wheel which prevents extra wear of the truck—the adjustable arch bars which conform to the curve of the track—easy and effectual process of oiling, and boxes which, when worn out, may be replaced without throwing away the wheel. In all these respects the truck appears to work well and to be well adapted to the object aimed at. Lower has been a resident of Sacramento during the past two years, and has been employed the greater portion of that time at the workshops of the Pacific Railroad Company on Sixth street. He has taken the preliminary steps to secure a patent for his new invention. If it stands the test of practical work it must come into general use."

NEW ELEVATOR.—A COLORADO INVENTION.—The Colorado Journal of Oct. 2d, describes as follows a newly invented elevator for use in the mines. While in Denver we saw an elevator so cheap and simple, and yet so effective and convenient, as to excite wonder that it had not long ago been thought out and applied. It is a square bucket hung in a frame, running in a way, guided by little wheels at the sides, and the way bending outward above the mouth of the shaft so that the bucket by means of the wheels empties itself into a spout and resumes its wonted position on the reversal of the motion with as much grace as a gentleman tips a glass or kisses a lady's hand. It is perfection itself, can be put up for little or nothing, and is such a beauty as no working shaft should be without. It is the invention of a miner named George Williams. He made a model perhaps eighteen months ago in the South Park, took it to Denver and bored people with it for months before he could get any notice taken of it. At last Mr. A. J. Williams took a thousand dollar interest in it, and George went on and got out his patent. He immediately went into the coal mines of the East with it, and as soon as it could be introduced the demand became such that he writes out that Colorado and the far West must wait. The miners of the East are intensely chagrined, however, that a Colorado man to teach them how to mine, how to elevate and empty ores. The prospect is that the elevator will be adopted throughout the mines of the world just as quickly as it can be done, and that George Williams will make a handsome fortune out of his invention. As yet he has made no effort to introduce it in Colorado, and A. J. Williams having just gone on East, we suppose George has no agent in the Territory.

PATENTS RECENTLY ISSUED.

ANIMAL TRAP.—David N. Phelps, San Leandro, Cal.: I claim a trap constructed of wire or iron, A, with main spring, B, semi-circle, C, parallel straight arm, D, with bent head, F, E, said arm crossing the semi-circle and forming the hold when sprung, when set held in place by the bent arm, H, and sprung by bait H', substantially as described and for the purposes set forth.

ROTARY VALVE.—Daniel Sexton, San Gabriel, Cal.: I claim the arrangements of the ports, c, e', port, d, valve, B, baving partition, E, stem, C, lever, D, temper-screw, G, ports, e, e', ports, f, f', and cylinder, A, constructed and operating substantially as and for the purpose represented and described.

RIFLE BOX.—Rhesa H. Dunning, North San Juan, Cal.: I claim the rifle box, C, damwall, D, or their equivalents, to be employed for saving gold at any point where there is a divide of waters, substantially as described.

TAPPET FOR STAMPS TO QUARTZ MILLS.—E. P. McCarthy, San Francisco, Cal.: I claim the

use of a rubber tappet, A, steel shod, the steel shoe, B, plate, E, and bolts, F F, combined in the manner and for the purposes set forth.

CANDLESTICK.—Alfred Rix, San Francisco, Cal.: I claim, 1st, The use of the jaws, B, B, one or both movable, or their equivalents, arranged with a space, z, on each side of the candle by which the candle can be adjusted vertically by the thumb and finger. 2d, The trapezoid, n, b, c, d, by which to operate the jaws, all constructed substantially in the manner and for the purposes set forth.

DESULPHURIZING ORE.—John A. Hitchings, Denver City, Colorado: First, I claim the arrangement of the crucible with its dome-covering sectional lid and discharge openings, M P, substantially as and for the purpose described. Second, I claim the combination with the crucible of the water supply tank, K, as and for the purpose described.

PATENTS can be obtained for citizens on this Coast through the Mining and Scientific Press Patent Agency, in one half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars Free.

DEWEY & CO.,
Patent Agents, 505 Clay street, San Francisco.

MINERS' INCOMES AGAIN.—The largest individual income derived from the working result of mining for the year 1865, in California, was that of Mr. James B. Pierce, of San Francisco. It came from the Blue Gravel claims near Smartsville, Yuba county, and amounted to \$102,031. Jules Fricot, a Nevada quartz miner, was assessed \$182,511, but we are recently informed that the larger part of his assessment came from the sale of mining ground.

SUCCESSFUL NAVIGATION OF THE COLORADO. The safe arrival of the steamer Esmeralda at Collville, the head of Colorado river navigation, is announced. This settles the question of the feasibility of the river route to Salt Lake and Pahranaagat. The extraordinarily rich new districts in southeastern Nevada, will probably be furnished with their machinery by this route. Captain Rodgers, master of the boat, declares that at the present stage of water "he could take up a steamer drawing six feet of water."

FIRST SHIPMENT.—A lot of several tons of quartz from the Fox Copper ledge, arrived in this city the past week, and was sold for shipment to Swansea. We understand from Mr. Thorp that the work of development at this mine is going on steadily, though slow, with good indications of ultimate success.

THE DEEPEST COAL MINE IN THE WORLD, that of Montwearmouth, England, 1,900 feet from the surface, was visited by some members of the British Association. Four ladies were of the party. The workings extend to a distance of two miles from the shaft. The heat at the bottom is from 80° to 90° F.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

CONNECTICUT

Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS.....\$12,000,000.

THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,
The Largest Amount Insured,
The Largest Surplus,
The Largest Business,
The Largest Income.

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT. of the premiums paid during the year ending 31st of January, 1865.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies to which Life Insurance is applicable, among which forms are—

Whole Life Policies, by a continued annual life premium.

Whole Life Policies, by TEN annual premiums.

Endowment Policies, by a continued annual premium.

Endowment Policies, by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give a note in part payment of the premium, but may, if preferred, pay the first four premiums in cash, after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums ONE HALF. When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be applied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

Accidental Insurance!

The Accidental Insurance Company OF NEW YORK.

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident.

In case death does not result from the injury, the insured receives a weekly compensation, as long as he is disabled (not to exceed twenty-six weeks).

ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in lengths of the Annual rate, as follows:

1 month, 2-10.	4 months, 5-10.
2 " 3-10.	5 " 6-10.
3 " 4-10.	6 " 7-10.

[Written for the Mining and Scientific Press.]

From Tuolumne County.

EDITORS PRESS:—I find Tuolumne county very different from what it was in my mining days. Some towns are worn out and lifeless, the people almost dispirited and ready to migrate. Quartz is now their great hope, and it is not without good grounds. I think this the richest quartz county in the State; but the lack of capital is the great drawback. This is beginning to be changed. Capitalists are turning their attention this way, and meeting with good rewards. Since my arrival here I have visited many of the quartz mines and seen some rich specimens and piles of ore. At Chile Hill the

GOLDEN RULE COMPANY

Are pounding away with very good rock, and doing well. They have a good vein, and are working it economically. My next call was at

HESLER'S MILL,

Quartz mountain. Here I found a mill running, but it was on surface rock, as in their shaft the vein had left them, and they were sinking with the intention of drifting for the vein at a greater depth. Their surface rock pays them a small profit, so that they can develop their mine without a heavy expenditure out of pocket. Down the creek from here is

APP'S MILL,

Running on good ore and keeping constantly at work.

But the greatest expectations here now are based upon Whisky Hill, a large portion of which has been purchased by the

TRIO COMPANY.

General Rosecrans, as the superintendent, has already started three exploring shafts and a tunnel, and is pushing work forward rapidly, and I have no doubt the company will be amply rewarded for their expenditures. I have no reliable data upon which to estimate the amount paid for these mines, therefore it will be useless to attempt to give you the figures.

AT RAWHIDE RANCH MINE,

Just across Table Mountain from Jamestown, the mill is at present stopped for extensive alterations. They are putting in six more Wheeler pans, making eight in all. This is the finest mill of the size I have seen in the State, and it seems as if no expense had been spared to make it complete. At the mine they are taking out very rich rock and are going down still deeper. They are about putting up a 40-horse power engine for hoisting purposes. Their new shaft is down about fifty feet, and the prospect is that they will get as good rock here as in the old one.

SONORA

Presents a strong contrast with the towns about it, looking about as well now as I have ever seen it, and giving evidence of its prosperity in the fact that there are very few places marked "To Let." While there I visited the

SONORA FOUNDRY,

Phelps, Cowie & Shepherd, proprietors, and found it quite an extensive establishment, consisting of a foundry and machine shop, and judging from specimens of work in the shop, they are capable of building first class machinery. A. B.

Jamestown, October 16, 1866.

WITH PALMER'S PATENT STEAM CHEST,

Superior for working either Gold or Silver Ores.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-1f

With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.]

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay Rags, Screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

ROLLERS.—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Rectorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

BREVITIES.

MOUNT HOOD is smoking.

On the night of October 14th, ice half an inch thick formed in Colfax.

The yield of wine in Amador county will be double that of any former year.

The San Lorenzo paper mill made 15,927 reams of wrapping paper and 253,254 pounds of printing paper the past year.

The amount of wine produced in the foothills of El Dorado, Placer and Sacramento counties, will exceed in quantity that of last season nearly, if not quite, two-thirds.—*Folsom Telegraph*.

The Union Pacific Railroad progresses westward steadily at the rate of a mile and three-quarters a day. Once General Cheeseman, Superintendent of the road, made a wager of \$10,000 that he would lay three miles in a day, and did it.

THOMAS B. LEWIS, Esq., the delegate lately chosen by the citizens of Idaho, is now on his way to Washington City, to lay before the Executive the facts relating to the Indian troubles in the mining districts, which seriously interfere with the progress of that Territory.

The *Sonora Herald*, of October 13th, says: Some parties have discovered a plumbago mine near the city, on the French garden road, and are ready to work on the same. An advance of \$40 per ton has been offered in San Francisco for what is got out. The company contemplates sinking a shaft forty feet deep.

The U. S. Circuit Court Judges disagreed in regard to the question whether the provision of the statute under which gold incomes are converted into their market value in currency, and taxed at the amount in currency, is constitutional. An appeal has been taken to the Supreme Court.

FRZ-GINNON's asphaltum pavement, laid down twenty months ago between the rails on California street, between Montgomery and Kearny, has worn well. Having, however, become smooth, it does not furnish a secure footing for horses, the inclination being at that point considerable. It is therefore to be "picked" up, broken into fragments, and relaid in ridges.

A NEW life-saving apparatus was recently tested near Boston, under the direction of Captain Forbes, of the U. S. Navy. He placed his mortar at Deer Island in position, and at the signal it was discharged, the hollow shell flying across a vessel's amidships, and leaving the line in the rigging. It was quickly secured, and in a few minutes a larger line was drawn in, made fast, and the communication with the shore was secured.

The piano-violin, which is to be exhibited next year at Paris, is in shape like an ordinary piano-forte, with an extra box. The player performs as usual, and no sooner do his fingers touch the keys than the violin is heard in unison with the piano-forte. Inside the box is a violin, and four large bows run across the strings and compel them to sound the notes. The bows move up and down perpendicularly, each in its turn, and sound each note, which is made by the touches of the piano-forte. It is an American invention.

Rheumatism!!

ANOTHER WITNESS!

SALMON FALLS, June 17, 1885.
H. BOWMAN—DEAR SIR: HAVING HAD A FAIR test of the virtues of RICHARDS' REMEDY FOR RHEUMATISM, I take great pleasure in stating that its effects with me have been even better than its recommendations claim. In 1883 I first heard of the Medicine. I had then been for three years severely afflicted with Rheumatism, and having tried everything I could hear of, without any permanent benefit, I concluded to try this.

On taking the medicine in three days I experienced great relief, and in one week was entirely free from pain, and had completely recovered. I have since used it, which had become almost powerless, so much so that I could not dress myself without assistance. Since that time I have been free from Rheumatism. I have recommended RICHARDS' REMEDY to numerous friends, and in every case it has proved successful. I therefore take great pleasure in recommending it to all who are afflicted with Rheumatism, and especially to all mercurial chronic Rheumatism cases.

Yours respectfully,

(Signed) ERASTUS PARSONS,
President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by

H. BOWMAN,
Druggist, Sacramento.

Price, \$2.50 per Bottle.

Important to Californians.—Many inventors have lately been claiming for Patent, and some have been granted, patents for the unqualified agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requirements of the Department, and properly filed all necessary papers as Claim Agents.

REMINGTON'S ARMORY.

Agency, 310 Washington st., San Francisco.

PRICES REDUCED!

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Belt and Pocket, Double and Single Action, Repeaters, and Vest-pocket Pistols, with copper ammunition; Police Revolvers, a new model, navy size ball, 4 to 6 inch barrel. Rifle Cases—an entirely new Arm—having a range and accuracy equal to a rifle, and a most perfect Gane. All the new models for sale very low.

121131st ALBERT E. CRANE.

Pacific Law and Collection Office

W. H. ALLEN,

Attorney and Counsellor at Law,

Principal Office at Rooms 11, 12 and 13 Amory Hall Building,

502 Montgomery Street, San Francisco, Cal.

Agencies at every City and Town on the Pacific Coast.

RADICAL CURE

RUPTURE!

Treatment of all Deformities of the Body, by DR. A. FOLLEAU'S process. 624 Washington street, up stairs, Washington Baths Building, between Montgomery and Kearny streets.

DR. A. FOLLEAU

Has his studies and manufactures in the same building. Every kind of Apparatus, Trusses, Orthopedic Instruments, Artificial Limbs, etc., are manufactured and applied by himself.

He has no connection with any Agency.

8113-1411p

BROWN & BEADLE,

Offer their services to

INVENTORS AND THEIR ASSIGNEES,

PATENT SOLICITORS.

They will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to them for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as Attorneys in presenting Applications at the Patent Office, and in managing them in a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D. C.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test 1. Ore sent to this establishment, either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process at hand—Sulphurets, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MORPHY.

Our Patent Agency.
 The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS
 has been signalized with remarkable success during the
 past two years. The Importance to the inventive genius of this
 coast of a thorough and reliable agency for the solicitation
 of LETTERS PATENT from the United States and foreign
 Governments cannot be over-rated, and the Proprietors of the
 Press, feeling the responsibility which rests upon them, and
 the reward which must follow the faithful performance of
 their trusts, will take care to afford inventors every advan-
 tage to be secured to them through a competent and re-
 sponsible agency upon this coast.

Illegal Supplemental Advertising.—It would be well for Mining Companies, whose advertise-

ally papers, to inquire into the legality of that class of
advertising.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Frame; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective millers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the miller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been bruised. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by **KNAPP & GRANT,** 310 Washington street, San Francisco, who are desirous to use water-power can be supplied. These wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in mill-race inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to **KNAPP & GRANT,** San Francisco.

Leffel's Lever Jacks.

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by **KNAPP & GRANT,** San Francisco.

To Ditchmen, Millmen and Others Requiring **IRON PIPE.**

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of **IRON PIPE** of every description. He also has on hand a deep well **FORCE PUMP** of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground.

STODDARD'S CELEBRATED WATER FILTERS!

PURIFY RAIN, RIVER, OR SPRING VALLEY WATER perfectly pure and healthy. Three sizes. Price, \$12, \$15 and \$18. For sale by **S. B. STODDARD,** Corner of Battery and Pacific streets, San Francisco.

SAN FRANCISCO.

It tells us truly the Minute, Hour, Day of the Week and Day of the Month.

HORTON'S PATENT CALENDAR CLOCK!

MANUFACTURED BY THE

ITHACA CALENDAR CLOCK COMPANY,

Ithaca, N. Y., and for sale by

W. J. EGBERT, Agent,

At Jon M. SEAMAN & Co's, 631 WASHINGTON STREET, San Francisco.

THIS TIME PIECE costs but a trifle more than any other good clock, and is just the article for every well-regulated business house, office, saloon, or, in fact, any place where a handsome, perfect time-keeper is duly appreciated. The Clock has two dials, the first being the same as an ordinary clock, the second has but one pointer, and shows the day of the week, the month and day of the month. It is arranged to mark the days in leap years with equal regularity. It is an eight-day piece, and runs from year to year without change. It can be examined at the Office of the MINING and SCIENTIFIC PRESS.

[Written for the Mining and Scientific Press.]

The Shasta Silver Mine.

EDITORS PRESS:—In compliance with your request for more information in regard to the silver mine from which the cabinet specimen presented you by C. F. Ellsworth, Esq., alluded to in last week's issue, was taken, I have to say, that the Chico silver mine was discovered by Mr. N. S. Batchelor about the middle of May last, on the south fork of Clear creek, eight miles southwest of the town of Shasta, in Shasta county, Cal. The formation of the country is entirely granitic, the lode on the surface from 13 to 22 inches thick, almost perpendicular, and runs in a southwest and northeast direction, through a mountain probably 750 feet high, near a stream affording ample water power nearly all the year round, and with an unlimited supply of oak and pine wood for all purposes, accessible by good roads at all seasons of the year, and near cheap and abundant agricultural supplies of every kind. The mine was placed under contract by the company to Robert McCall, to be prospected, with the privilege of purchase, for three months, at a stipulated price. Mr. McCall has been running a tunnel on the lode, which is now in about 130 feet, and sinking a shaft with the lode about 65 feet in depth, with a run each way from bottom of shaft say thirty feet. The lode at that depth is four feet in thickness and increases rapidly, with two feet in thickness of such ore as the sample presented you and the balance good millable ore, estimated to be worth from \$50 to \$75 per ton, of which there is about 225 tons on hand at the mine. For two months past the contractor has been shipping first and second-class ores here and selling the same to Thomas Price, to be shipped to Swansea, the working assays of which show respectively the following results: First-class—\$269.64, \$292.26 and \$328 per ton; second-class—\$143, \$137, \$132, \$105.59 and \$84.85 per ton, those figures being the purchasing tests less the margin for profits. The point where the shaft and tunnel are commenced was a very rich outcrop of silver, that may be a chimney, and assumes the form, in prospecting, of a very large ore chute, apparently inclining in a southwest direction, while the dip of the vein is to northwest, at not exceeding an angle of three to five degrees. The lode is like a wedge, big end down, and, as above stated, has increased from thirteen inches on surface to four feet at depth of 65 feet.

The lode is well defined for a great distance, and is encased with a hard granite wall on each side, from which it is separated by what is called a gouge of tough clay, an inch and one-half thick on the hanging wall. The wall rock presents a greasy appearance, and the whole claim has all the characteristics of a rich and permanent mine. **PROSPECTOR.**
San Francisco, Oct. 19th, 1866.

THE NATOMA DAM is being built under the superintendence of the man who built the great dams at Lowell and Lawrence. Its location is naturally and precisely adapted for this use; the very bed-rock is of an irregular conformation into which a dam can beet grapple itself. On both sides the hard, solid granite rises to a considerable height above the level of the dam without fault or fissure. The foundation stones throughout are countersunk in the bed-rock to the depth of from one to two feet. Great care has been taken to place each block on even bearings, so as to preserve its entire strength. The height is about forty feet above the general level of the river bed; the length is about three hundred feet on top, and the base forty feet in width. The slope of the back of the dam from a short distance above the bottom is one to one, and the batter of the face is one to ten. The whole dam, face and back throughout, is constructed of long, large blocks of granite, point dressed and carefully fitted. The whole is completely laid in the best hydraulic cement.—[Folsom Telegraph, Oct. 20.]

A HOAX.—The story of the invention of a bullet-proof coat, which recently appeared in the *Nord*, turns out to be a hoax. The pistol was loaded with a small cork only, and the factitious bullet, which was afterwards shown to the astonished spectators, was dropped upon the floor by the perpetrator of the hoax the moment the weapon was fired.

CALIFORNIA FRUIT FOR THE WORLD'S FAIR.—We learn that California will be represented in the fruit department at the World's Fair at Paris, in 1887, in the following manner: Some months since, a gentleman who has a fine vineyard and orchard near Alviso, had a number of water-bottle shaped jars made at the San Francisco Glassworks at Steamboat Point. These jars have a mouth about 2½ inches wide, are 12 inches high, and have a round-bottomed bottom six inches wide, with a small hole in it. The jars were to be placed over young fruit, so that it could in time fill the inside, accommodating itself, in growing, to the shape of the jar. The fruit when ripe is to be carefully cut off and the stem secured, so that a cork can be sealed over it. Through the hole in the bottom the jar is to be exhausted of air and hermetically sealed. It is said that the absence of air will insure the keeping of fruit for an indefinite time, while the jars being strong will admit of safe transportation to any part of the world. The jars being of white glass, the fruit can be plainly seen through them. It is probable that similar attempts to preserve green fruit for the Paris Exhibition are being made in other portions of the State.—*Bulletin, Oct. 20th.*

THE Western Union Company already own 100,000 miles of wire, and have a controlling interest in the California State Telegraph, which, it is expected, will ere long be wholly in their hands. Two distinct lines will soon vibrate between Chicago and San Francisco, put up on separate poles the entire distance, though following the same route, except the divergence at Julesburg to Denver, which takes the main route again at Ham's Fork. A line hence to Vancouver Island, via Boise and Walla Walla, would be greatly serviceable to business interests, and is among the early probabilities. As fast as the rail-cars come westward from Omaha, it is determined to erect a line parallel with the track, with four wires on cross-pieces upon cedar posts, which will be the finest line in the world.—*Salt Lake Telegraph, Oct. 11th.*

NEW MUSICAL INSTRUMENT.—A new musical instrument has been introduced in Paris. It resembles a piano with upright strings, except that the latter are replaced by tuning forks, which, to strengthen the sound, are arranged between two small tubes, one above, the other below them. The tuning forks are sounded by hammers, and are brought to silence at the proper time by means of dampers. The sounds thus produced resemble those of the harmonium, and are extremely pure and penetrating.

Auction House.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 413 Montgomery street—a very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS, And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the MINING AND SCIENTIFIC PRESS.

At the Golden State Iron Works, No. 19 First street, San Francisco.

CAUTION!

NOTICE—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1884, and tested June 27th, 1885, to Professor Henry Wertz, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY, OF NEW YORK,

Assignees of letters patent granted to Prof. Henry Wertz, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.

The terms and conditions upon which rights to use the process are obtainable, can be had on application to: WM. SLOSSON, Agent of the Company, Union Iron Works, corner of First and Mission street, San Francisco. 14v13

NEW YORK PRICES.

C. E. COLLINS,
No. 603 Montgomery street, San Francisco.
EXCLUSIVE AGENT
FOR THE
AMERICAN WATCH FACTORY.
A large assortment of these
Superior Watches,
In Gold and Silver Cases,
Constantly on hand, and sold at Factory prices. Also,
ENGLISH AND SWISS WATCHES,
Imported directly from the Manufacturers.
The American Company are now making
VERY FINE WATCHES FOR LADIES.
A large assortment of Gold Chains and Jewelry. 12v10-6m

WATCH REPAIRING AT NEW YORK PRICES.

NEW YORK PRICES.

STANDARD SOAP COMPANY'S WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material and contains nothing that will injure the finest fabric. Equally as good for use in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1 lb each, and in wooden boxes of 10 lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 15v12q

WE ARE NOW OFFERING OUR IMMENSE STOCK

Fine Custom Made Clothing

Gents' Furnishing Goods
AT PRICES THAT DEFY COMPETITION.
Our Stock of Clothing Consists of
ALL THE LATEST STYLES

BOTH OF MATERIAL AND FINISH.

A Large Assortment of
Trunks, Valises, Carpet Bags, Blankets, Etc.,
AT EXTREMELY LOW PRICES.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 8-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....850
No. 3.—Or 24-inch Crusher, with in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient light to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the link or radius bar. C represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1885. JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations, and I have no hesitation in recommending to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1885, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1885.

BRODIE'S PATENT WIND-ELAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations are offered on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 12th, 1885.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power!

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price. These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises), in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world. All sizes on hand from 3 to 30 horse power, with an without carriages. Also, Portable Saw and Orist Mills. For sale by
TREADWELL & CO.,
Corner of Front Market and streets
18v12

EASTERN MACHINERY FOR CALIFORNIA.—We have repeatedly spoken of the absurdity of sending East for mining machinery, while our own manufactories are turning out such splendid work in the way of those machines which have been tried and approved on our own ground. The following, from the *Bulletin*, is in point:

About a year ago a large quantity of mining machinery was received in this city, which came from New York via the Isthmus. The machinery was sent by a New York company, with the intention of erecting a mill at Reese River, Nevada, and comprised, among other articles, a 60-horse power engine, boilers, extra castings, a crushing machine, and even window frames, on the whole of which was paid three cents—gold—per pound freight to this port. From some cause the company recalled their Superintendent and stored the machinery in this city, and now are offering the latter for sale. The first or invoice cost of the shipment was about \$40,000 in greenbacks, and at least half more has to be added for freight and other expenses to date, making a total of \$60,000. The mining machinery being the fruit of some theoretical, scientific gentleman in the Eastern States, is considered almost worthless alongside of the improved machinery used on this coast, and will bring only the price of old iron, the entire invoice not being valued at over \$8,000 gold. The machinery of a mill of the size with a 60 horse power engine to run it, competent parties assert can be furnished by our foundries for less than \$20,000 in gold, in this city, about half the amount the almost worthless machinery from New York cost. Months of time could also have been saved in getting the machinery ready for use, and in the contingency which has arisen requiring its sale it could have been disposed of to other parties at a very small loss from first cost. The people of the Eastern States must have a very poor idea of the progress of mechanics and mining knowledge in California, when they ship mining machinery and window frames to be used on the Pacific coast.

The above is, it is true, an unusually expensive experiment of the kind; but for the last ten years or more, the most absurd contrivances have from time to time been imported into our State by parties who have lent a listening ear to *unpractical* inventors. Most of these machines now lie in forgotten rubbish heaps, monuments of folly.

WORDS FOR MINERS.—The *Gold Hill Daily News*, Nevada—a medium of good authority—saith thus:

The *MINING AND SCIENTIFIC PRESS* is a weekly journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would tend vastly to the particular "posting" and general enlightenment of our sort of working folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have an agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

103-104.—Messrs. Garrett & Rowe, owners of large Sulphur claims in Colusa county, have sent us some fine specimens of sulphur from that locality. One of the samples appears to be a combination of sulphur, siliceous and alumina, with from fifty to eighty per cent. of sulphur. Some of the specimens are almost pure. There is an abundance of wood directly at the foot of the mountain, where they propose to put up the retorts for obtaining the pure article, and to which the raw material can be conveyed in "chutes" directly from the summit of the mountain. The locality is about four miles east of the west line of Colusa county, and about eight miles from the deposit now being worked by the Borax Lake Co. The cost of shipping from that point, with a good wagon road, will be about the same as from the Borax Company's sulphur mine.

105.—Black oxyd of manganese, from Red Island, San Francisco Bay, presented by Mr. R. E. C. Stearns. A large amount of this mineral has been obtained from the locality mentioned, and a shipment of the same has recently been made to England, for testing its commercial value in that market. The supply of this mineral has hitherto been chiefly obtained from Ohio, Virginia, and near St Johns, N. B. Large quantities have been shipped from the last mentioned locality to England. Manganese is extensively used for bleaching purposes, in the manufacture of glass, steel, varnish, refining of coal oil, etc.

106.—Presented by Charles H. Leach. Silver and gold ore from El Dorado Cañon, Arizona. This is reported to assay \$400 per ton.

107.—Presented by Charles H. Leach. Copper and silver ore from Durand Pass, Los Angeles County, Cal. Fifty-six per cent. of this is said to be metallic copper, and the ore assays, in silver, at the rate of \$164 to the ton.

108.—Yellow sulphurets of copper, encrusted with asbestos, from the Fox copper claim near Colfax. Presented by Mr. Thorpe, one of the proprietors of that mine.

SAMPLES of California wines, of from three to six cases each, are being forwarded from various parts of the State for the Paris Exhibition. Cutlery, woolen goods, and other articles of California manufacture, are being made ready for the same destination.

COMMUNICATION.—From "G. F. D." Meadow Lake, will be attended to next week.

PATENT SELF-FEEDING METAL DRILL.

We have here a fine engraving of Warren Lyon's self-feeding hand and power metal drill, a machine which, we are informed by the proprietors, has been introduced with much

drill, for the purpose of giving the requisite pressure, and in having a system of levers and a counterpoise connected to the upper part of the arbor, for the purpose of elevating it and graduating the pressure communicated to the drill by the weight upon the arbor. The drilling

The feed being always of the same pressure, enables it to drill fast without the danger of breaking the drill, which often occurs in drilling small holes, where the pressure is obtained by a screw or lever.

The article to be drilled is placed upon the bed plate, H, and the drill bears upon it with sufficient pressure to give the necessary feed, owing to the balance wheel, A, as shown, which serves to steady the action of the drill and also as a weight. The upper end of the spindle is provided with a swivel joint, B, to which the lever, C, is connected; by working the second lever, D, which is attached to the first by a link, E, the brace and wheel may be elevated so as to put the work in place. There is also a hook, F, which fastens over a catch, G, on the post, and keeps the wheel suspended while the work is adjusted. The table, H, is made to raise and lower to suit different kinds of work. This drill may be erected any where, and is very easily turned by a stout boy.

LYON'S PATENT SELF-FEEDING METAL DRILL—Fig. 1.

favor into many car, truck, carriage, and other manufactories and machine shops in the Eastern States. It appears to us to be admirably adapted for light and varying work.

In Fig. 1 of the illustration there will be observed a weight attached to the arbor of the

machine has a gauge connected with it, so that any number of holes can be drilled or counter-sunk to any depth, say from an eighth of an inch to three inches, and they will all be the same, without spending any time to measure them. It can be used either by hand or with power.

Fig. 12.

Fig. 2 represents an attachment used for drilling bars endwise, for the reception of bolts or other pieces. Either a round, square or flat bar can be held in it; the table or bed plate H, is removed at pleasure, so it may be secured to the arm holding the table.

Further information concerning these drills can be obtained by addressing Messrs. Lyon & Isaacs, Box 5,475, P. O., New York.

CIRCULAR AND PATTERN LIST OF THE UNION FOUNDRY.—We acknowledge the receipt of several copies of a book of one hundred and forty-eight pages, octavo, with the above title. It is bound in morocco and gilt, making a handsome and substantial volume. In the table of contents we notice articles on various processes and subjects interesting to millmen and mechanics. The book conveys a good idea of the extensive works of Messrs. Booth & Co., the largest foundry and machine shop on the Pacific coast. We anticipate quoting from its contents in future issues.

A NEW STYLE OF ORDNANCE.—Señor Gonzales, a Mexican, has applied for a patent for a new breech-loading cannon. It is of the ordinary shape, except the breech, which is heavier than usual, and oval in form, with a projection on the under side. At the butt is a screw-plug, in which is an opening twice the size of the caliber of the gun, through which the cartridge is introduced. By turning the plug the breech is closed. It is claimed that it can be loaded and fired sixteen times per minute. Experiments have been made with it at the Presidio, which have proved satisfactory.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Effect of Heat on Sulphate of Copper.

BY E. PIQUE.

All the works on chemistry state the fact that sulphate of copper, if exposed to heat will lose its sulphuric acid, and the residue will be oxyd of copper. This certainly will be the *ultimate result* if a bright red heat be applied, and sufficient time allowed, particularly under free access of atmospheric air. But if we enclose the sulphate of copper in an appropriate vessel and gradually apply heat, even up to dark red heat, it will first turn *white*; after that it will assume an *orange color*, and later, a *dark flesh or copper color*; when we now discharge the contents, and treat them with very dilute sulphuric acid, we obtain at once a *bright red precipitate*. All these reactions show very plainly, not only that a dismissal of the sulphuric acid has taken place, but that the oxyd of copper has parted with some of its own oxygen, so that it has changed into protoxyd.

The anhydrous sulphate of copper being white, and the oxyd of copper black, a mixture of both should be gray; and if the operation should only consist in the discharge of the sulphuric acid, as generally imagined, the color should change from white into gray, and from gray by degrees into black; but such is not the case. Now what is the cause of the oxyd of copper being deoxydized? The sulphuric acid cannot deoxydize it, as sulphuric acid rather acts as an oxydizer on different metals at the expense of some of its own oxygen, as everybody knows; but is never known to deprive the oxyds of their oxygen. The oxyd of copper, by itself, has no inclination to part with any of its oxygen. What then can be the cause of it? I solved this problem by the following reasoning: If the sulphide of copper be heated in a closed vessel, it loses one-half of its sulphur, and changes into protosulphide of copper (one equiv. of copper + half an equiv. of sulphur). In like manner the chloride of copper, under the same conditions, gives up half its chlorine and changes into protochloride of copper. Arrived at this point, I could not proceed with my reasoning under the old formula of the sulphate of copper ($\text{SO}_3 + \text{CuO}$), and I have been obliged to adopt the formula of $\text{SO}_4 + \text{Cu}$. If, then, the chloride of copper loses by heat half an atom of chlorine, we may infer by analogy that the sulphate of copper loses half an atom of SO_4 , the latter being the constituent of the sulphate of copper, corresponding to the chloride of the chloride.

According to this view, no reduction or deoxydation has taken place, since the copper in the sulphate existed originally in the metallic state, and the result of heat, excluding the action of air, will be *one atom of copper + half an atom of SO_4* , which, when treated with water, will show the known reactions of the protoxyd of copper; and the above facts prove most conclusively that the sulphates do not contain the metals in an oxydized condition, but as *pure metals*.

MOLDS FOR CASTING STEEL, IRON, ETC.—Mr. Frederick Trachsel, analytical chemist, and Mr. William Hall, brassfounder, Manchester, have patented certain improvements made by them in molding for casting steel, iron, and other metals. According to the usual process of molding for casting, it is well known that sand is employed, which is more or less siliceous, the silica of which, when submitted to the melting temperature of certain metals, becomes fused and combines with the said metals. This invention consists in substituting for the aforesaid sand a material which does not substantially contain free silica, lime, or other material which will fuse at the melting temperature of the metal to be cast. With this view, materials with an aluminous base, having been previously reduced to a state of powder, are employed in place of the usual sand, and after the ordinary manner of molding. As illustrative of the invention, coal-shale or fire-clay ground when dry to a powder, may be used as above described.—*Col. Guardian, Sept. 15th.*

[Written for the Mining and Scientific Press.]

Placers of Sierra County.

BY AN INVESTIGATOR.

EDITORS PRESS:—The area of the unworked placer ground of Sierra is probably not only of greater extent than that in any other county in the state, but unsurpassed for its richness, chiefly owing to an ancient river and its tributaries having coursed through the county in a northerly and southerly direction. Notwithstanding that it has formed the principal mining of the county for nearly twelve years, yielding fabulous returns, the workings only serve to show the almost inexhaustible character of the deposits from the small area worked. The river channel and its contents were preserved from denuding agencies by a covering of volcanic material, that at a time anterior to the upheaval of the Sierra Nevada range to its present height, must have flowed from a series of fissures and volcanic vents, extending on a line parallel with the river and easterly, flowing southerly and westerly, not only filling the river bed and its tributaries from ridge to ridge, but covering an area of hundreds of miles for hundreds of feet in depth. At this time the shores of the Pacific washed the base of the Sierra Nevada range, since which the upheaval of the Coast Range of mountains has removed the shores of the Pacific from sixty to eighty miles westerly. A corresponding upheaval in the Sierras ensued, changing the entire face of the country. New channels were formed, an entire new system of rivers created, coursing easterly and westerly, at right angles with that of the ancient, which had a southerly trend, nearly parallel with and similar in many respects to the River Sacramento, but lying easterly, and at a distance nearly corresponding with the removal of the shores of the Pacific. This river coursed with the stratification naturally selected for its bed, the softer and more friable magnesian and talcose rocks, or the easily decomposed feldspathic igneous rocks, cutting deep gorges in these, the main metalliferous belts of the Sierras; pulverizing their powerful veins of auriferous quartz, and freeing its gold, which, from its specific gravity, soon found a resting place with quartz boulders and pebbles in its bed. The lighter magnesian detritus either formed its heavy banks of clay (pipe clay) or was carried off by the rush of waters. It is the extensive denudation of this auriferous belt—assisted by an immense flow of water, caused by the rapid melting of extensive glaciers and snows which capped the Sierras—(of which we have abundant evidence in the glacier-marked rocks)—at the time of the outbreak of volcanic forces along its entire range from north to south, its melted lavas at intervals and at points in near proximity flowing into its channels, filling them from ridge to ridge—thence downward and onward in its bed, damming the rivers for hundreds of feet in height, forming immense lakes overflowing their banks—cutting down entire ridges from river to river and from fork to fork, emptying the contents of its beds into other sister channels—crushing, breaking and tearing through every obstacle with the irresistible force of accumulating and pent-up waters—that has so greatly enriched our placers and formed the several classes of mining known as hydraulic and tunnel diggings. The destruction of these ancient river channels in places, by the denuding agencies of the present river system, though not so violent in its effect, has been slow but sure;—cutting down through the almost indestructible lava beds of volcanic cements to the river beds—scattering their precious contents and cutting still deeper gorges from 1,000 to 2,000 feet—by a kind interposition of Providence freeing from their rocky fastnesses the rich stores of golden treasure, and distributing them where the penniless adventurer and laboring man have reaped, with no other capital but their own strong arm and determined will, rich harvests—completely reversing the hitherto established order of society. All professions, trades and occupations were represented in the melody of gold seekers; pick, pan and shovel the implements—pen, gown and scientific acquirements at a discount, and digging for gold the order of the day. Before describing the placer localities alluded to, I will endeavor to trace the approximate course of this ancient river and its tributaries, which by consent of the

reader and for my own convenience, I will call the *Dahlonaga*, (the Indian for place of gold). On the west we find three main branches or forks, which I will designate as the West Fork, Middle Fork, and North Fork; on the east, two branches of note—the Southerly the *Saranac*, (the river that flows under rocks); the northern branch the *Altan* (gold). There are several other unimportant branches emptying into the Dahlonaga from the eastward, which I will not attempt to locate.

[To be Continued.]

[Written for the Mining and Scientific Press.]

The Murphy Mine—Nevada.

BY J. D. EMERLEY.

AUSTIN, NEV. Oct. 20th, 1866.

EDITORS MINING AND SCIENTIFIC PRESS:—In Ophir Cañon, Twin River mining district Nye County, State of Nevada, is located the silver mine bearing this name. It crops out in crossing the cañon two and a half miles from Smoky Valley, and about 1,600 feet above the level of the latter. The course of the vein is nearly north and south, its dip being easterly at an angle of forty degrees. The lode appears to be twenty feet wide, but the richest portion of it varies from three to eight feet in width. When it was discovered in June, 1864, some beautiful specimens of native silver were found in the croppings, and occasionally delicate flakes of virgin metal are seen in the seams of the quartz now being extracted. The Murphy, the Green and the Twin ledges, three parallel locations each of 1,000 feet, running northerly from the cañon, passed into the hands of the Twin River Silver Mining Company of New York, in August, 1865. The locators received \$50,000 in gold for four-fifths of the ground, and \$60,000 of unassessable stock; the subscribed working capital of the company being \$300,000. Immediately on completion of the purchase, steps were taken to build a road from Smoky Valley to the mine. Owing to the steep and rugged nature of the ground, this was no easy undertaking, but a passable road was opened in about two months by an outlay of \$5,000. Work has been prosecuted on the mine steadily for fourteen months, and though thousands of dollars have been thrown away, through ignorance in mining matters of the New York agent, and his mismanagement generally, yet it is now clearly demonstrated that the Murphy is a mine of immense value, and quite capable, with anything like sensible management in the future, of yielding handsome dividends, even on the heavy expenditure which has been so needlessly incurred, both on the mines and mill of the company. As the mining operations are now controlled by an experienced Cornish miner brought from Lake Superior, there is a likelihood of sound judgment being displayed in time to come in connection with the developments.

The Murphy mine can scarcely be said to be prospected yet, as it has not been penetrated to a greater perpendicular depth than seventy or eighty feet. The hoisting, by means of a whim and "whipsey-derry," is through a shaft thirty-six feet deep, at the bottom of which an incline follows the dip of the vein some fifty feet downward. In the lower level, running northerly 200 feet, a fine body of heavy black sulphuret ore has been exposed, which with very little assortment will work \$200 per ton. In the south drift, a solid mass of \$300 ore has been penetrated, and from the incline and upper works good pay mineral is being taken out all the time. The company have a fine 20-stamp dry crushing mill, with all the necessary roasting furnaces, pans and settlers ready to go into operation, and unless there is great mismanagement in the working of the ores, satisfactory accounts of the yield of bullion may be expected in a few weeks. About 1,200 tons of pay ore are now on the dump, and enough can be brought to the surface from day to day, to keep the mill in steady work from this time onward. In neglecting to put hoisting machinery on the mine, considerable risk is being incurred from the probability of a heavy body of water being struck; but even in that case the suspension of operations would only be temporary.

A great deal of prospecting has been done in the Twin River district, and no doubt some of the numerous locations will prove valuable,

but hitherto nothing has been struck comparable to the Murphy ledge. The San Jose, as a gold bearing vein, yielding ore worth from \$100 to \$300 a ton, is certainly fine property, and the Ophir and other lodes, giving assays of silver \$50 to \$100 a ton, from the croppings, are worthy of attention. The discovery, however, of such astonishingly rich ledges as those of Hot Creek and Danville, sixty to seventy miles east of Twin River district, has for the time being thrown the latter into the shade, and it will probably be years before its mines generally receive the attention which they merit. A stream of pure water is running in every cañon, and wood will not exceed \$8 to \$10 a cord for several years, so that the expense of milling is not very extravagant. Good miners are paid \$4 to \$5 in gold per day, and board costs \$10 per week.

Brevities.

THE *Bee* says the arrivals of grain from the upper Sacramento are just now enormous.

THE Nicholson pavement seems to be gaining favor in New York.

MR. CLAUSZ, of Stockton, has made one hundred dozen brooms within the last month. It is said that the fire in the Bellingham Bay Coal mine is not yet extinguished after all.

GAS odors are said to be a preventive of cholera. The statement requires corroboration.

TWO tons of marble were sent to San Francisco from one quarry in Columbia, during the last week.

A MINING COMPANY in Louisiana has struck a solid block of pure lead, estimated to weigh thirty-three tons.

ONE hundred and twenty millions of steel pens are yearly made at the "Victoria Works," Birmingham, England.

NEARLY two hundred tons of grapes have been raised at the Natoma Vineyard in Folsom this season.

THE entire privilege of "sticking bills" on the inside and outside of the Paris Exhibition building has been sold for half a million of francs.

A LETTER from Australia says the gold fields of that country are rapidly becoming exhausted, and that those of New Zealand are answering the most sanguine expectations.

M. BAZIN, a French artist, takes photographs of sunken vessels by means of a strong sheet iron box with thick glass windows, which he calls his "photographic chamber," and with the aid of a powerful electric light.

LEADEN BULLETS are sometimes pressed instead of cast. It is now said that they are unreliable, for they are not only heavier than the others, but they gradually expand, so that after a time they regain the natural porosity of the metal.

THE locomotive whistles on the New York and Albany railroad are pitched upon a lower key than usual, and the improvement is duly noticed and appreciated by the people who live near the road. The shrill shriek of the older style was ear-piercing and injurious to invalids.

THE Wilmington, Los Angeles Co., *Journal*, says, in regard to the murder of Herman Ehrenberg: "There is ground for grave suspicion; the story of the crime having been committed by Indians appears to us doubtful; and we think the affair demands immediate and close investigation."

IT is reported that the Maryland Mining company, composed chiefly of Philadelphians, have got a steam mill nearly ready for quartz crushing. They bought a tract of land, about two miles below the great falls of the Potomac, of some one hundred and twenty acres. They have sunk several shafts and run some drifts, and in these have found "several well defined veins of gold-bearing quartz, which assays from \$40 to \$2,500 per ton."

A. M. TAYLOR, of Alameda county, intends to enter largely into the business of raising trout. A two-horse wagon load of live trout, from Lake Tahoe, had at last accounts arrived Oakland, on their way to the ponds which he has constructed on the margin of San Pablo Creek, eight miles north of Oakland. This is his third attempt; in the two previous, the fish had been killed by being supplied with water containing something which did not agree with them.

THE total value of the prizes to be given at the Paris Exposition is \$160,000 in gold. In the department of arts there are seventeen grand prizes, valued at \$400 each; thirty-two first prizes, valued at \$160 each; forty-four second prizes, valued at \$100 each, and forty-six third prizes, valued at \$80 each. Besides these there are to be various other grand prizes and allowances of money, of a total value of \$10,000; 100 gold medals, \$200 each; 1,000 silver medals, 3,000 bronze medals, and over 5,000 "honorable mentions."

Mechanical.

PHOTOGRAPHING CANNON BALLS.

The London *British Journal of Photography* gives a very interesting account of some experiments in the photographing of guns while being fired. In the pictures which were taken, the moment had been so exactly seized that the ball could actually be seen protruding from the muzzle of the gun, while, as we might say, in the very act of leaving it. A description of the mechanism by means of which this exactness was secured, will be interesting. It will of course be evident that no person, however delicate his perception, could act with sufficient quickness to expose the plate at the exact instant desired. It could only be done by means of electricity. A stereoscopic camera is arranged with a disk in front of the lenses, revolving on its axis. This disk has two holes in it, either of which can be made, by its revolution, to correspond with the line of the lenses. A circular spring is so attached to the disk, that when set free it will make a half revolution with the quickness of a flash, thereby bringing one of the holes in a line with the lenses and admitting the light for an instant. Now for the manner in which the disk is set free. First, the disk is "wound up," so that the spring referred to is, at its utmost tension. It is retained in this position by means of a catch and trigger, which latter is connected with an electro-magnet. The gun is fired by means of a tube containing gunpowder, through which runs a delicate platinum wire. When a galvanic "shock" is sent through this wire, it instantly becomes red hot, and melts. Two things are by this accomplished simultaneously; first, a current of electricity is transmitted which vivifies the electro-magnet and causes it to attract the trigger, thereby releasing the disk; and second, the powder is ignited and the gun discharged. In order that the aperture in the disk should be retained in a line with the lenses until the powder is fairly ignited, a stop holds it in that position until the wire melts. At that instant the continuity being broken, the electro-magnet ceases to act, nothing prevents the continued action of the spring, and the disk is carried round far enough to close the camera. The manner by which these two movements, so nearly contemporaneous without being exactly so, are thus effected, is exquisitely ingenious.

Steel Gun Barrels.

It has long been a desideratum that some economical method of manufacturing gun barrels of steel should be devised. The only method, worthy of note heretofore, has been that of forging the solid bar, and then boring it. This is slow work, and can only be done by machinery which moves with great nicety. A new process has been recently patented in England by Messrs. Deakin & Johnson, which bids fair to be a success. We quote a brief description of it from the London *Colliery Guardian* of September 15th:

"A round bar of Bessemer steel is cut into lengths, which are heated in an ordinary furnace. The short round block is then put under a vertical punch of considerable power, which is worked by steam, and a hole punched through it—an operation which requires only a few seconds. The perforated block is allowed to cool, and is then carefully examined to see if any cracks appear on the outer surface. The expansive force required to pierce a hole through a solid lump of steel necessarily subjects its outer particles to a severe strain, and is sure to develop any inherent defect, whether arising from faults in the material or unskillful workmanship. Should any external cracks appear, they are carefully cut out with a chisel if shallow, and if they penetrate deeply the block is rejected. Thus the first operation applies a most severe test to the metal. A piece of steel which can sustain without a flaw a force sufficient to punch a hole through it, will not give way from the explosion of any charge of powder to which as a gun barrel it can ever be submitted. The steel barrel having thus been perforated requires only elongation and reduction in thickness. This is effected by heating it and passing it through a succession of grooved rolls, with a mandril in the hollow of the tube, when it is ready for the lathe."

All attempts to produce a good barrel by

casting have failed. The welding of steel is a nice operation, and on a large scale cannot be depended upon. By the process above described, a perfect barrel can, it is said, be produced at a cost not exceeding that of an ordinary welded iron one.

Krupp's Steel Works at Essen, Germany.

The following, from the London *Mining Journal* of September 8th, will be interesting:

At the death of his father, in 1827, Alfred Krupp succeeded at the age of 14 to a small workshop for the manufacture of cutlery and rollers for gold. His genius and energy soon drove him forward, and by his courage, skill, and good fortune, he has become the sole possessor of an establishment which last year turned out upwards of 50,000 tons of cast steel, one-third of which was made into guns, the rest into bars, shafts for engines, axles, railway bars, tyres of wheels, plates for boilers and ships; in short, anything requiring at the same time strength and hardness. The works exclusive of the blast-furnaces, cover 400 acres of ground, consume 750 tons of coal daily, use the steam of 120 boilers, burn 7,000 flames of gas, and give employment to above 8,000 men and boys, whose wages amount to nearly £400,000 a year. The importance of retaining as nearly as possible the same men being fully recognized, a fund has been created, to which every man or boy employed must subscribe, and out of which he commands advantages sufficient to make it well worth his while to stick to his work. The rates of subscription and proportionate advantages are regulated by the wages, the higher grades of workmen subscribing 1d. and the lower $\frac{1}{2}$ d. per thaler (3s.). Mr. Krupp adds a sum equal to half that subscribed by the men. From the resources of this fund a workman can claim a pension sufficient to live upon respectably after 25 years' labor. Men injured in the service receive full pay for as long as they may be unable to work; the sick are treated and liberally provided for, and the dead are buried. Finding that the bread supplied to the men by the ordinary bakers was deficient in quality and quantity, considering its price, Mr. Krupp built large bakeries, whence he supplies excellent bread at cheap rates, buying the flour wholesale from Russia, and charging only a small profit. Similar arrangements are made for the supply of potatoes, and it is contemplated to extend the system to meat. This paternal management is very successful, and appears to work well for the interests of both master and men. Though a system of the same kind is carried out in some of our greatest establishments, it is not so thorough, nor on so great a scale. The working hours are divided into only two parts—the day's work from 6 A. M. to 7 P. M.; the night's from 7 P. M. to 6 A. M.

The largest steam-hammer weighs 50 tons, and is single-acting, with a 10-foot drop. It cost about £100,000, of which two-thirds was for the bed; and Krupp has obtained the necessary concession from the Prussian Government to permit him to build a 120-ton hammer, which is to have a 13-foot drop, but whether single or double-acting is not yet, I believe, determined. It is estimated to cost £200,000. Two huge guns, which are to be about 16 calibers in length, and to weigh 28 tons, are being manufactured for the Russian Government, and will cost £7,000 each. They are to be breech-loaders, on Krupp's principle, throwing a projectile of 540 pounds, with a charge of 50 pounds of prismatic powder, and are intended for the defenses of Cronstadt. A 15-inch breech-loading gun has been commenced, which will eventually belong to the Russian Government. It is to be exhibited at the Paris International Exhibition. The projectile will weigh about 900 pounds. The foundry is a very large building, with furnaces capable of heating upwards of 1,200 crucibles at once, that number being actually used for some of the largest casts.

INDIA-RUBBER TYPE.—A manufactory for making printer's type of vulcanized india-rubber has just been started at Dalston. This new style of type is said to be as quickly and easily made, and to be fully equal in quality and durability to the common type, the cost price being only one-third of the latter. It offers the advantage of less weight as compared with metal type, and it can be remodeled when worn. It presents particular advantages for stereotyping. The invention is American, and is said to be making rapid progress in England.

THE PENNSYLVANIA STEEL COMPANY are erecting extensive works near Harrisburg, for the manufacture of Bessemer steel. They will commence with an annual capacity of 15,000 tons. Steel will soon supersede iron for many purposes.

Scientific Miscellany.

LATEST DISCOVERY IN ELECTRICITY.—The *Practical Mechanics' Journal*, of June last, gives an account of some experiments of Mr. Wilde, which were brought before the Royal Society, by Professor Faraday, at a recent meeting of that body. Mr. Wilde had discovered the fact that a large amount of magnetism can be developed in an electro-magnet by means of a permanent magnet of much smaller power. Reasoning from this fact, that, as an electro-magnet, when excited by means of a voltaic battery, possessed all the properties of a permanent magnet, a large electro-magnet, if excited by means of a small electro-magnetic machine, could be made, by means of suitably arranged apparatus, to evolve a proportionate amount of dynamic electricity, he proceeded to prepare such an apparatus. The details of the arrangement we must omit, for want of the diagrams necessary to illustrate it. The result, however, was that "quantities of electricity far exceeding that obtainable by any other means hitherto used were given off. The illuminating power of the current thus obtained was of the most splendid description. With this arrangement placed upon the top of a lofty building, the light evolved was sufficient to cast shadows from the flames of the street lamps a quarter of a mile distant, upon the neighboring walls. The calorific power of the current was so great that it melted pieces of iron rod fifteen inches long and a quarter of an inch in diameter. The invention is of special value for lighthouse illumination."

CHEMICAL NATURE OF CAST IRON.—At the British Association meeting Dr. Russell read a preliminary report, prepared by Dr. Matthieson, F.R.S., "On the Chemical Nature of Cast Iron." Facts were quoted to show that the crystallized alloys of carbon and iron do not prove the existence of chemical combination between them. In all probability, by altering the conditions of cooling, etc., crystals of iron containing various amounts of carbon might be obtained from the same sample of cast iron. Data were given to show that the alloys of iron follow in some cases the same laws as other metals; and in order to see whether the assumption as to the chemical nature of cast iron was correct it was proposed—1. To make some pure iron. 2. To alloy the pure iron with various amounts of carbon, and to test the physical and chemical properties of these alloys. 3. To alloy the pure iron in different proportions with other metals and metalloids. From the foregoing considerations the author expected to be able to produce analogous alloys to iron and carbon, with some other metals having the peculiar properties of cast iron, steel, and wrought iron, and probably some may be found to be much better adapted for certain purposes than the alloys of carbon and iron; for instance, less liable to become crystalline by age, etc. 4. To alloy the pure iron with various amounts of carbon, and to add to these alloys such substances as are found in the commercial iron, so as to study their respective effects on the physical and chemical nature of cast iron, and more especially on their influence on the solvent power of iron for carbon. It is intended to investigate carefully the action of dilute and strong acids on the various alloys of iron and carbon, in order to see how far and under what conditions the carbon is evolved as carburized hydrogens. The experiments will be made upon a small scale, fusion taking place in one of Deville's oxyhydrogen furnaces, which gives an admirable means of experimenting with refractory metals. The pure iron will be partly prepared from the oxalate, and partly by the electrolytic process, and fused in lime crucibles.

PROFESSOR PLAYFAIR recently mentioned, before the British Association, as an object of peculiar interest, a furnace at the Alfreton Iron Works, which was forty or fifty years old, whereas the average duration of iron furnaces was only about four or five years. Recently a part of the wall was taken down for repairs, and he then had an opportunity of examining the whole of the furnace, and of ascertaining how it was that it had lasted so long. To his surprise he found it lined with plumbago three or four inches thick, not by the manufacturer, but by the operations of nature. This result he attributed to the carbon in the iron having been squeezed out; and the whole of the furnace was, probably, lined with plumbago.

LIGHTNING RODS.—The "lightning rod question" is exercising the minds of the readers of the *Scientific American*. "F. F. S." writes to that journal expressing his surprise that such an article as that written by "S. D. C." was allowed to appear in it, as it might "cause a great deal of mischief." "S. D. C." had said that lightning rods must not be insulated while "F. F. S." insists that one which was not insulated was worse than useless. The editor, in commenting upon the article of the latter, says that men "equally well experienced" hold diametrically opposite opinions on the question.

The discussion seems to us a singular one. Everybody knows that the electric fluid will take the shortest course, under given circumstances of conduction. Another equally well known fact is, that it will follow the best conductor. It follows that it is only necessary that the rod should be continuous. That its supports should be perfect insulators, is entirely unnecessary; it is only requisite that they should be worse conductors than the surface over which the rod passes. A block of wood is, in all ordinary cases, sufficient. In case the roof is a metallic one, safety would be secured by making the supports somewhat higher, in order to carry the rod at a greater distance from it. Not even glass supports of the ordinary height would be perfectly safe, under such circumstances. So large an expanse of conducting surface would be likely to interfere with its direct passage.

ALLOYS OF IRON.—Dr. F. Grace Calvert, in the course of a lecture on alloys, delivered before the Royal Society, says a few thousandths of carbon transform it into steel, and a few per cent. of the same element converts it into cast iron: a few thousandths of sulphur, or a few per cent. of silicon, renders iron "red-short"—that is to say, brittle at a red heat—while the same quantity of phosphorus makes it "cold-short," or brittle at natural temperature.

HARD IRON.—M. Gaudin has found that by adding to ordinary cast iron, in fusion, phosphate of iron and peroxyd of manganese, in certain proportions, he obtained a product of exceeding hardness. The resulting metal cannot be forged, but casts easily, and is, moreover, singularly sonorous; and he proposes it as a material for bells. He finds, also, that a still harder metal is produced by the addition of tungsten to ordinary cast iron. Crystals of it will cut glass as readily as the diamond.

THE *Chemical News* quotes from *Les Mondes* a simple mode of engraving, intended to replace wood-cutting: "The inventor starts with a smooth piece of chalk, on which he makes his drawing with gum-water, or something else that will harden on the chalk. He then, with a hard brush, scrubs out the soft part not drawn on, and so gets his design in relief. He subsequently hardens the plate by putting it in a bath of gelatine and then drying it."

DR. NEWBERRY, in an article on "Rock oils of Ohio," thinks he finds local proof of the distillation of the petroleum in the great bituminous springs of California from tertiary lignites, there being evidences of recent igneous action in the region. European geologists have attributed a similar origin to the petroleum of Italy.

AN ARTIFICIAL IVORY is made in France by M. Dupre, from a paste of papier-mache and gelatine. Billiard balls of this material can be thrown from the top of a house to the pavement without injury. "Parisian marble" is the name given to it.

THE action of sea-water on lead is nearly imperceptible. It could be used, therefore, to good advantage for preserving the keels of iron ships from corrosion. Its hardness could be increased by adding arsenic or antimony.

THERMO-ELECTRIC CURRENTS can be produced by percussion as well as by friction. This has been demonstrated by Prof. O. N. Rood, of Columbia College.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 3d, 1866.

The Money Market may be said to have become a shade easier since the departure of the last Panama steamer. The demand, however, is still beyond the supply, and rates in Bank continue to rule at 1½@1½ cent. per month. The line of transactions in mortgage loans is at present very large—far in excess of available funds applicable to this purpose in our local Savings Banks. We learn of loans being readily effected in the latter institutions at 1½ cent. per month, and even higher rates are mentioned. The movement of coin to and from the interior has been as follows during the first nine months of this year as compared with the same period in 1865:

	1866.	1865.
Coin received from the Interior.....	\$4,119,538	\$3,763,389
Coin remitted to the Interior.....	6,454,207	8,725,858

Added to interior circulation.....\$2,334,669 \$4,962,469

The Internal Revenue receipts at the Collector's office in this city for the month of October aggregate \$1,138,071.23. The largest daily collection was made on October 30th, amounting to \$133,032.80.

The coinage at the U. S. Branch Mint in this city, during the month of October, has been \$2,210,000 in gold, and \$102,000 in silver—total, \$2,312,000.

City Stocks remain quiet, with few sales in the Board. We note transactions in California Steam Navigation Co. at 68 cent., and Spring Valley Water Co. at 60½@61 cent. The latter company have declared the usual dividend on their capital stock, payable on the 10th inst. The 21st installment of \$10 per share of the South San Francisco Homestead and Railroad Association is now payable. S. F. & San Jose Railroad sold at 65 cent., and San Francisco Gas at 65 cent.

Legal Tender Notes sold during the week in the Board at 71½c, and 71½c seller 90 and 30; at the close we quote them at 70½c bid, and 71½c asked. Our latest telegraphic advices from the East, Nov. 1st, quote gold at 147½.

The Mining Share Market acquired a degree of firmness during the past week little looked for some time ago, and almost without exception shares were sold at a considerable advance. This appreciation, however, occurs to a more or less extent as the monthly period for the declaration of dividends approaches; still there is a more potent cause than this in explanation of the present rise. It is found that the lower levels on the Comstock lode have not yet become exhausted, and that recently some very satisfactory developments have been made at greater depths than hitherto attained. In this connection we might mention that late discoveries in the Savage mine fully substantiate the existence of valuable deposits of ore at points not yet reached by the deepest shafts.

Hule & Norcross still remains out of the market—continuing in firm hands. We quote it at \$1,800 bid, and \$1,900 asked. In sinking from the 700 to the 780-foot level a good body of ore, it is said, has been encountered at a point 27 feet below the 700-foot level. Up to the 29th inst., 2,531 tons of ore have been reduced, 65 per cent. of the assay value of which placed at the company's credit \$146,504. This gives an average yield of nearly \$58 per ton.

Savage has materially improved since our last reference, opening at \$1,250, buyer 30, gradually advancing to \$1,305, seller 3, then selling at a still further advance at \$1,400, buyer 3, and closing at \$1,385. During the week ending Oct. 27th, 1,617 tons of ore were extracted, 1,302 tons carried to the mills, and 690 tons left on hand at the mine. The assay value of bullion from the number of tons mined as above is given at \$76,545, which is an average of more than \$47 per ton. We have interesting information in regard to the developments of this mine since our last issue. In the sixth station, winze No. 2, has been

prosecuted to a depth of 28 feet, and it is said that ore averaging \$70 per ton has been found. On the upper station, south mine, the ore seam has widened to some 30 feet, and in the lower station it is about 18 feet in width, showing ore of good average quality. On the 7th station, from the old shaft, the main body of ore has been reached, which also exhibits fine ore, and between this point and the sixth level it is said 100 feet of ore have been developed. At the 2d station, Curtis shaft, 300 feet distant from the point at which the main body of ore was reached in the 7th level, the southeastern end of the same deposit, was cut during the past week. These developments, at a depth of 666 feet below the croppings, present a very favorable future for this company. It is estimated that the recent discoveries alone will supply their present reduction capacity for two years. They now employ seven mills which reduce about 200 tons of ore per day.

Crown Point advanced from previously quoted figures, selling at \$1,010, improving to \$1,070@1,060, and at the close \$1,080 is asked. The inclines continue in good ore, and the drift from the 400-foot station, it is thought, will soon reach the lode. During the week ending the 27th inst., 736 tons of ore were taken from the mine.

Yellow Jacket sold at \$630@639, advanced to \$675, buyer 30, receded to \$645, then rallied to \$665, and closed yesterday at \$660. We have no information from this mine of a later date than that given in our last issue—the 20th inst., owing to certain delinquencies of officials in Nevada.

Gould & Curry improved from \$430 to \$460, then advanced to \$550, and at the close we quote it at \$460. We learn that a few feet were sold at higher figures on the street. The prospects of this company, it is said, are more encouraging at this period than for some time past.

Imperial steadily rose from \$85, buyer 30, to \$98, closing yesterday at \$100. The Imperial and Empire shaft is now down 655 feet, and is well timbered for a distance of 648 feet. This shaft was commenced some ten months ago, and has now been completed in all respects to a depth of 600 feet, but from this point downwards only three compartments will be constructed at present. This shaft, when completed, will afford hoisting facilities for all the Gold Hill mines. It is to be continued, we learn, to a depth of 1,200 feet, and to work at that point, a sufficient power of machinery is now being supplied. The haulage receipts of this company for the month of October, aggregate \$98,380.

Empire Mill and Mining Company sold early in the week at \$97.50, advanced to \$120, and our quotations yesterday are \$125 asked. With the exception of a brief stoppage for repairs to machinery, everything is progressing well at the mines of this company.

Chollar-Potosi opened at \$100, advanced to \$117.50, buyer 15, then sold at \$111@115, rallied to \$122, and closed yesterday at \$118, s. 3. During the week ending October 28th, 631 tons of ore were forwarded to custom mills. The sinking of the new shaft is still progressing, but, it is said, nothing encouraging had been reached at the above date. This company now employs 95 men.

Ophir sold at \$85, buyer 10, early in the week, improved to \$90@97.50, receded to \$96, and yesterday \$90 was bid. We learn of nothing encouraging from this mine at latest dates.

Confidence was dealt in at \$52@58, declined to \$51, advanced to \$55, and at the close we quote it at \$55 bid. The annual meeting of this company will be held on Friday, the 9th instant, at their office, No. 415 Montgomery street.

Belcher advanced from \$55 to \$60, and yesterday sold at \$59 per share.... Daney sold at \$3.50.... Sierra Nevada improved from \$1 to \$3.

Overman changed hands within a range of \$8@16.50, closing yesterday at \$16½. Over 1,000 shares were sold in the Board during the week.... Bullion opened at \$14, then sold at \$12.50, and at the close we quote it at \$14 asked.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$266,168.

PITTSBURGH AND YUBA RIVER MINING COMPANY.—We have recently received the prospectus and hy-laws of this company. The mines of this corporation are at Smartsville, adjoining the famous Blue Gravel Company's claims. The company was incorporated by special act of the Pennsylvania Legislature, approved April 11, 1866. Its capital stock has been increased to \$500,000, "of which \$500,000 has been contributed and certificates of stock issued therefor." The prospectus speaks of the claims as "gulch deposits," i. e. gravel diggings. Following is a list of officers of the company: President, Geo. W. Cass; Treasurer, Wm. K. Hurt; Secretary, James Finlay; Board of Managers, Wm. Frew, W. W. Martin, J. H. Jones, Thomas Howard, C. W. Batchelor, M. K. Moorhead; General Manager, John Brickell, Smartsville, California.

SKATING CARS.—Some of our journals have been publishing in full a long account from the London Herald, of Monsieur Girard's "hydraulic" railroad. They say it has "attracted the attention of the scientific world," and that it is strange that such an extraordinary effort of genius has been suffered for four years to remain unappreciated. We have only to say, that this very fact is one of the most convincing proofs of its worthlessness. If anything were wanting to "cap the climax" of its absurdity, it may be found in the method of propulsion proposed by monsieur. We can go "aerial navigation" better than this.

HAT VENTILATOR.—Charles H. Coffin, of this city, has invented a new ventilator for hats, which has these two advantages: First, the outer plate is of silver, being therefore not liable to tarnish; and, second, it can be readily detached from the hat and applied to a new one.

The Marysville Appeal of Oct. 27th, says: Prof. Blake, of San Francisco, has recently visited the Brown's Valley mines, and examined the Pennsylvania and Jefferson claims. He expressed himself as most favorably impressed with the probable future of the mines of that district.

M. BOUTET, a French engineer, has suggested still another plan for connecting France with England. It is a bridge 22 miles long and 214 feet wide, with openings for ships and foot-paths for passengers on each side. The cost is estimated at eighty millions of dollars.

BELLAMI COAL.—We wish to call the attention of parties in the interior to the advertisement of this coal, which appears this week. It is a superior article of English smiths' coal, and is being used by many of the blacksmiths and some of the foundrymen of this city. It costs, we understand, only about one-half the price of Cumberland coal.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, NOV. 2, 1866.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent:

Per ton.	Per cent.	Per ton.	Per cent.
12	20	22	22
13	23	23	23
14	25	24	24
15	27	25	25
16	29	26	26
17	31	27	27
18	33	28	28
19	35	29	29
20	37	30	30
21	39	31	31
22	41	32	32
23	43	33	33
24	45	34	34
25	47	35	35
26	49	36	36
27	51	37	37
28	53	38	38
29	55	39	39
30	57	40	40
31	59	41	41
32	61	42	42
33	63	43	43
34	65	44	44
35	67	45	45
36	69	46	46
37	71	47	47
38	73	48	48
39	75	49	49
40	77	50	50
41	79	51	51
42	81	52	52
43	83	53	53
44	85	54	54
45	87	55	55
46	89	56	56
47	91	57	57
48	93	58	58
49	95	59	59
50	97	60	60

These prices, we believe, will be found substantially correct, and can be realized in this date.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & CO., Patent Agents.
San Francisco, May 1st, 1866.

MINING SHAREHOLDERS' DIRECTORY

[Compiled for every mine, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Metallurgists and Mining Engineers

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the Silver Mountain *Bulletin* of October 27th: The Mary Francis claim, which is supposed to be a northern extension of the George Washington, is being prosecuted with vigor by the owner, A. Carmichael. The tunnel commences near the head of Silver Creek, near Van Horn's mill, and will be one of the easiest claims to work cheaply in the district, as a water mill can be erected near the mouth of the tunnel, and the ores from the mine can be dumped from the car into the mill. James White has struck the ledge in the Extension, which is supposed to be a northern extension of Buckeye No. 1. The ores now being taken out exhibit ruby silver.

Brig. Gen. James F. Hall is daily expected in town, to take charge of the affairs of the Active company. It is expected that the mine will take a fresh start under the new management. The most prominent tunnel owned by this company is on the Constitution ledge, which, at this opening made upon it on Monitor Creek, reveals a ledge full twenty-five feet in width, containing the precious metals at the surface in sufficient quantities to warrant sinking, with the almost certain indication of striking an abundance of pay ore within one hundred feet of the surface.

The report of the committee to examine the books of the I. X. L. Co. is to the effect that the business has been conducted in a "culpably loose and careless manner." They recommend the removal of the office to Silver Mountain.

The mill of the Washington Co. is nearly completed, awaiting only the belting, water pipes and quicksilver. The ores from the Morning Star mine are to be worked at this mill, as well as those from the George Washington.

From the *Alpine Miner*, Oct. 27th: The American Tunnel and Silver Mining Company, having by a series of explorations determined the size, course and dip of their ledge, have now commenced a permanent working shaft about 100 feet east of the old works, which is expected to tap the ledge at a perpendicular depth of about 100 feet. It will be a double shaft, plank and timbered in the best manner, each compartment to be 4x4 in the clear. The engine, boiler and hoisting works are expected to arrive by the next steamer from New York. In the Washington, the work at the mill is up to time, and as we learn from good authority, if the balance of the supplies were here the works could be moving within five days.

Amador County—

From the *Ledger* of October 27th: At Enterprise, on Indian Creek, there are a number of claims which bid fair to turn out well when developed; among them are the following: The Pigeon Creek, owned by Aiken, Hinkson & Co. Depth of shaft 100 feet, and a fine foot ledge. The Phelps, owned by Phelps, thirty foot shaft and fair sized vein, and fine looking ore. The Enterprise, Rowley & Co., sixty-five foot shaft, six foot ledge, with fair prospects. The Spanish, a mine worked several years ago by Mexicans, is owned by Wilson, Kaul & Worden. A shaft was lately sunk to a depth of sixty-five feet, and we have seen but little better ore in the county. A fine specimen of it now before us is literally covered with gold, and is as fair a sample of the black gouge vein as can be found in the Eureka or Plymouth. The Jefferson has lately been opened at the head of Indian Creek. The ledge is four feet in width, and prospects fair for a first class mine. The Great Eastern has a twelve foot ledge, and shaft twenty-five feet. It is supposed to be on the Coney range, and prospects finely. The Greyhound, Gallner & George, is a fine ledge, with a splendid black gouge, and has turned out as handsome ribbon rock, well impregnated with auriferous sulphurets, as can be found in a day's ride. The ledge is six feet in width, and a shaft fifty feet in depth has been sunk on it. The Richmond company's mine is now yielding very good ore. The last run paid ten dollars per ton. The ledge on which the mine is located is the first west of that known as the Big Boulder, in the syenite belt. Their mill, the only one in that locality, is a fine 10-stamp one, driven by a hydraulic turbine wheel.

Meador & Co. having purchased the sulphuret mill formerly owned by S. S. Mannon, are now improving it, and will be working their sulphurets, of which they have a large amount, in a few weeks. The shaft on Wm. Roberts' claim, in Walker's field, half a mile north of Jackson, is now forty feet in depth, and the vein five feet wide. He is desirous of making arrangements with some party for its development.

Calaveras County—

The San Andreas *Register* has the follow-

ing in regard to the mining prospects in this county: We have in the southern portions, at Copperopolis, the rich copper mines, giving employment to 300 or 400 men. At Angels, six or eight miles east of Copperopolis, are extensive quartz mines, which are beginning to pay dividends, under the impetus given to the work by capitalists. There is a large section of country, extending four or five miles around Angel's, filled with gold-bearing quartz, waiting only capital to develop. In the vicinity of Murphy's and El Dorado, some six miles farther east, are some excellent quartz leads, known to be rich mineral. At West Point, situated at the extreme northeast portion of the county, are located some of the best paying quartz claims in this section. The rock at West Point is easily obtained, requiring less capital to open and work the mines than in other sections of the county. The returns being quick, and expense of working light, the miners are enabled to obtain remuneration for their labor without the aid of much capital. At Whisky Slide, Independence and Railroad Flat, intermediate places between West Point and Mokelumne Hill, have been discovered some good leads, on which the work of prospecting is going on. In the neighborhood of Mokelumne Hill more or less work is going on to open and develop the claims there. Near San Andreas are several leads of good quartz, which are of undoubted richness. But the want of capital is the great difficulty in the way of successfully working them. At Central Hill, along down the Calaveras river, at Jenny Lind, and near Mr. Bryant's on the Stockton road, are some very good placer and hill claims, several of which have been opened during the past summer.

Klamath County—

From the *Klamath News*: Mr. James Tonkin, of Salmou, an experienced copper miner, who has worked in the Lake Superior mines for many years, has visited the Caparrum mines, by request of some gentlemen interested in the "Klamath." His report is very favorable. He says that the existence of a ledge is beyond a doubt, but disapproves of the system of prospecting at present pursued. He recommends a tunnel on the Red Cap claim, which he thinks will strike the ledge at from 200 to 250 feet in depth. Mr. Tonkin is about to superintend the clearing out and repairing of the old drift on the Klamath claim, which he thinks is more likely to intersect the ledge than on which they have been lately working. Mr. H. J. Dart, of the Red Cap, is taking out rich ore, and the float ore in the Klamath is abundant and rich in quality.

Nevada County—

From the *Gazette*, Oct. 25th: The present owners of the Cornish, formerly the Ural, have continued their tunnel for a distance of 1,200 feet or more. The ledge where they are now working is of good size, and at a low calculation contains thirty per cent. of sulphurets, which by the chlorinizing process will yield not less than \$200 a ton. The ledge where it was worked above, was in some places six feet in width. A gentleman who visited the Ophir mine the other day informs us that it is yielding richer rock and more of it than ever before. The company now employ one hundred and twenty-five men in and about the mine.

Same of 26th: The steam hoisting and pumping works erected on the Mattingly ledge have been in operation some weeks, and the incline is now down about a hundred and twenty feet. The ledge at that depth is of good size, and contains a considerable quantity of rich sulphuret ore and some free gold. A Mr. Phillips has purchased the Ben Franklin ledge, near Willow Valley, for \$3,000. He leaves for Swansea by the next steamer, and will return in the spring with extensive machinery, which will be erected on the Ben Franklin.

Same of 27th: Arthur Hagadorn and others have traced the ledge on which is situated the Banker or Harpending mine, in a northerly direction for a distance of ten miles from where it has been opened by Harpending, where they have made a location of 2,000 feet. The ledge is visible in places the entire distance, and is some eighty feet in width where the location is made. The rock is a sort of slate, of different colors, containing considerable iron, and we are told shows fair prospect by ordinary crushing in a mortar. The ledge, or what at least is supposed to be the ledge, has now been traced a distance of nearly twenty miles, its course being north of west and south of east, about the direction of the main lodes in this county. Its northerly course will take it near Smartsville, in Yuba county.

Same of 30th: The new mill of Marcelus and Maltman, erected for crushing the gravel in the Manzanita diggings, was started up for regular work yesterday morning. It runs beautifully, and for effective work is not surpassed by any mill in the county of the same number of stamps. Being designed for crushing gravel, no poor or expensive amalgamating machinery are required. The motive power is a burly-gurdy wheel, sixty inches of water, with a head of 180 feet, being amply sufficient to run the fifteen stamps. The stamps weigh 650 pounds

each. The gold is amalgamated in the batteries, and on copper plates. They expect to run through from 80 to 100 tons of gravel in twenty-four hours. The machinery, timbers, and other materials for Pattee's mill, at Devil's Canon, Eureka township, are already on the ground, and the calculation is to have it running by the latter part of November.

Same of 31st: We learn that arrangements have been made for the erection of another quartz mill, this season, on Fall creek, in Washington township. The ledge on which the mill is to be built is owned by Marvin, Lindsey and others. The castings have been ordered from San Francisco, and are now on the way up. The mill is to be run by water power.

From the *Grass Valley National*: From present prospects the Ophir Hill Company expect to be taking out pay ore next week. The company owning Boston Ravine ledge, are now sinking an incline on their ledge, which is about one foot in width and shows well in free gold. On the Home Ticket ledge in Rich Ravine, the shaft is down only about eighteen feet; almost every particle of the dirt that has been taken out contains gold.

From the *Union* of October 25th: We learn from Mr. Wolfe that a Mr. Reeves struck a splendid looking ledge on Saturday last, about 2,000 feet north from the Spring Hill mine.

Same of 26th: From the Washington mine on Franklin Hill, fifty tons of quartz is now being hauled to the Allison Ranch mill, to be crushed. The ledge looks splendidly. We have lately seen some excellent rock from the Jim ledge, which is located about three miles from Eureka South, and owned by David B. Hunt and Sam. T. Curtis. The ledge varies from two to seven feet in width, is rich in free gold and sulphurets, and the rock now being taken out to crush, will, according to the opinion of experienced quartz miners, pay at the rate of \$150 per ton. Five tons of quartz from the Enterprise, the first southerly extension of the Mary Etta ledge, on Diamond creek, were crushed at the Gold Hill mill, in this place, during the present week, and the yield was \$24 per ton. A lot of the rock from the New York Hill mine is being crushed at the Rocky Bar mill. It is estimated that the entire lot will average \$60 a ton. In the lower level, which is down to a perpendicular depth of about one hundred and seventy-five feet, the vein varies from fifteen inches to three feet in width, and the ore looks splendidly. We are informed by one who knows, that \$15,000 worth of magnificent specimens have been taken from the Empire mine, on Ophir Hill, within the past few days. This Empire mill is now crushing a large lot of rock, which it is believed will average not less than \$160 per ton.

From the *Transcript*, Oct. 27th: The machinery for this mill which is to be erected upon the Jim ledge, at Eureka, arrived upon the ground on Wednesday, and the workmen have already commenced putting the mill up. The owners expect to have it ready to start in a very short time. A little more than two months ago, the Liberty and Exchequer companies located claims upon the same ledge, near Eureka. They commenced running tunnels, and at a distance of about 145 feet from the surface they tapped the ledge. They have one hundred feet backs. The ledge is found to be six feet wide.

EXCELSIOR.—From the *Meadow Lake Sun*, Oct. 27th: Nine and a half tons of rock from the Empire claim, crushed at the Winton mill, yielded \$106.99 in free gold. The sulphurets, amounting to about one ton, were saved, but have not been reduced. It is estimated that they will give \$50 to \$60 in addition. On last Monday we were shown a bar from the U. S. Grant mill, the product of about thirty tons of ore from the mine, worth \$2,043.

In the Excelsior mill, only a portion of the machinery is in operation. The results of the work, so far, may thus be summed up: 130 tons of rock crushed in five days; yielded \$15 per ton in free gold, \$1,950; sulphurets saved, first class from blankets, ten tons, worth \$75 per ton, \$750; second class from vats below blankets, fifteen tons, \$60 per ton, \$900; third class from shaking tables, twenty-five tons, \$45 per ton, \$1,125. Total, \$4,725.

Placer County—

The St. Lawrence claim, located near Ophir, is taking out some rich rock. Last week, Mr. E. W. Roberts, the Superintendent, brought up from the bottom of the 80-foot shaft a piece of quartz about a foot in length, which was literally covered with gold. A working test, made of rock taken out fifteen feet above this point, some three or four weeks since, showed \$39 to the ton.

From the *Stars and Stripes*, October 31st: The Stanford ledge is the name of a claim now being opened about one mile below town. A shaft has been sunk on it 28 feet, at which depth the vein is found to be 2½ feet wide, with solid granite casings. The rock prospects well in free gold, and is highly impregnated with sulphurets.

Plumas County—

From the *Quincy Union*, Oct. 27th: The mines on Hopkins' Creek are paying well. Betts & Co. are making from \$6 to \$8 per day in their tunnel on the South Fork of Hopkins' Creek. McManus & Co., at the Forks, are drifting under the old town, making from \$5 to \$7 a day per man. Dodge & Co., at Last Chance, are averaging half an ounce a day to the hand. Northman & Thomas cleared \$2,000 apiece, and sold their claims to James Cox, who has done equally as well in the adjoining claims. O'Neill & Co., at Hopkinsville, by sticking to their claims while others were running to Idaho and Montana, though \$3 or \$4 per day per man was the extent of their earnings, have made each a home-stake. On Nelson Creek, Ellerman & Co. are making from \$4 to \$5 a day in Nelson Creek, opposite High Bar. Murken, Stephens & Co. are taking out from \$30 to \$40 a week for every man employed. White & Richards, at Nelson Point, are still trying to get down to bed-rock. The North Star Company, whose claims are located on Blue Nose Mountain, near Hopkins' Creek, has just completed an air shaft 263 feet in height. Their tunnel is 1,800 feet in length, the last hundred feet of which is in gravel which prospects at the rate of \$1 to the car load, with occasionally a "chipsa" weighing from \$5 to \$15. On Pomeroy's Creek, Jim Gentry has finished cleaning up, and made a good summer's work, the yield of his claim netting nearly an ounce a day to the hand for all the work done. The claims of Martin & Bradley have been paying at the rate of \$10 a day for the last month. A. Turner, on the North Fork of Pomeroy's, is now sole proprietor of the old Linscott claims, to the extent of a thousand feet. The claim has been paying from \$7 to \$12 per day, all summer. Gibbons, Whiting & Co. have had excellent pay for the last four months. Their claims are considered the best on Pomeroy's Creek. Fifteen dollars per man has been the average yield for every day up to date. The Cariboo Company, on the North Fork, took out a nugget last week weighing twelve ounces. The Jaw Bone and the Morris companies taking the lead so far, and both are making from one ounce to \$20 a day to the man. The latter works day and night, employing about 20 men. Of the hill claims, Tripp & Cable have started work again in their tunnel below Jaw Bone, which paid so well last season. Loring & Wagoner continue to find their regular supply of nuggets, working six hands. Hickman's claim has paid also good wages, and so did Drake & Peck's.

From the *Plumas National*, Oct. 27th: On Saturday last, the Berge Mill Company, better known as the Bullfrog Company, struck in their ledge, near Rush creek, one of the richest chimneys of pay rock ever found in Plumas county.

Sacramento County—

From the *Folsom Telegraph*, Oct. 27th: Carr & Hillery last week cleaned up from their claim in Blue Ravine at Mormon Island, \$1,000 after three weeks' run, and wheeled the dirt some distance to their sluices. Milgate's claim at Wall's Diggings, is turning out rich quartz. He expects to have his mill in running order in a short time.

Santa Cruz County—

From the *Sentinel*, Oct. 27th: We are informed that a rich lead of copper ore has been discovered by Mr. Mish, which is reported as being richer than any heretofore worked in California. The ledge is situated about one mile southeast of the Forest House, near the stage road, on the northern slope of the high mountain known as the Loami Prieta spur. The parties owning the claim have formed a company, and will no doubt be incorporated, so as to thoroughly prospect the ledge. The ore resembles Copperopolis metal, and is easily worked.

Siskiyou County—

From the *Yreka Union* of October 27th: Quartz operations on Humbag are still going on with unusual liveliness, with fine prospects. The Shasta Butte company have commenced a tunnel, which is to be 312 feet long, striking the ledge about 150 feet from the surface. The Siskiyou company are sinking a shaft to a considerable depth, in preference to running a six hundred foot tunnel to strike their ledge.

Tulare County—

The Visalia *Delta* of October 24th says: A company of experienced prospectors have just gone out—properly outfitted by some of our business men—to thoroughly investigate the Western slope of this Sierra range, from the Kawiah to Kern River. We apprehend they will make discoveries of great interest to our valley.

Yuba County—

From the *Marysville Appeal*: We learn that the New York Mining company at Smartsville has, within a day or two, struck very rich pay dirt, equal to that of the Blue Gravel company. The 100-horse power steam engine, destined for the Pennsylvania Mining company, Brown's Valley, is now ready at the Marysville Foundry, and will be shipped

next Tuesday... The Blue Point Gravel Mining company filed its certificate of incorporation in the County Clerk's office yesterday (October 27). Location of claim—Sucker Flat, Empire Mining district, Yuba county. Office of company at Smartsville. Capital stock, \$112,000—224 shares, at \$500 each. Trustees: Lyman Ackley, R. L. Cray and J. Whalen.

The copper interest in this county has received fresh impetus by the resumption of work on the Emerald lead. There are at present some six or eight hands employed on this claim, and it is the intention of the proprietors, Messrs. Hardy & Jones, to prospect it thoroughly. The results produced by the expenditures heretofore made on this mine have been very encouraging.

NEVADA.

From the Gold Hill News of October 23d: We yesterday visited some of our Gold Hill mines—from the Imperial to the Crown Point, and without a single exception we found them all busy at work taking out pay ore. The dumps were well supplied with rock. The ore (with few exceptions) is from that portion of the ledge which lies between the first or upper levels and the surface. The lower levels of many of the mines are being worked but little at the present time, from the fact that the expense of hoisting out the water eats up much of the profits; and during the time they are taking out the surface ore the mammoth shaft of the Imperial and Empire companies has attained a depth of twelve hundred feet, completely draining all the mines of the Hill for a depth of four hundred feet deeper than the greatest depth yet attained. When this great work is completed, we expect to see as good ore taken from the lower levels of the Gold Hill mines as ever has been taken out in their most pulmy days.

Same of 24th: In the Kentucky mine the company are putting up extensive hoisting works. The building will be enclosed within five days, but the machinery will not be in running order for some time to come. The machinery consists of a 60-horse power engine, the cylinder being 16-inch bore, and having two feet stroke. Steam is supplied by two boilers, each of which is forty-five inches in diameter and fifteen feet long, and containing forty flues. The mine is at the present time taking out one hundred tons per day of a very superior class of ore.

The Phoenix Mill, below Silver City, was burned Oct. 20th. The Enterprise says that the mill destroyed contained 20 stamps, 36 pans, two boilers, engine, and all the other machinery usual in a quartz reduction mill, and it was owned by F. Berton, of the firm of Hentsch & Berton, San Francisco. It was a valuable mill, but had been lying idle for some time past. The fire was undoubtedly the work of an incendiary.

Reese River—

From the Reveille, October 16th: In Twin River District, the Murphy mine never looked half so well as it does now. The incline has been sunk to the depth of 90 feet, and good ore is being taken out all the time. In the lower drift, which has been run about 200 feet north from the incline, a body of mineral has been struck, which, it is estimated, will yield at least \$250 to the ton in the mill. A drift has also been run to the south, and there the ore is of a very high grade, being a heavy black sulphuret, assaying all the way from \$500 to \$1,000 per ton. In a few feet more the drift will reach the dividing line between the Murphy and McDonald locations, and the owners of the latter will necessarily be benefited by these recent developments. The amount of milling ore now on the dump is not less than a thousand tons, and though it has been very imperfectly assorted, it can scarcely fail to yield from \$100 to \$150 per ton by mill process. The fine twenty-stamp mill just erected by the Twin River Mining Company, who own the Murphy and several parallel ledges, is ready to start operations.

Same of 22d: Robert Morrill and a party of workmen left town this morning for Silver Bend, for the purpose of working the Silver Champion ledge. A house, with provisions and tools, was dispatched to the district on Friday. Passengers are now carried from Austin to Belmont, in the Silver Bend district, in twenty hours, and to Hot Creek in thirty hours.

Same of 23d: We learn that twelve tons of ore from the Camargo mine in Marshall Canon have just been reduced at the Keystone mill. The ore yielded at the rate of \$120 per ton, and produced bullion 784 flue. It was worked up to 84½ per cent. of the pulp assay.

The following is from a communication on the geology of Mount Prometheus, Reese River District: "I believe that the richest deposits of silver that will ever be discovered in this State, and the most extensive, will be found in this district when a sufficient depth has been reached, for every vein thus far developed indicates it. Other districts may have

larger veins and exhibit massive croppings, but the greatest proportion of silver will be found where the fissure veins are narrow and frequent, and the metal concentrated. Large chambers of the precious ore may be looked for at the proper depth below the crust or upper formation in this district the same as it is found in different parts of Mexico; and it is my candid opinion that a depth not to exceed one thousand feet will, when exposed, reveal us handsome and equally massive specimens of native silver as now adorn the niches of the cathedral in San Luis Potosi, taken from the mines in the vicinity of that place."

From the Nye County News, Oct. 13: Mr. Newton Williams, of Summit Canon, North Twin River district, laid upon our table some fine ore from that district, from the Canada and Highland Maid ledges. These ledges are on the same belt with the famous Buckeye claim, and promise well. Work is going ahead on the Buckeye, which is constantly improving, and it is the intention to thoroughly develop this ledge before proceeding to put up a mill, though present appearances would seem to warrant its immediate construction. Business is reported as being quite lively in that section.

Following is the return of bullion-producing mines in Lander county for the quarter ending 30th September, as compiled from the books of C. O. Burder, County Assessor. It will be observed that in several instances ore was brought here from districts in Nye county for reduction, and they are marked thus: Philadelphia, Danville, and Northumberland. The average yield per ton, as well as the production of the Savage mine, is lower than the preceding quarters, owing to the fact that they have been opening new levels in the direction of the deposit of richest ore, which they are now extracting, and which will augment the production and average value for the present quarter:

Emeralda—

From the Esmeralda Union of October 23d: The shaft of the Philadelphia company has reached a depth of about two hundred and sixty feet, and is being pushed ahead as rapidly as possible. The rock is hard now, and the large volume of water rushing into the shaft interferes considerably with the work, but this obstacle will soon be overcome by putting in a large pump.

Humboldt County—

From the Register of October 20th: The Pioneer mill has suspended active work for the present; not doing custom work, but running on tailings. The occasion is—a necessary enlargement of the reservoir for tailings. Rock will be taken, meantime, and worked in its order as soon as this enlargement has been completed—some two weeks hence. McCormick, just up from Oreana, informs us that the smelting furnaces are in full blast, and turning out cords of bullion from Montezuma ore.

Pahranaagat—

From the Salt Lake Vedette of October 18th: We were recently shown, by His Excellency, Governor Durkee, who has lately returned from Pahranaagat Silver Mining district, two shining silver lumps which were got from less than half a ton of ore by Mr. Mills, from the Green Monster ledge, partly owned by a New York company. One of these bullion chunks weighed forty ounces. It contained about four ounces of gold. The Governor is satisfied that the Pahranaagat country, be it in southwestern Utah or southeastern Nevada, as the case may be, is one of the very richest mining areas in the West, and will so prove to be before many seasons hence. Much industry and mining enterprise is being exhibited there this fall, and a large amount of capital is coming thither from the East.

IDAHO.

From the Idaho World, Oct. 13th: We are told that a party of five have lately found good diggings on Slaughter House gulch, on

Elk creek, opposite this city. On Thursday we were shown a silver bar, made from ore taken from the Banner ledge, on Moore's creek, about seven miles above here, which weighs eighty ounces and is worth \$202.38. It is the product of thirteen tons of the first rock, taken from the ledge. The assay shows a remarkable fineness, viz.: gold, 64 fine; silver, 926 fine, being nearly pure. A party returned from the Green River country, report having found a valley sixty miles in extent, in which some prospects were found, but the diggings are not likely to prove rich. They proposed to return in the spring and prospect further. We were yesterday shown a piece of rock, weighing about twenty pounds, taken from a depth of sixty-four feet in the Garrison Gambinus ledge, which was speckled all through with gold. This ledge and the old Gambinus ledge, together with the first eastern extension of the latter, are now owned by S. G. Rosenbaum, and his purposes removing this mill now at work on his Juniata ledge close by, to the old Gambinus house next week. F. F. Marx has bought the Van Wyck quartz mill, lately located near Centerville, which he will have immediately taken to the Napoleon Hill Company's ledge in Alturas, of which he is chief owner.

From the Avalanche Oct. 20th: The Minear mill is to be started during the coming week by McMillan Bros. on rock from the south extension of the Empire ledge. The miners formerly employed on the Oro Fino mine have obtained judgments to the aggregate amount of \$21,891.57 in suits commenced under the lien law, and against More & Focus' interests in said mine. Judgment was confessed in open court. The Trustees of the Oro Fino and Morning Star Mining Company met and revoked the power given to J. M. More to sell their property. Cause, apparent bad faith on the part of More towards the company. All the liens against the Shoenbar mill were allowed and judgment and order of sale decreed. To the ledge discovered on War Eagle mountain by Geo. Vass and others, has been given the name of "Woodstock." It is forty feet west of the Empire ledge, and parallel with it, and about 300 feet southeast of the original Poorman discovery. The ledge is opened up to a depth of twelve feet, is fifteen inches wide and well defined. A specimen of several pounds weight, left at our office on Wednesday, shows much free gold and black sulphurets of silver equal in richness to much of the Poorman.

From the Statesman Oct. 13th: Three men, named Abner, Webster and Chase, have been prospecting on Green river since July. Their clothes and provisions giving out, they were obliged to leave. As to their prospects, they report having found a high table land extending some sixty miles in length by from five to twelve in width, covered with drift gravel from three to twelve feet in depth. They prospected in many places, always finding what they deemed a good prospect of very fine gold. The deepest hole they sunk was fourteen feet. This is situated on a tributary of Green river, called La Barge. Water is abundant, and the extent of ground that affords this prospect is very great. The gold, they say, seems to be generally diffused through the gravel, which is not coarse, wherever they prospected. Though extremely fine and difficult to save, they are fully convinced that with the aid of quicksilver and copper, good wages can be made over a very large extent of country.

Same of 20th: We find from the returns in the Revenue Assessor's office, that two assay offices in Owyhee county have made the following returns for the month of September of gold and silver bullion assayed by them:

Blake & Co.....	\$121,355 39
King, Webb & Co.....	92,065 53
Total.....	\$213,421 22

The above is the value in gold coin, but since our Eastern exchanges won't understand how much that is, we will make the statement over again for their benefit in currency at 75 cents, and it will then be:

Blake & Co.....	\$162,473 85
King, Webb & Co.....	122,794 44
Total.....	\$285,268 29

Owyhee will yet turn out a hundred times as much bullion as that in one month. It should be mentioned that this return is made for the first month after the close of the Morning Star and Oro Fino mines, so the amount is not so large by sixty or eighty thousand as it would be if those mines had been yielding.

MONTANA.

From the Post, Oct. 13th: Gaston, Simpson & Co.'s mill in New York district, cleaned up \$1,700 on last Thursday, out of thirty five tons of ore, in five days run. Sweeney & Co. cleaned up last Saturday, \$1,750, the reward of a week's run, with a single shift, on Banner Dan's bar. A new discovery of gold was made last week in Brown's gulch, about five miles from Virginia City. Nuggets weighing eleven dollars have been found, and the gold is coarse and in encouraging quantities. A district was organized yesterday.

Helena correspondence: The Ten Mile ditch

has been pushed forward vigorously during the past week, but it is very doubtful, to say the least, whether it will be completed this fall. There is a great deal of work still to be done on it: among other things a tunnel of over fifty yards through the hill west of town, which is about half completed, and fluming without limit. The miners in Lower Last Chance are having a better supply of water than formerly, and are consequently seeing better times. The work which has been done there during the past two or three weeks has materially changed the appearance of the ground.

Bannack letter: The St. Louis Company are smelting fifteen tons of ore per day at Rattlesnake; Prof. Eaton's blasting furnace is about ready for full operation; The Butterfield mill is making good weekly returns; The Bannack Ditch and Mining Company are taking out over a thousand dollars per week; Messrs. Kirby & Clarke will have the largest mill in the Territory running in a few weeks; and hundreds of tons of rich gold ore ready, besides furnaces which will be put up next year.

WASHINGTON.

A gentleman returned from Colville says that quite an excitement existed in that place at the time he left, in regard to some very extensive mining ground just discovered on Arrow Lake, about half way between Colville and the Big Bend country. Nearly the whole population of Colville stampeded for the new diggings. About five miles of country has been prospected over, and Mr. O'Donald was assured that from ten cents to six hits to the pan was easily obtained. The steamer "49," Capt. Lea, White, runs past the new diggings, en route to the Big Bend mines. Mr. O'Donald brought quite a lot of this dust with him, and it is pronounced to be worth \$18 per ounce; the dust resembles Mormon Gulch gold of California.

COLORADO.

From the Journal Oct. 9th: The Smith & Parmelee Company retorted 356 ounces of gold last evening—a single week's run, and worth \$8,496. Work stopped on the Consolidated Gregory, on Tuesday. Mr. Myers of South Clear Creek, Spanish Bar, is soon going to start his mill, Crosby & Thompson, stamps for crushing dry. Mr. Morgan is getting out very fine ore from the Susquehanna Company's mine on the German. It is copper and iron pyrites, and quite rich in bullion. Mr. Smith of Trail Run has been running some of his Freeland ore through Bertola pans at the Bullion Company's mill, getting about an ounce of gold to the ton. The snow has mostly gone off at Argentine and Quail Creek and business up there is being pressed forward with the greatest energy. At the office of the Turks may be seen splendid specimens of ore taken from the Richmond by Hasbrouck & Co. Mr. Lee thinks that in a few weeks the Gregory and Bobtail mines will be in condition to furnish the company's eighty stamps with ore, and that then he will be taking out \$10,000 a week.

From the Denver News Oct. 10th: By a private letter from Montgomery, we learn that the Pioneer Gold Mining Company started their works last week, and have fifteen stamps running. The other fifteen are to be put in the mill soon. The machinery all works to a charm, and it is the intention of the company to keep the mill running right along. Hon. Geo. F. Mitchell, superintendent of the Alps Mining Company, reports affairs as prospering.

From the Register: Reports from the silver mines are excellent. Not a day passes but new discoveries are reported and extremely rich specimens are shown. The Baker lode at Argentine, owned by Mr. Watson, together with parties in Philadelphia, is producing far richer ores than was expected. A considerable portion of them are sulphides of silver. The crevice is wide and still improving. Mr. Watson has his road almost completed. His furnace will be ready to commence smelting this week, as well as his cupelling furnace. Work is being driven on something like a dozen lodes at Argentine. At Snake river the prospect is extremely flattering. Yesterday we were shown by Mr. Blackman, specimens from the Esmeralda lode, situated on Collier mountain. They consisted of white quartz mixed with chloride and sulphide silver, assaying over two thousand dollars per ton in silver. The crevice from which they came, is ten feet wide and still increasing. Other lodes equally well. Silver mines have also been discovered on Chicago creek and Beaver creek on the south, and on James and other creeks on the north.

UTAH.

From the Vedette Oct. 18th: The latest news from the Stockton mines is of the most favorable character. The large reverberatory furnace of Jas. Finnerty was to have been running by this time. Mr. Gibson's furnace is turning out metal daily, and Monheim & Johnson have a large water power smelter, which started upon the 11th. Chase & Yoachum, have also constructed a new furnace, which was to have been started yesterday.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 23, 1866.

Mr. O. P. Truesdell will act as our Corresponding Agent and Solicitor in the interior of this State, from this date. August 23, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. SAN FRANCISCO, Jan 11th, 1866.

San Francisco:

Saturday Morning, Nov. 3, 1866.

NOTICES TO CORRESPONDENTS.

OWING to the large amount of correspondence received relating to interesting points connected with Mining, Metallurgy, Mechanics, etc., we are compelled, for want of time and space, to reply briefly in the following form to a portion of such queries as are of general interest.

W. J. BEGGS, AUBURN—STEATITE, OR SOAPSTONE AND FIRE CLAY.—It would be very difficult to give a correct opinion as to the value of a large deposit of soapstone, even though of the best quality. This substance is found tolerably abundant throughout the State, whilst the local consumption so far has been limited. It is doubtful, therefore, whether our domestic consumption would justify any great outlay in developing a mine or quarry of this material. If, however, obtainable in large blocks, or in flags of considerable area, it is possible a foreign demand might arise, if the carriage to the seaboard is not too great. Respecting fire clay, there can be no doubt that if really such, of easy access and of sufficient quantity, that the ledge will prove a valuable one—as the consumption hitherto may be deemed rather as embryonic, scarcely being entitled to that of infantile. It is quite probable, however, that it will be necessary for the locators to test the quality of the clay by first making a batch of bricks, before the public will accept the statement as being true.

J. M. B., SACRAMENTO—BABBIT METAL is composed of tin, antimony and copper, in proportions as described in his patent, which, we believe, has not yet expired, or if expired, it can only be recently. Directions: Melt 4 lbs. copper; add by degrees 12 lbs. best quality of tin, 8 lbs. regulus (metallic) antimony, and add 12 lbs. additional tin while the previous named metals are in a fused form. After the copper is melted, and 4 or 5 lbs. of tin has been added, the heat should be reduced to a dull red to prevent oxidation, and then add the remainder of the metal as above.

L. S., BUTTE COUNTY.—TRAP is a generic term commonly used to designate every variety of plutonic rock of an amorphous character which distinctly varies from the granitic and cognate varieties. It is sometimes called compact basalt when of a deep black color, greenstone when of a deep bottle-green color. Both of these are called basalt when found in a columnar form. As a usual thing, the term trap is now most commonly confined to compact igneous rocks, possessing a deep brown or reddish color, this color prevailing even when they are penetrated to a considerable depth.

T. P., LOS ANGELES—TIN ORE.—From any specimens hitherto exhibited to us, we have strong doubts whether your vicinity will probably yield in future even a reasonable amount of pure or sufficiently pure oxyd of tin so as to be commercially available. Tin, like lead ore, has to be dressed to a high percentage of metal, prior to being reduced by the furnace; otherwise the sand present will form a heavy silicated slag, which will absorb a large portion of the metal. Another reason has considerable weight with us. In all countries where tin has heretofore been found in any considerable quantity in veins, the adjoining country has been more or less covered with stream or placer tin deposits, just as gold placers are indicative of contiguous gold veins. What few unbroken specimens of tin ore we have seen from your neighborhood, really contained very little tin, the ore being chiefly composed of mixtures of wolfram, oxyd of iron, and schorl, from which it would be difficult, by any known methods, to economically separate the tin ore. Dr. C. T. Jackson was of opinion, from analyzing one specimen, that the tin was originally a double sulphide of tin and copper or bell metal ore. A mine that would yield such an ore in quantity, would be very valuable, and would be worth going to some expense in prospecting. Such an ore would be peculiarly well adapted for making Babbit metal, alluded to above, and similar alloys.

AGUADO, LOWER CALIFORNIA.—We are afraid that all the modes hitherto adopted for producing copper in the metallic state from ordinary copper ores by aqueous means, will be found impracticable in your position. A cheap and easy way of reducing copper from its ores by the bannid method is very desirable, especially when fuel is scarce and expensive.

PROGRESS IN IRON AND STEEL MANUFACTURE.

The last number of the *London Quarterly* contains a review of the second volume of Dr. Percy's Metallurgy. This volume is set apart especially for the subject named at the head of our article. Dr. P. is a Fellow of the Royal Society, and has made this specialty his study for many years. The book is spoken of as a most elaborate and admirable work. The subject is an intensely interesting one. No other metal is so important or so various in its uses. This extraordinary variety is due to its property of entering into combination with carbon in varying proportions, and under different circumstances. Dr. Percy says: "The influence of this element in causing variation in the physical properties of iron, is one of the most extraordinary phenomena in the whole range of metallurgy. Under the common name of iron, are included virtually distinct metals, which in external characters differ far more from each other than many chemically distinct metals." The difference between the ductile wrought iron, the elastic steel, susceptible of receiving very different degrees of hardness by tempering, and the hard, brittle and *unforgeable* cast iron, depends upon the difference in the proportion of carbon, "though other elements often concur in modifying in a striking degree the qualities of this wonderful metal."

It would be extremely interesting to follow the various steps of progress in the art of working iron; but our limits permit us barely to touch upon the most notable ones. The ancient Egyptians were familiar with the use of iron, as is shown by nails in the inner doors of Theban tombs, which could not have been opened for at least 2,000 years. The Assyrians, too, manufactured saws and knives of iron, specimens of which, now in the British Museum, were found by Mr. Layard in Nineveh. The Hindoos, the natives of Madagascar and those of Central Africa, all manufactured iron. Their rude methods have before been alluded to in our journal. The first iron manufactured was probably malleable iron, highly carbonized in consequence of the manner of its production. Dr. Livingstone says that the African tribes on the Zambesi consider the English iron "rotten." A Birmingham blacksmith chilled a specimen of iron made by these people, and found that it was then steel. Du Chailu says the Fans will not use American, or English iron in making their knives and arrow heads, but prefer their own, which has greater tenacity.

The making of articles of cast iron commenced in England about four hundred years ago, in Sussex. Everything was done by means of charcoal. As the manufacture increased, the woods of Sussex became unable to meet the demand. It was even proposed that all iron work should be put down, as threatening the community with the entire loss of fuel.

Then followed many attempts to employ mineral coal. Most of these failed. In 1735, Abraham Darby, of Shropshire, succeeded in solving the problem. He converted it into coke, by treating it as charcoal-burners treat wood, and in this form proceeded to experiment upon it as a substitute for charcoal. With the utmost solicitude he watched his furnace for six days and nights, leaving it neither to eat or sleep. On the sixth evening he had the satisfaction of seeing the iron run out well, and sank down exhausted. From that time his success was rapid.

Next came the "puddling" process, for reducing cast or pig-iron to malleable iron, usually ascribed to Henry Cort, about 1785. The discovery of the "Black-band" ironstone, near Glasgow, Scotland, by David Musbet, in 1801, followed. This is an inferior but very abundant ore. The next step was the invention of the hot blast, by James B. Neilson, in 1828. Strange as it may seem, the efforts of furnacemen had been previously directed to the *cooling* of the blast, under the impression that the best iron was thus made. In some cases the air pipes were even enrouned with ice to secure this end. Neilson's proposal to blow hot air into the furnace,

with the view of intensifying the heat and economizing fuel, was laughed at. At last he succeeded in getting an opportunity to try the experiment. The result was so satisfactory that the value of the process was at once recognized, and it soon became generally adopted. The saving of fuel is more than one-third. The profitable working of inferior ore was thus secured. In 1828, the year in which Neilson took out his patent, the total product of the Scotch mines was 29,000 tons of pig-iron. It now exceeds a million.

We come now to the great discovery of the day in this direction, viz: Mr. Bessemer's process for the direct conversion of pig-iron into steel. The methods for producing steel in modern times are described by Dr. Percy under three general heads, viz: by the addition of carbon to malleable iron, the partial decarburization of cast iron, and the addition of malleable to cast iron. There are various processes for accomplishing each of these ends, into the details of which we cannot enter. Most of them involve great nicety of manipulation, and the results are by no means uniform.

At the time when Mr. Bessemer commenced his experiments, one of the great problems which exercised the minds of inventors was the discovery of some stronger material than cast iron for large guns. It was while occupied with this subject that the idea occurred to Mr. B. of *blowing air through melted pig-iron*; thus—instead of bringing the particles of iron in turn into contact with the air, as is done in the puddling operation—forcing the air into contact with the separated particles of iron. In 1856 he set up a cupola furnace for the trial. Five tuyere pipes, three-eighths of an inch in diameter, entered it near the bottom. The experiment was a hazardous one. The blast was turned on, and the melted iron was poured through the charging hole. The commotion that took place was most extraordinary; the melted iron dashed from side to side of the vessel; flames shot up from the mouth of the furnace, bearing large masses of slag. A heavy cast iron plate suspended over the top dissolved in mist, together with several yards of the chain by which it hung. No one durst approach to turn off the air. Affairs became alarming, and the fire engines were sent for; but before they arrived, "the fury of decarburization had expended itself, and the product was run off."

The result was sufficiently satisfactory to induce Mr. B. to continue his experiments. It was soon found that by interrupting the process before decarburization was complete, the product was *steel*, and of good quality. But it was found, in practice, that the difficulty was to interrupt the process just at the right time to produce the kind of steel which might be desired. In consequence the discovery began to be neglected, and after a time was considered by many to be a total failure. Mr. Bessemer, satisfied that the principle upon which he had proceeded was the correct one, set himself to work to remedy the defect in his process. Several years were spent in further experimentation. At last he hit upon the plan of first completing the decarburization, and then introducing a quantity of fluid carburet of iron containing the exact measure of carbon required for the iron or steel to be produced. The thing was done; but now the question was, how to introduce again the process which had fallen into disfavor. No one would meddle with it. He had but one alternative—to abandon the invention altogether, or to turn steel manufacturer himself. He adopted the latter course, and has now for some years carried on extensive operations in Sheffield. The great value of his invention is now duly acknowledged. The average price of the steel so manufactured is at least one hundred dollars per ton less than the previous average price.

Probably the most important use of the Bessemer steel is for railway purposes. As the weight of the locomotives manufactured has increased, the strength and hardness of the material used for rails ought to have increased in the same proportion. But this has

not been the case. The wear and tear of rails has been enormous. The cost of the maintaining and renewal of track on the Great Northern Railway has increased, during the last fourteen years, more than 200 per cent. Experiments have therefore been instituted within the last few years to determine the fitness of steel for this purpose. At a certain point on the London and Northwestern Railway, where many tracks converge, and where, owing to the constant stopping, backing, and making up of trains, the wear was so great that the rails were ground to pieces in two months, two steel rails were laid down precisely opposite to two new iron rails of the best quality, in such a manner as to be subjected to precisely the same wear. When the iron rails were worn down as far as safety would allow, they were turned, and the lower faces worn out in the same manner. They were then replaced by new rails. Three years and four months afterwards the steel rails were found to have worn down evenly about a quarter of an inch. During that time eight iron rails had been worn out on both faces!

Steel rails are now in use on several roads in England, and the same material is being adopted for oxles and wheel-tires. Our own people are beginning to follow suit; and 10,000 tons of Bessemer steel has been ordered from a single Sheffield firm, for the use of different railroads in the United States. The *United States Railroad Register* of September 29th, says, "the Lehigh Canal Company have contracted for steel rails for forty-eight miles of their progressing railroad. The rail will weigh fifty-six pounds per yard, and be wholly of Bessemer steel."

Mr. Robert Mushet, the son of the discoverer of the black-band iron stone of which we have spoken, recently read a paper before the British Association, in which he claims that his father took the first step in the "pneumatic" or Bessemer process, in 1815, inasmuch as he took out a patent for the manufacture of refined iron direct from the blast furnace. He admits, however, that the maintaining a tuyere beneath a column of melted iron was Mr. Bessemer's own idea, and that Mr. B. is therefore entitled to the credit of having made the first great advance towards making steel as cheap as iron. But he claims that he saw, at an early date, that as iron exposed in a melted state to the action of oxygen became debased, by being made "burnt iron," or as Mr. Mushet calls it, "oxygenated iron," some metal must be added during the process which has a greater affinity than iron for oxygen. He therefore experimented with manganese, in the form of "spiegeleisen," and successfully. A patent was granted him in 1856. But in 1859 this patent "lapsed" through non-payment of the stamp duty of £50, owing to some oversight of the trustees to whom he had entrusted his patent right. He thinks that his invention, in reality, gave to the Bessemer process its chief value; and thinks it hard, that through such an accident, he should lose the benefit of it, and Mr. Bessemer be allowed to use it without the payment of a royalty.

We quote a few of the last words of the paper:

"The pneumatic process of Mr. Bessemer, in conjunction with my spiegeleisen process, is producing a revolution in the engineering world, and in all the departments of art dependent upon engineering, to an extent almost incredible, and the magnitude of its ultimate effect it is impossible fully to foresee. Mr. Bessemer's name will be remembered in connection with this, the greatest metallurgical invention the world has ever seen; and I venture to hope that I may not be wholly forgotten as having supplied the link which was wanting to render Mr. Bessemer's process what it now is."

This interesting subject may again be taken up by us.

THE TOUR TO PAHRANAGAT.—At the College Hall, Oakland, on Monday evening last, Rev. Mr. White, of Carson City, delivered a very good narration of the recent journey of Gov. Blasdell and party to Pahrnagat. His description of Mono Lake and Death Valley was full of interest and information.

PETROLEUM.—Thirty-two cans of oil recently arrived in this city from the works of the Buena Vista Company, Tulare county.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

BLOW PIPE.—Josiah McFarland, Clinton, Ill.: This invention consists in applying an air chamber to a force pump, and to a flexible pipe with a fine pointed mouth-piece, in such a way that by means of the pump the chamber is filled with compressed air or gas of any character, when, by closing suitable cocks, the same can be confined and retained therein and the air chamber taken off and carried to the place where the blow pipe is to be used, and by the action of the air or gas a powerful blast obtained without the labor or agency of the operator.

SAFETY POCKET.—Jas. T. Chambers, Utica, N. Y.: This invention consists in so constructing a pocket, that a watch or any other article placed in it cannot be abstracted or removed without the knowledge of the possessor or wearer.

SAW MILL.—George W. Coddington, Middletown, Ohio: This invention has for its object to furnish an apparatus for supporting the middle part of the log while being sawed, so that it may be prevented from bouncing and jumping, enabling the saw to be run at full speed from one end of the log to the other, without its being necessary to check the speed of the saw, or alter or take off the feed when approaching the middle of the log or carriage, as is now the case.

MOLDER'S FLASK.—E. C. Little: This improvement consists in a cast iron frame for molder's flasks, constructed with hinges and pins peculiarly fitted for connecting the cups and drags so that they are adapted to a match-plate, without producing any lateral movement to disturb the pattern.

CORN HARVESTER.—S. Sechrist: This invention is designed as a labor-saving implement for cutting and gathering Indian corn and sugar-cane, and leaving the stalks standing in shocks as the machine travels over the field, making clean and expeditious work.

COMPOSITION ROOFING.—James G. Holliday, Wheeling, W. Va.: This invention consists of a composition roofing, formed for combining coal tar, still bottom of petroleum, acid tar, finely ground brick clay, and refuse lime from gas house, with each other.

RECENT INVENTIONS.

STOP-MOTION FOR SPINNING MACHINES.—Lewis Cutting, San Francisco, Cal.: I claim the bar, J, and slide, N, combined and operating substantially as and for the purposes described.

UMBRELLA.—Wm. Damerel, Brooklyn, N. Y.: I claim an umbrella held closed or shut by means of an elastic band placed around the stretchers of their frames, substantially as shown and described. I also claim rests, F, as arranged for holding the band or string, E, in its proper place, on or over the stretchers of an umbrella in all conditions, whether closed or extended, substantially as described.

RESPIRATOR.—Theodore A. Hoffman, Beardstown, Ill.: I claim the gauze, B, inclosed cotton, C, covering, F, and elastic strap, E, combined and provided with the elastic strap, D, and operating substantially as described for the purpose specified.

PEAS-SHELLER.—George T. Savay, Groveland, Mass.: I claim combining the roller of a machine, as described, by the employment of a ring of vulcanized rubber or other elastic or suitable material under such an arrangement that while motion is communicated from one roll to the other by friction of contact, there shall also be a sufficient space between the two rolls to effect the shelling of the peas, as herein set forth and described.

NEEDLE-THREADER.—Charles L. Spencer, Providence, R. I.: I claim a needle-threader, the threading channel of which is divisible, all substantially as described.

AMALGAMATOR.—S. Frederick Charles, assignor to himself and J. E. Russell, Dahlonega, Ga.: I claim, 1st, The so combining a panning machine, a regrounding machine, and an amalgamator that the gold shall be thoroughly extracted by the continuous action of all of them, substantially as set forth. 2d, The adjustable partition, B, constructed and operated substantially and for the purposes set forth. 3d, The deep radiating channels, j, in the lower surface of the grinder, K. 4th, The combination of an upper revolving grinder with an oscillating lower one, constructed and operating substantially as specified. 5th, The case or shell, M, of the grinders, in combination with the rollers, I, and the reciprocating arm or lever, O. 6th, The amalgamator, R, so constructed as to form one large and one narrow compartment by the insertion of the removable and adjustable partition, o, sub-

stantially as specified. 7th, The revolving frame, provided with amalgamating pans, suspended below the surface of the voracious mounds, constructed and operating substantially as and for the purposes specified. 8th, The location of the flue below the series of amalgamators, substantially as and for the purposes specified.

PATENTS can be obtained for citizens on this Coast through the Mining and Scientific Press Patent Agency. In one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California Inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE.

DEWEY & CO.,
Patent Agents, 505 Clay street, San Francisco.

LIST OF OFFICERS OF CORPORATIONS AND MINING COMPANIES.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

[Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every Mining Company is invited to send us the result of their election, to be put on record, gratuitously, with any other facts of general interest.]

CHAMPION M. Co.—October 8th. Trustees: R. Roxby, F. Roeding, G. H. Howard, R. Smith, F. Sievers, J. Mosheimer, F. E. Lynch. President, R. Roxby; Secretary, J. F. Lohsa; Treasurer, A. Gausl; Superintendent, E. C. Fogg.

ENTERPRISE G. & S. M. Co.—Meadow Lake District. October 17th. Trustees: A. De Land, E. B. Mott, Jr., C. W. Young, Wm. B. May, Joseph Da Bell. President, A. De Land; Secretary, Joseph Da Bell; Treasurer, Wm. B. May.

GREAT CENTRAL M. Co.—October 8th. Trustees: A. S. Evans, S. S. Tilton, E. H. Washburn, Nathaniel Page, Wm. Thompson, John R. Mason, James Brokaw. President, A. S. Evans; Secretary and Treasurer, O. D. Squire; Superintendent, Wm. Thompson.

LA BLANCA S. M. Co.—October 9th. Trustees: D. Dwyer, E. Wertheimer, H. Engelbrecht, H. Newman, G. D. Heldebrandt. President, D. Dwyer; Secretary, E. Goldman; Treasurer, E. Wertheimer; Superintendent, F. Hartman.

EL TASTE S. M. Co.—October 16th. Trustees: J. B. Roberts, J. R. Mead, A. F. Sawyer, C. Wittrah, F. Wittrah, J. N. McCue, F. McCrellish.

RECENT INCORPORATIONS.

MONTEREY Q. S. M. Co.—Monterey Co. Capital stock, \$400,000; 4,000 shares; \$100 per share. Trustees: Theo. L. Rose, Charles Mayne, Calvin Puige, John Nightingale, L. S. Robinson. October 27.

PEACOCK C. N. & C. M. Co.—Meadow Lake Mining District, Nevada county. Capital stock, \$675,000; 2,700 shares; \$250 per share. Trustees: Rollins C. Gaskell, Frederick F. Low, John F. Miller, Andrew J. Snyder, Geo. G. Gorham, Benj. B. Redding, Geo. Howland. October 23.

MOUNTAIN HONE WATER CO.—San Mateo county and vicinity. Capital stock, \$500,000; 5,000 shares; \$100 per share. Trustees: J. J. Felt, William Norris, William Pierce. October 2.

WATSON G. & S. M. Co.—Devil's Gate Mining District, Lyon county, Nevada. Capital stock, \$280,000; 1,400 shares; \$200 per share. Trustees: Henry Schwartz, J. Chahouna, S. B. Watson, Geo. A. Parker, M. Adler. October 6.

TEXAS FLAT M. Co.—Fresno county. Capital stock, \$715,000; 7,150 shares; \$100 per share. Trustees: Geo. Hearst, Wm. Shear, John Moss, Wm. M. Lent, Geo. B. McAneny. October 9.

ODD FELLOWS' SAVINGS BANK.—San Francisco. Directors: Chas. Langley, Henry B. Brooks, Henry J. Booth, John A. McClelland, Abram Block, Moses Selig, Chas. Bernard, Cutler McAllister, Philo White, David Hunter, Newton Booth, John F. Miller, John Cammet, Chas. Metzler, Martin Heller, Chas. N. Fox, Daniel McLaren, Fred. Fortmann, Joseph Brandenstein, Wm. A. Woodward, David Meeker, Aaron A. Sargent, Wm. Jones. October 13.

QUAIL HILL CANAL CO.—Calaveras county. Capital stock, \$100,000; 100 shares; \$1,000 per share. Trustees: Archibald C. Peachy, G. M. Granniss, Numa Hubert. October 15.

POTRERO HOMESTEAD ASSOCIATION.—San Francisco. Capital stock, \$13,120; 32 shares; \$410 per share. Trustees: G. S. Ashmead, James Laws, D. T. Jester. October 18.

CHEROKEE FLAT BLUE GRAVEL CO.—Butte county. Capital stock, \$65,000; 650 shares; \$100 per share. Trustees: A. Caselli, Edward Hunt, H. Kozninsky, O. P. Sutton, Julius Baadmann. October 19.

By a slip of the pen last week, we said cast iron instead of wrought iron, in alluding to the tubae of Mr. John Lochhead's improved steam boiler.

ARIZONA.

Mr. Chas. H. Leach, who has been engaged for some months in mining in Arizona, called on us the other day. He presented us with two specimens of rich ore, which are noticed among the "Contributions for our Cabinet."

Mr. Leach assures us that there are many other mines, partially opened, in the vicinity of Queen City lode, which show ore of equal richness. He says that all the country needs to secure for it a prosperous business condition, is a sufficiency of capital to develop a few of the most promising of these mines. The example would soon be followed, and the great richness of the country be demonstrated. The efforts which have been made to obtain from Government more complete and efficient military protection against Indians, have resulted in the issuing, on October 20th, of Special Order No. 206, providing for the establishment of two new stations, one at the mouth of El Dorado Cañon, and the other at Rock Spring, sixty miles west of that point. Camp Cady is also to be re-garrisoned with cavalry. This movement, together with the recently demonstrated fact of the navigability of the Colorado as far as Callville, will go far toward opening up the country to those who wish to invest in mining.

Mr. L. left us on the steamer of Tuesday last for the Atlantic States. He goes to Philadelphia, there to perfect certain arrangements for the working of the ledges belonging to the company which he represents, and whose principal office is in that city.

GREAT CENTRAL MINING COMPANY.—The principal operations of this company during the past year have been mainly confined to the Eliza copper lode, at William's Fork, Arizona. A statement made by the Trustees, Oct. 8th, shows that the company have made permanent improvements at the Great Central Camp, consisting of a dwelling, shop, etc., worth one thousand dollars, and have machinery and material on hand estimated, at low figures, as follows: Smelting works, engine, boilers, tools and machinery of all kinds, \$4,000; team and wagon, \$500; supplies, provisions, etc., \$1,000. The late Mr. Ehrenberg estimated the amount of pay ore in sight at 2,500 tons. Mr. Henry Martin, who visited the mine on the 21st of September, also reported that Mr. Thompson will make by the 1st of December, at the lowest calculation, \$10,000 worth of copper mata, as he is running all the furnaces. We hope the anticipations of the owners of the rich silver and copper mines of Arizona are now about to be realized.

Dr. B. M. Esterle, of Third street, in this city, has invented a plan for preventing cars on street railroads from running off the track. A strip of iron, wedge-like at both ends, is fastened to the inside of the rail. They are alternated in such a manner that opposite wheels do not touch them at the same time. If a fore wheel is thrown off the track, it is immediately brought on again by the opposite strip. So, also, in backing, if a hind wheel is thrown off. It will be especially useful at the curves. It will be likely to prevent, in some degree, the driving of other vehicles upon the track.

STOTT'S REFINED PETROLEUM.—We have received a can of "Charles Stott's California Illuminating Oil," which, we are assured, was refined by Mr. Stott's new process, for which he has recently applied for letters patent. It is of good color and burns with a steady flame, giving a brilliant and strong light. This oil is devoid of the offensive odor usually possessed by kerosene oil. It appears to be a superior article.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. Smith, M. D., Consulting Physician; R. S. Macbeth, M. D., Attending Physician; W. G. W. Harford, Manager; H. Andrews, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

ABSENT.—Mr. Ewer has been rusticated in Santa Clara and Santa Cruz counties during this week. Editorial remarks from that direction may consequently be expected in our next.

IMPORTERS OF
COAL OILS AND LAMP STOCK.
21v12-3m9p

Ready for the Steamer "Colorado,"

On the 1st of January, 1897.

TO BE PUBLISHED ON THE DEPARTURE AND ARRIVAL of the Pacific Mail Company's steamer to and from China.

THE CALIFORNIA
CHINA MAIL
—AND—
FLYING DRAGON
NEWSPAPER.

Printed both in the English and Chinese languages, for China, Japan, Australia, Borneo, Siam, Malacca, Singapore, Hindostan, etc., etc.

One of the immediate and most striking results of this mutual intercourse, will manifest itself in the fact that this country will be

EIGHT DAYS

Ahead of Europe in its commercial intercourse with the countries of the East; and ultimately this line of communication will be the preferred road of the silk trade, etc., instead of the Suez route.

The price of the "California China Mail" will be Twenty-five Cents per number—Annual Subscription, including Supplements, \$10 per Annum.

Advertisements, business notices, etc., in English only, will be charged fifteen cents a line; in CHINESE and ENGLISH, twenty-five cents per line; and one dollar extra for the translation of the first fifty characters; and one cent per character all exceeding fifty.

Copies of THE CHINA MAIL AND FLYING DRAGON may be had at all the offices of the Pacific Mail Steamship Company, in China and Japan.

A NOTABLE CITY.—An article by J. A. Blake in *Hunt's Merchants' Magazine* for September, on "Pittsburgh—Its Future and Present," commences thus:

"Pittsburgh is the greatest and richest mining center in America. It ranks the third city in manufactures, and its commercial facilities are unrivaled. Situated at the confluence of the Monongahela and the Alleghany, the banks of the former ribbed with coal veins and beds of iron ore from source to mouth, and the banks of the latter, with its tributaries, bordered by the richest of oil lands in the world; at the head of navigation on the Ohio, by which she has commercial intercourse with the whole great South and West, and the cities across the ocean; at the junction of the two richest rail thoroughfares in the country; yearly planning and receiving new channels for her trade East, West, North and South; and extending a network of railroads that control and bring to this city the product of every mining field within a radius of two hundred miles; forging the great guns and the iron clads that made the old Union strong again; and making plowshares, engines, and implements of agriculture for the 'piping times of peace,' the center of the great steel, iron and glass works; a Newcastle, a Sheffield, a Birmingham, a Staffordshire; everything that any city could ever aspire to be, in commercial, manufacturing, mining and political position, is Pittsburgh."

TO PRESERVE THE COLORS OF FLOWERS IN DRYING.—A vessel with a movable cover is provided, and having removed the cover from it, a piece of metallic gauze, of moderate fineness, is fixed over it, and the cover replaced. A quantity of sand is then taken sufficient to fill the vessel, and passed through a sieve into an iron pot, where it is heated, with the addition of a small quantity of stearine, carefully stirred, so as to thoroughly mix the ingredients. The quantity of stearine to be added is at the rate of half a pound to one hundred pounds of sand. Care must be taken not to add too much, as it would sink to the bottom and injure the flowers. The vessel, with its cover on, and the gauze beneath it, is then turned upside down, and the bottom being removed, the flowers to be operated upon are carefully placed on the gauze and the sand gently poured in, so as to cover the flowers entirely, the leaves being thus prevented from touching each other. The vessel is then put in a hot place, such, for instance, as the top of a baker's oven, where it is left for forty-eight hours. The flowers thus become dried, and they retain their natural colors. The vessel still remaining bottom upward, the lid is taken off, and the sand runs away through the gauze, leaving the flowers uninjured.—*Journal of Society of Arts.*

A STEAM FIRE ENGINE has been tried in Colorado as a substitute for the hydraulic in mining. It is said that it worked satisfactorily. It is quite possible that it would be desirable in some localities; yet we should suppose the expense would be a fatal objection, except where it was impossible to obtain sufficient fall in the old way.

Machinists and Foundries.

PALMER, KNOX & CO.,
Golden State Iron Works,
Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF
MACHINERY,
STEAM ENGINES AND QUARTZ MILLS
DUNBAR'S IMPROVED
Self-Adjusting Piston Packing,
Requires no springs or screws; is always steam tight;
without excessive friction, and never
gets slack or leaky.

WHEELER & RANDALL'S
NEW GRINDER AND AMALGAMATOR
HEPBURN & PETERSON'S
AMALGAMATOR AND SEPARATOR,
Tyler's Improved Water Wheel,

Giving the greatest power, at lower cost, than any
Wheel in use. There are over 1,500 running,
giving universal satisfaction.

KNOX'S AMALGAMATORS,
WITH PALMER'S PATENT STEAM CHEST,
Superior for working either Gold or Silver Ores.
Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past eight years in quartz
mining, and being conversant with all the improvements,
either in Mining or Milling, we are prepared to furnish,
at the shortest notice, the most perfect machinery for redne
ing ores, or saving either gold or silver.

THE MINING AND SCIENTIFIC PRESS, published by Dewey
& Co., San Francisco, should be in the hands of every
miner. It gives every week information that is indispen-
sable to the proper prosecution of mining. Every miner
can avail himself of the latest improvements by subscrib-
ing for it.—[Havilah Courier, Oct. 13.]

THE MINING PRESS has entered upon its thirteenth vol-
ume. It is a valuable publication in its sphere, and its
sphere is a large and important one.—[Marysville Appeal,

Established in 1849—Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW
prepared at the shortest notice and at the most reasonable rates, to furnish all
kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps
of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental
Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag,
Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all
kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats,
Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six
to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in
use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam
Pump and Fire Engine.

BOILERS. Locomotive, Pac, Tubular, Upright, Cylinder and Cornish, and every
variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These
very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory
Curve Pan, Zenus Wheeler's Improved flat bottom pan, Beklin's pan, Vasech's tubs,
Prater's concentrators, Vakee's pans, Beers' pan, German Barrels, Arastra Gearing, China
Mills, Settlers of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Bat-
teries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams,
Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS,** of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most ap-
proved construction, made from drawings lately made by Prof. Blake at the oil wells in
Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to
test their value, by the hundred weight or ton.

Russia Iron Screws, of all degrees of fineness and of all qualities of Iron. All work done
in the best manner at the lowest cash prices.

MOUNT DIABLO COAL.

CHEAP FUEL!

Cheaper than the East.

From the Independent Mine, at \$10 per ton.

GREENHOOD & NEWBAUER,

Nos. 207 and 209 Sansome street, between California
14v13-3m and Pine.

Delays are Dangerous.—Inventors on the Pacific
Coast should bear in mind that by patronizing our Patent
Agency they can sign all necessary papers for securing pa-
tents almost immediately, thereby avoiding the three
months' delay requisite in transacting business through
Eastern agencies.

New Mining Advertisements.

Arbitros Mining Company, Batopilas Dis-
trict, State of Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of
Trustees of said Company, held on the thirty-first day of
October, 1866, an assessment (No. 12) of one dollar and a
half (\$1.50) per share was levied upon the assessable capital
stock of said Company, payable immediately, in United
States gold and silver coin, to the Secretary, at his office,
No. 811 Montgomery street, up stairs, San Francisco, Cal.
Any stock upon which said assessment shall remain un-
paid on the fourth day of December, 1866, shall be deemed
delinquent, and will be duly advertised for sale at public auc-
tion, and unless payment shall be made before, will be sold
on Saturday, the twenty-second day of December, 1866, to
pay the delinquent assessment, together with costs of adver-
tising and expenses of sale. By order of the Board of
Trustees.

A. MARTINON, Secretary.

Office, 811 Montgomery street, San Francisco, Cal.

N. B.—Until further notice, all advertisements of this
Company will appear in the "Mining and Scientific
Press." n03

Chilpaneca Mining Company—District of Ures,

Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of
Trustees of said Company, held on the thirty-first day of
October, 1866, an assessment of five (\$5) dollars per share
was levied upon the capital stock of said Company, pay-
able immediately, in United States gold and silver coin, to
the Secretary, at his office, No. 318 California street, up
stairs, San Francisco, Cal.

Any stock upon which said assessment shall remain un-
paid on the first day of December, 1866, shall be deemed
delinquent, and will be duly advertised for sale at public
auction, and unless payment shall be made before, will be
sold on Monday, the seventeenth day of December, 1866,
to pay the delinquent assessment, together with costs of ad-
vertising and expenses of sale. By order of the Board of
Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, Up stairs, San Francisco, Cal-
ifornia. n3

And in accordance with law, and an order of the Board of
Trustees, made on the twentieth day of September, 1866, so
many shares of each parcel of said stock as may be neces-
sary will be sold at public auction, at the auction room of
Maurice Dore & Co., No. 327 Montgomery street, San Francisco,
Cal., on the twenty-seventh day of November, 1866, at the hour
of 12 o'clock, M., of said day, to pay said delinquent assess-
ment thereon, together with costs of advertising and expenses
of sale.

G. O'HARA TAAFFE, Secretary.

Office, No. 430 California street, San Francisco. n03

Volunteer Twelfth—The Mining and Scientific Press

with its last issue, commenced its twelfth volume. Since
Dewey & Co. have "held the ribbon" its gait has been
rapid toward a perfect journal. Its appearance evidences
its prosperity, but doubtless, like some of the rest of us,
it can stand increased encouragement. Let such his given,
and our word for it, volume thirteen will acknowledge
receipt.—[Golden Era.]

MINING AND SCIENTIFIC PRESS.—We received a visit a few
days since, from Mr. Wood, agent for the MINING AND SCIENTIFIC
PRESS, who is now canvassing this county for sub-
scribers to that valuable journal. The Press is invaluable
to miners and mechanics, being the only journal of any
importance on the coast entirely devoted to their inter-
ests.—[Mountain Messenger.]

I. X. L. Gold and Silver Mining Company, Silver Mountain District, Alpine County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-ninth day of September, 1886, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees, made on the twenty-ninth day of September, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 333 Montgomery street, San Francisco, on the twentieth day of October, 1886, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JAMES C. DAYLEY, Secretary.

Office, No. 333 Montgomery street, San Francisco, Cal.

no3

Mining Notices—Continued.**Adella Gold Mining Company, Rock Creek, Sierra County, California.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of October, 1886, an assessment of one (\$1) dollar per share was levied upon the capital stock of said Company, payable immediately, in gold coin, to the Secretary, at 410 Market street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of November, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and if payment is not made before, will be sold on Saturday, the twentieth day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. C. TAYLOR, Secretary.

Office, 410 Market street, San Francisco, Cal.

no37

Coan Silver Mining Company, Coan District, State of Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-ninth day of September, 1886, an assessment of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in gold coin of the United States, to CHAS. BAUM, Secretary, at the office of this Company, No. 510 Battery street, opposite the Custom House, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the thirty-first day of October, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the nineteenth day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. BAUM, Secretary.

Office, No. 510 Battery street, opposite the Custom House, San Francisco, Cal.

1519-1w

Ethan Allen Gold and Silver Mining Company, Location of Works, Austin, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of October, 1886, an assessment of fifty cents (50) per share was levied upon the capital stock of said Company, payable October sixth, 1886, in United States gold and silver coin, to the Secretary, at the office of the Company, 620 Washington street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the sixth day of November, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-seventh day of November, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

H. B. CONGDON, Secretary.

Office, 620 Washington street, (Room 5) San Francisco.

no6

Favorable to Investors.—Persons holding new features of machinery and important improvements, can have the same illustrated, and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Owing to its general circulation, the MINING AND SCIENTIFIC PRESS has perhaps been as valuable and useful to the mining community as any other paper. The London "Lancet" was to the medical profession, acting either as a scarifier when too great a plethora of minia bubbles prevailed, or as a styptic when dangerous bleeding of the pockets of the capitalists was coerced. (Copperopolis Courier, Oct. 13.)

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in foreign countries. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Great Central Mining Company—Location of Works: Yuma County, Arizona Territory.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of October, 1886, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, San Francisco, Cal., from 4 to 5 P. M.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of November, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the third day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, No. 302 Montgomery street.

GEORGE WASHINGTON GOLD AND SILVER MINING COMPANY, Silver Mountain District, Alpine County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the seventeenth day of September, 1886, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees, made on the seventeenth day of September, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 418 Montgomery street, San Francisco, Cal., on Monday, the fifth day of November, 1886, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. O. WOOD, Secretary.

Office, 333 Montgomery street, San Francisco.

no29

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Fram; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity, "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burned. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,
WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
171 San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to
KNAPP & GRANT,
—ALSO—
San Francisco.

Leffel's Lever Jacks,
For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind.
For sale by
KNAPP & GRANT,
1212-3m San Francisco.

To Ditchmen, Millmen and Others Requiring
IRON PIPE.

M. E. ROSE, CORNER OF 9TH AND K STREETS,
Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground.

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada. Parties wishing to erect such Furnaces, are requested to leave their orders with
T. KALLENBERG,
1912 418 Market street, San Francisco.

THOMAS H. SELBY & CO.,
22v12-3m Nos. 116 and 118 California street

Economy in Advertising.—The **MINING AND SCIENTIFIC PRESS** is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

AUSTRALIAN GEOLOGY.—The Melbourne, Australia correspondent of the *Bulkein*, writing under date of August 28th, has been paying some attention to the geology of that country. He says: I had recourse to the Government geologist, a very communicative gentleman, in the receipt of a very handsome salary (\$10,000 per annum), and who has no wish to make himself unpopular, at the same time that he is desirous of keeping up that dignity which should become so well paid an office, and exercises a proper reticence when giving opinions which enhances their value by showing the results of much information and grave deliberation. You may be assured that he has an excellent opinion of the auriferous nature of this country, and has, like all men of scientific mind, got up his theory—"the quartz reef theory"—upon which he has published a report; and as it may be suggestive to Californians I give an extract. He says:

During the progress of my geological survey, deposits, from a mere capping to over 300 feet thick, have been met with in several localities, from sea-level to an elevation of 4,000 feet. These consist of beds of clay, sand, cement or conglomerate gravel and large boulders, water-worn and composed either of quartz, quartz rock, or hard siliceous sandstone. They rest on the ordinary slates and sandstones (Silurian) of the gold fields, and are often in the vicinity of rich gold-bearing quartz reefs. They appear to be of the miocene age, and ought to be auriferous. But (the report goes on to say), numerous shafts have been sunk and levels driven into them in the most likely places in various localities, both by miners and by the Geological Survey parties, but always with an unsuccessful result. In some places they occur in close proximity to rich quartz reefs, and the more ancient alluvial deposits near the same reefs are also auriferous, while every attempt, and many have been made, to find paying gold in the older gravels, either on the hills or in the valleys, has proved unsuccessful.

So much for this scientific gentleman's investigation in this part of the world.

Another great geologist contends that gold may be found as low down as the carboniferous period, though no Australian miner has yet mentioned a single instance of having found gold in drifts older than the pliocene. The Australian savans say that whereas in the earlier times the earth seems to have vomited forth rocks of a granitic texture, in the secondary age greenstone and porphyry, and in the tertiary period basalts of various kinds were nearly the only instances of igneous products poured forth from the earth's interior; whilst in these degenerate days modern volcanoes content themselves with discharging ashes. They contend that even in metallic veins this variety is apparent, and that there are plenty of instances of those veins cutting each other; one contains tin, a second copper, and a third some other mineral. And it is further asserted that there is strong presumptive evidence to show that quartz veins are being found at the present day which may or may not be impregnated with metallic substances.

THE MANGANESE MINE.—Captain Faill writes thus to the *Atlas* of the manganese mine at Red Rock, in San Francisco bay, twelve miles from the city:

The mine is owned by the "California Manganese Mining Company." Several prospect pits have been sunk on the property and also shallow drifts, to the extent of some few feet, but the main tunnel is situated near high water mark, from one hundred and fifty feet to two hundred feet below the summit of the rock. This tunnel has been extended forty feet southwards, cutting two splendid lodes of manganese, denominated as the "front ledge" and the "back ledge." In the front ledge operations have been carried on for the past two months. The fullness of the ledge is demonstrated by the fact that in three weeks five miners extracted upwards of sixty tons of first-class ore, the market price of which is thirty dollars per ton. There is no doubt that this class of ore continues through the length and height of Red Rock Island. Such being the case, 3,200 tons of manganese will not exhaust what is known to exist in this valuable mine; neither will \$96,000 be overating the value of the mineral standing above high water mark. The ore is extracted by contract at ten dollars per ton, the contractor agreeing to pay all expenses from the raising of the ore to its delivery at San Francisco.

A NEW PROCESS for manufacturing lucifer matches has been brought before the French Academy. The wooden slips are first plunged into phosphorus and afterwards into sulphur, thus reversing the ordinary mode of preparation.

A SINGLE ounce of gunpowder, placed at an angle of forty-five degrees, is capable of projecting a 24-pound cannon ball a distance of three hundred and fifty yards.

LEDGES "CAPPING OUT."—The Nevada Gazette has the following: We were conversing yesterday with a practical miner who has spent several months during the present season in Meadow Lake district, and in whose opinions and judgment we place reliance. He does not regard the ledges as having been sufficiently opened to establish the future of the district. A large number of ledges contained the richest quality of rock near the surface, but in sinking upon many of them, the wall rock closed in, and the ledges apparently pinched out. This feature of the ledges is well known there, though little is said of it to outsiders; but it has a tendency to discourage the owners from opening and exploring their mines. A similar peculiarity exists in the quartz mines of Colorado Territory. It is quite common there for the walls to curve in such a manner as to apparently cut off the ledges; but then they always find the ledges again by sinking deeper upon the regular line of the dip. It is called there "capping out," and at first caused a great deal of surprise and discouragement. Now, however, when a ledge caps out the owner strikes through the wall rock, certain of finding it below. The experience of the Colorado miners ought to encourage mine owners at Meadow Lake to persevere, and sink through the cap rock. An instance was never known of a regular mineral vein giving out in depth, though the dip frequently curves, or varies from a straight line, and even the largest ledges sometimes pinch down to mere seams.

MINING PATENT SUIT.—R. H. Dunning, of Bridgeport township, has brought suit in the United States District Court against Jenkin Morgan, for infringement of a patent in constructing and using the Separator or "Under Current," for which Dunning has a patent. The machinery is constructed in the bottom of the sluice boxes, and is used for separating the black sand and fine particles of gold from the tailings. The defendant claims that plaintiff is not the inventor of the machine, but adopted an old and well established principle, as applied in the "Old Grizzly," and other similar contrivances of the miners in early days. The testimony will be of considerable length, J. B. Johnson, Esq., of North San Juan, having already taken about four hundred folios of depositions.—*Nevada Transcript*, Oct. 27.

Auction House.—Messrs. Olney & Co. have opened a General Auction and Commission House, No. 413 Montgomery street—a very central and convenient location. Mining and other Corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Besides every kind of auction business, this firm will pay special attention to the purchase and sale of real estate in Oakland.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,
And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the MINING AND SCIENTIFIC PRESS.

RUGGLES' PRINTING PRESS.
For Sale or Exchange.

The Proprietors of the MINING AND SCIENTIFIC PRESS have on hand a Half-Medium Ruggles Engine Job Press, in condition good as new, which will be sold cheap, or exchanged for a good Hand-Press of medium or large size.

At the Golden State Iron Works, No. 19 First street, San Francisco.

CAUTION!

NOTICE TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1861, and issued June 27th, 1863, to Professor Henry Wurtz, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY,
OF NEW YORK.

Assignees of letters patent granted to Prof. Henry Wurtz, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.
The terms and conditions upon which rights to use the process are obtainable, can be had on application to
W. M. SLOSSON,
Agent of the Company, Union Iron Works, corner of First and Mission street, San Francisco.

NEW YORK PRICES.

C. E. COLLINS,
No. 603 Montgomery street, San Francisco.
EXCLUSIVE AGENT
—FOR THE—
AMERICAN
WATCH FACTORY.

A large assortment of these
Superior Watches,
In Gold and Silver Cases,

Constantly on hand, and sold at Factory prices. Also,
ENGLISH AND SWISS WATCHES,
Imported directly from the Manufacturers.

The American Company are now making
VERY FINE WATCHES FOR LADIES.

Also a large assortment of Gold Chains and Jewelry.

NEW YORK PRICES.

TIME & LABOR SAVED
—BY USING—
STANDARD SOAP COMPANY'S
WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material, and contains nothing that will injure the fine fabric. Equally as good for use in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1 lb each, and in wooden boxes of 10 lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco.

WE ARE NOW OFFERING
OUR IMMENSE STOCK
—OF—
Fine Custom Made Clothing

Gents' Furnishing Goods

AT PRICES THAT DEFY COMPETITION.

Cor. of Washington and Sansome streets.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Shelling Quartz, or other Rock, possessing as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:
No. 1.—Or 6 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut price..... \$600
No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour..... 850
No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, drives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

Rawhide Ranch, Tuolumne Co., Sept. 25, 1863.
JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's mill, which is entirely met my expectations; and I have no hesitation in recommending to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1861. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st No. vember, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel per year.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power.

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, AND ECONOMY, WITH THE MINIMUM OF WEIGHT AND PRICE.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises.) In fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Tread Mill.
For sale by
TREADWELL & CO.,
18v12 Corner of Front Market and streets.

KUSTEL & PETERSON'S CONCENTRATOR.—This self-discharging concentrator is a peculiar percussion table. It seems to be derived from a percussion buddle, of which it represents a segment brought into a square shape, acting on the same principle as the buddle, but differing in a main point. Whilst the latter is inclined toward the periphery, the segment has a reverse pitch, so that the feeding is applied on the end representing the periphery. The pulverized stuff is conveyed over a distributor on the table, where it follows the impulse of the water downward; but the denser or ore-particles are diverted to a transversal course by the percussion, which has less effect on the lighter or gangue particles. The force of the percussion decreases as it is nearer to the center of the circular motion; and this seems to be an important item, as it is known that different grain sizes of the same mineral require a different force of the percussion. In this respect, Kustel & Peterson's concentrator differs also materially from Rittinger's percussion table. The separation of ore from gangue by this concentrator, which is very simple in its construction, appears comparatively perfect, and it is not only eminently adapted to receive the crushed ore direct from the battery, but it will be especially desirable in mills where unroasted ore is being amalgamated in pans for saving sulphurets, and especially the fine quicksilver and amalgam which may escape. This machine can be seen in operation at the Miners' Foundry, in this city. Action has been taken toward securing a patent, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

SAFETY FUSE.—In an article on the California Powder Works in Santa Cruz county, the *Bulletin* speaks of the necessity which exists for the establishment of a safety fuse manufactory on the Pacific coast. Up to this date, all of that article used has been imported. The great bulk of it comes from Connecticut; a small portion from Great Britain. The consumption for mining and railroad purposes is immense—millions of feet being used annually. This fuse, on its voyage of importation to this market, is very liable to dampness, from sweating or sea air, and used in its often imperfect condition has been the frequent cause of loss of life and bodily injuries. It is safe to estimate that at least one-half of the accidents resulting from blasting on the Pacific coast have been caused by damaged fuse.

OUR NEW YORK AGENCY.

Mr. Geo. M. Newton is our authorized agent in New York City, and will receive advertisements and subscriptions for the MINING AND SCIENTIFIC PRESS at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "Stockholder," No. 72 William street.

Under the management of Messrs. Dewey & Co., the Press has been much improved in every respect. It deserves a liberal support.—[Virginia Union.]

HUNGERFORD'S IMPROVED CONCENTRATOR,

FIG. 1.

For Saving Gold, Sulphurets, Quicksilver, Etc.

FIG. 2.

have been tried, and many abandoned; all of which have been unable, so far, to attain a profitable separation, and improvement on the well-known Hungerford & Prater Concentrator, with which his name is already so familiar. The separating or concentrating action is obtained by centrifugal force and gravitation; the pulp being preserved by water in the proper condition for the operation, and the pan so constructed, mechanically, as to allow the centrifugal force and gravity to expend themselves to the best advantage in producing the separation, as well as to make the machine simple, compact, and easily kept in order.

Fig. No. 1 is a perspective view of the Concentrator while in operation, showing the general arrangement. Fig. No. 2 is a section through the centre of the pan, showing how it operates in separating the sulphurets, as well as the great improvement to the pan, which consists of the addition of a circular trough outside the periphery.

Its operation is as follows: The pulp flows from the spout through the filter into the bowl at the top, from which it is distributed equally over the convex cover into the pan near its outer edge. The lightest sand is at once carried off with the overflowing water through the centre opening, and the sulphurets are allowed, from the motion given to the machine, to gravitate to the bottom toward the outer edge, forming an embankment all around the pan, as represented at 1, 1, Fig. 2. The lighter particles of the sand arranging themselves on the top at 2, 2, Fig. 2, from which they are being constantly washed away with the water flowing through the central opening. The sulphurets are, by the centrifugal motion of the machine, made to pass through small openings at the bottom, at intervals of a few inches around the circumference, through the inner wall of the pan to the circular trough, 3, 3, Fig. 2, where they come in contact with the mercury at the bottom, depositing the free metal, from which it is drawn at pleasure by an opening in the bottom, and the sulphurets, in the order of their density, by openings in the sides.

It will be observed that the sulphurets in the trough, 3, 3, are maintained at the same elevation as the sulphurets and overlying sand in the body of the pan. It will be further observed, that by no possible means can the sand in the latter pass to the former in such quantities as to form any considerable percentage of the amount saved. The advantages of this improved pan are continuous action, requiring no attention except to remove the receiving vessels as fast as they are filled from the openings shown on the right of Fig. 2, simplicity in construction, and durability and cheapness of cost.

The pan derives its motion from two eccentrics secured on a horizontal shaft passing across and below the centre of the pan and working between two pairs of adjustable wooden guide blocks or bearings. The eccentrics are so made as to bear equally on the wooden guide blocks in all positions while in motion; giving to the pan the most desirable motion for its purpose, and doing away with all complexity of rods, cranks, wooden frame, etc.

These pans are now being introduced into the best mills in the country. Reference to parties who have tested them can be had by applying to the manufacturers.

Those interested in mining, and who call at the Miners' Foundry to see the one which is there in operation, will have no reason to regret their visit.

San Francisco, June, 1866.

WORDS FOR MINERS.—The Gold Hill Daily News, Nevada—a medium of good authority—reads thus:

The MINING AND SCIENTIFIC PRESS is a weekly journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would tend vastly to the particular "posting" and general enlightenment of our sort of working folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have an agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

Change in Prices.

Single Copies of the MINING AND SCIENTIFIC PRESS will hereafter be sold at FIFTEEN (15) CENTS. By City Carriers, 60 Cents per month; Monthly Series, 65 Cents. The rates of Yearly Subscriptions in San Francisco, by carrier, \$6; through the city post office (postage free) \$5 per annum. Agents in the Interior supplied by wholesale news dealers in San Francisco. June 30, 1866.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

PHILADELPHIA AGENCY,

Parties wishing to subscribe or advertise in the MINING AND SCIENTIFIC PRESS can be accommodated by calling upon our Agent, Mr. TRAMER HAMILTON, at the Assembly Building, 106 South Tenth street, Philadelphia, Pa., where sample copies of our publications can always be found.

Companies

Elegantly printed, with care and dispatch, at the office of the
Mining and Scientific Press.

Orders from the Interior faithfully attended to.

Endorsement by the Miners' State Convention

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Mining and Scientific Press.

Terms: One Year, \$5; Six Months, \$3.

Single Copies, Fifteen Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS,
And Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 10, 1866.

VOLUME XIII.
Number 19.

NOTES OF TRAVEL.

NUMBER ONE.

Desirous of obtaining a few days of respite from the ceaseless toil of editorial life, we stepped on board this morning train for San Jose, on Friday of last week, and were soon whirling along the iron track to the pretty little village of Santa Clara, where we took stage for Lexington. A trip through the San Jose Valley, just previous to the full rains, is nothing but a pleasant ride to most people, on account of the clouds of dust which every vehicle is sure to carry with it at that season of the year. To one, however, who had never visited that garden spot of California, there was so much of interest to see and learn, that the dust and dirt was almost unnoticed.

The first thing that attracts the attention of the traveler, after passing the suburbs of the town, is the bold range of mountains directly in front and separating the San Jose Valley from Santa Cruz and the sea coast. These mountains rise boldly up from the plains, and present a surface almost entirely divested of trees or shrubbery of any kind, and seemingly interpose an almost insurmountable barrier to wagon locomotion in that direction. Journeying along, however, at first through orchards and vineyards almost innumerable, in a black adobe soil, the traveler soon finds himself passing through an open plain, covered at this time of the year with one broad expanse of wheat stubble, divided up into large square fields, each field constituting a good sized farm. The huge piles of straw and heavy remnant of stubble attest to the abundance of the past season's crop, and give unmistakable indications of the point from whence has been received a large portion of those immense piles of grain, which may be seen covering the wharves and filling to overflow the huge warehouses along our city front.

As we advance toward the mountain, the soil gradually assumes a gravelly character, giving unmistakable evidence of the great pluvial action, which at some former period has carved out the deep ravines, which at our near approach begin to form so prominent a feature on the naked mountain slope. The altered character of the soil is also apparent in the evidence of thinner crops, and frequent groves of oak, interspersed here and there with thick chaparral, which grows some three or four feet in height, and is sustained by a thick clumpy root, which, by its slow growth, is of so firm a texture as to be almost equal to coal for fuel. We were told that this root was so easily removed from the soil and so abundant, that laborers were willing to clear the land of the chaparral for the fuel thus obtained. Much of the land, when thus cleared, will produce a very good growth of wheat; and with a small part of the cultivation and dressing bestowed upon land in the New England States, might be made to produce first class crops.

LExINGTON CANON.

About ten miles from Santa Clara we strike boldly into the mountains, through a narrow defile, along which a most excellent grade has been constructed at much labor and cost. This portion of the road calls forcibly to mind the

grade over the Placerville route to Washos, and excites in the mind of the timid traveler no little uneasiness lest the vehicle in which he sits may at some unlucky turn be suddenly plunged down the steep hillside into the canon below. In order to add interest to such reflections, one of our fellow passengers took especial pains to point out the locality where the stage was upset, a few weeks previous, while whirling around one of those sharp turns, and by which accident several ladies from this city were seriously injured. Upon one, however, who had passed over the Sierra Nevada by three or four different routes, and "come the plains across," such tales had but little effect. About two o'clock in the afternoon we found ourselves snugly ensconced in the domicile of an old friend, Mr. Stillman Thomas, one of the pioneer lumbermen in this canon. This is the principal locality from whence has been derived the redwood lumber, which has found its way in such immense quantities to San Jose and Santa Clara for the past sixteen years.

ANCIENT SAWMILL.

About two miles from the mouth of this canon, may still be seen the frame of an old sawmill, the construction of which ante-dates the famous Sutter mill at Coloma, and for ought we know to the contrary, may have been the first mill ever constructed in California. At that time the entire west bank of the canon was covered with a dense growth of redwood, which makes, for common purposes, the best lumber in the world. Much of this growth was very large.

BIG TREES.

We saw the stump of one tree which was cut down a few days previous, that measured fully thirty-six feet in circumference, three feet from the ground. The trunk, at a length of 160 feet from the stump, measured four feet in diameter; above that point the tree was broken into fragments in falling. We counted the number of annular rings of these trees to the inch, in several different localities, and found the average not far from thirty-five to the inch. That number would give the tree above mentioned an age of over 2,000 years! Calculating from the same basis, some of the big redwood trees of Calaveras would ante-date even the creation, placing that event at the point of time fixed for it in Archbishop Usher's chronology, adopted in King James' translators of the Bible.

The magnificent forest growth which formed the crowning feature of this canon ten years ago, has now almost entirely disappeared, and by another winter the sound of the saw will scarcely be heard throughout its entire length. It will, however, for years to come, continue to furnish large amounts of fencing stuff and fuel. There is no doubt but that

THE VINE WOULD FLOURISH

Here to much greater perfection than in the neighboring valley. To our mind the people of California are making a great mistake in planting vineyards in the valleys and on the plains. The hills and mountains furnish the best locality for grapes, especially when they are raised for making wine. We read of the vine-clad hills of France and Italy—never of the vine-clad plains. Let our wine-growers leave the plains to orchardists and the growers

of wheat and vegetables. The time will soon come when all that kind of land will be needed for such purposes.

Dr. McMurtrey, of Lexington, we are pleased to observe, has been experimenting with the vine on his ranch, which occupies a little opening about midway of the canon. He informed us that he had found it impossible to cultivate grapes successfully at a point lower than about 300 feet above the lowest portion of the canon, on account of the frost. After ascending to about that height, the ground is free from frost, and the vine flourishes in its greatest perfection. His example and success should encourage others. We feel quite well assured that this canon presents one of the finest points for vine culture in the entire county. The soil is rich, well watered and drained, entirely free from fogs, and also from frost, above the height mentioned.

AN AERIAL RIVER.

The frost in the lower portion of the valley is undoubtedly due to a current of cold air, which forms, in fact, a cold aerial river of some three hundred feet in depth, varying in width according to the inequalities of the canon, and which is constantly pouring over the divide from the ocean beyond Santa Cruz, and flowing down the declivity of the canon, until it is spread out and lost and warmed in the plain below. Above the surface of this aerial current, and below the fog which often covers the mountain tops, but does not descend far down the sides of the canon, is the belt of land along which the vine will grow, and which might thus be turned to a most profitable account—much better than to be deserted, as it now promises to be as soon as the timber is all removed. We have numerous other "notes of travel" taken during our trip, which we shall endeavor to find room for in future numbers.

MUNICIPAL REPORTS.—We acknowledge the reception of the San Francisco Municipal Reports for the fiscal year ending June 30, 1866, and published by order of the Board of Supervisors. The publication forms a volume of 430 pages of carefully prepared statistical matter, detailing the condition of the city debt, the city litigation, the mortality reports, street work, etc., which will be found indispensable to every person who would become intimately acquainted with the condition and progress of the municipal affairs of this city.

HANSBROW'S PUMPS.—These pumps are made at the San Francisco Foundry, and we never go into that establishment without seeing numbers of them in progress of construction. The demand for them must be large, affording evidence that the long time which they have been in use has tended to establish their reliability and value. They are simple in construction, and well made. Buyers may always know where to get these pumps, as well as other really valuable machinery, by consulting the advertising columns of the MINING AND SCIENTIFIC PRESS.

CEMENT MINES.—See our mining summary for new and probably extensive cement discoveries in Sacramento county. Are the days of '54 coming again?

California Academy of Natural Sciences.

REGULAR MEETING, Monday, Nov. 5, 1866.
President in the Chair.

Fifteen members present.

Rev. S. D. Simonds and Dr. J. Morrison were elected resident members, and Dr. W. P. Gibbons, of Alameda, corresponding member.

Mr. Bolander presented for exhibition a curiously fruited specimen of *quercus densiflora*, the acorns being about one third the ordinary diameter, though nearly the usual length, and having a peculiar constriction near the apex.

Mr. Stearns exhibited a specimen of an *Aspitylon*, caught in the Ochotsk Sea, off Cape Lepatka, Kamschatka, by the crew of the fishing brig Angenette.

Dr. H. Gibbons called the attention of the Academy to the near approach of the season during which we might look for the recurrence of the "meteoric shower," which he witnessed in the year 1833.

Many interesting remarks were made by Messrs. Gibbons, Keyes, Kellogg and others, in reference to the phenomenon of meteors, and considerable discussion as to the various ideas and theories in connection with the same by different authors.

Mr. Stearns also exhibited several specimens of *Acmea asmi*, Midd., collected by him at Baulines Bay; remarking that upon a recent trip to the locality named, he found this species exceedingly numerous, attached to *Chlorostoma funebre* A. Ad.; that he had not seen in a single instance this *Acmea* upon the rocks; neither had he observed any other species of *Acmea* upon a living specimen of this *Chlorostoma*. Mr. Stearns further submitted for the inspection of the Academy, a specimen of *Haliotis Cracherodii*, which he had collected alive last month, on the rocks near the outlet of Lobitas Creek into the ocean. The *Haliotis* had been attacked by a *pholad*, probably *Navea Newcombi*, and had defused itself by adding coating upon coating of nacre, as the *Navea* progressed, until a large knob or protuberance had been created in the interior of the shell. From a partial examination of the borer, a specimen of which he had dug out from another portion of the same *Haliotis*, he believed it to belong to the species recently described by Mr. Tryon, viz: *Navea Newcombi*. Adjourned.

OUR PAPER.—Hereafter our patrons may expect to find the PRESS constantly printed on a superior quality of white paper, shipped regularly to our order from New York. Although we have used the very best quality, at all times, attainable in this market, we have frequently felt mortified with the dingy and flimsy character of the paper we were compelled to use. It is our aim to issue the best looking paper on this coast.

THE Board of State Capitol Commissioners adopted resolutions exonerating G. P. Cummings, the architect, from all blame on account of the settling of the walls, and attributed it to a defect in the work for which the original architect is responsible.

A DESIRABLE ARTICLE.—Dr. Boynton's Medicine Chest, advertised to-day.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Notes on the Chief Gold Districts Throughout the World.

BY PROFESSOR ROWLANDSON, F. G. S. L.

[Continued from Page 226.]

Time and space only permit a rapid glance at the principal gold fields hitherto unnoticed in the course of these sketches; before doing so, it may, however, be remarked that in the gold districts about to be described, that metal is usually associated with silver, a circumstance which occurs in the State of Nevada, and some other places. Only a very indistinct, if any true geological line of demarcation, can be drawn between the species of rocks in which gold and silver, alone or combined, attain a predominant value. It is not necessary, however, at the present moment to dwell upon these circumstances; some of the more remarkable general features will be noticed in a succeeding and concluding paper on the Age of Gold-Bearing Rocks; in the meantime the description of the auriferous fields found in the balance of the American continent will be proceeded with, commencing with

MEXICO.

Until very recently it was usually esteemed an accepted fact that the gold and silver mines found in this celebrated region belonged to the paleozoic series of rocks, or associated granites, porphyries and greenstone. This opinion has been proved to be entirely erroneous by Mr. Remond.* He has stated, amongst other items, the following particulars:

The igneous rocks, which occur more abundantly on the Pacific slope, are granites, either fine or very coarse-grained; porphyries, more or less feldspathic; and greenstones, all of which are cut by numerous dykes of extremely varied character. The granites, however, are very poor in veins of the precious metals, while the porphyries are highly metalliferous. In Sinaloa (Candelero) and Durango (San Dimas) we see that the granites underlie the metalliferous porphyries, and that the greenstones, in Sonora, (near Hermosillo) and in the vicinity of La Hacienda) penetrate through them.

The oldest sedimentary rocks, which I have observed, belong to the Carboniferous series; this is represented in the eastern part of Sonora, by heavy masses of limestone, forming very high and rugged ridges, rising a little west of north. The upturned strata are seen, in many places, to rest on granite. Argentiferous veins occur throughout this formation.

The next group of sedimentary rocks, in order, is the Triassic; this forms isolated mountain groups in Sonora, and offers an interesting field for investigation. Instead of limestones, it is made up of heavy beds of quartzites and conglomerates, with coal-bearing clay shales; all of these are disturbed and elevated, and rest on greenstones, feldspathic porphyries, or granite. Wherever metamorphosed, the Triassic rocks are auriferous and contain veins of silver ores. The metamorphic slates and limestones of the Altar and Magdalena districts, which include the richest gold placers of Sonora, may possibly be of Triassic age; but the fossils collected are too imperfect to admit of this being determined. There are some reasons for believing those rocks to be rather of Jurassic than of Triassic age, as they differ in lithological characters from both the Triassic and Carboniferous of Northern Mexico, resembling, rather, the Jurassic gold-bearing slates of the Sierra Nevada in California; besides they lie outside and to the west of the Sierra Madre. It may also be noticed that the gold which they furnish does not resemble that obtained from the Triassic strata.

The Cretaceous period is also represented at the foot of the Sierra Madre, at Arivechi, in Sonora. The strata belonging to this series are chiefly argillaceous shales, and they rest upon porphyries and Carboniferous limestone. They have been disturbed and elevated since their deposition. The fossils, which they contain in great number and in a fine state of preservation, will be noticed further on.

All the above mentioned formations were already in existence before the first eruption of the volcanic rocks took place. These latter are found scattered along the whole Pacific coast, and extend from the Gulf of California up to the very summit of the Sierra. It is very interesting to see the volcanic formations

spread over so extensive a region, especially as there are no active volcanoes known in Northern Mexico, and not even any indications of ancient craters or vents.

The lithological character of the eruptive materials is extremely varied, and there seem to have been several periods of igneous action preceded by as many disturbances of the strata, all of which took place after the close of the Cretaceous epoch. Three different series of volcanic rocks may be observed in Sinaloa and Sonora, unconformable with each other; and these may again be subdivided into groups, after a thorough examination has been made of the extensive suite of specimens which has been collected. The lower, or oldest series, affords several hundred varieties of porphyries, characterized by crystals of feldspar or angite. There are also very peculiar trachytic rocks, resembling granite in appearance. These volcanic materials occur in beds or in masses, and are frequently cut by dykes; but they are quite destitute of veins containing gold or silver, the only metalliferous ores they contain being those of copper (?) and iron, and these in small quantity. Various volcanic ridges in Sonora belong to this class. The second series consists of extensive beds of micaceous, trachytic tufas, and breccias, all more or less uplifted since their deposition, and covering the different igneous and sedimentary formations, as well as the older volcanic porphyries. These attain a great thickness, between San Dimas and San Ignacio, in Durango and Sinaloa.

Above these formations occur ancient alluvial deposits, with bones of extinct animals (elephants) at two localities; near La Noria, northeast of Mazatlan, and in the Arroya de la Palma, two leagues east of La Casita, in Sonora.

Sheets of basaltic lavas, somewhat similar to those of California, and probably of the same age, forming with tufas the upper volcanic series, overlie the other formations, occupying a nearly horizontal position.

The most recent formation is that of the terrace deposits of sand and gravel, which occur in Sonora.

Having thus given a general sketch of the principal groups of rocks developed in the region in question, I pass to a more detailed description of the different formations.

The preceding lengthy quotation merits the deep consideration of all interested in the mining of gold and silver throughout the American continent, as it is probable that more than nine-tenths of its economically productive auriferous and argentiferous areas are almost identical in character with the description just quoted.

We may conclude this notice of Mexico, by briefly remarking that Mr. Remond describes the carboniferous beds as consisting of thick masses of limestone intercalated with layers of schists—the whole series amounting probably to a thickness of five thousand feet, which at Hermosillo rest on syenitic granite.

In the Triassic group are found beds of coal, some of which has been described as anthracite of superior quality.

MINING INCOMES.—The MINING PRESS says, in its last issue:

"The largest individual income derived from the working result of mining for the year 1865, in California, was that of James B. Pierce, of San Francisco. It came from the Blue Gravel claims near Smartsville, Yuba county, and amounted to \$102,031. Jules Fricot, a Nevada quartz miner, was assessed \$182,511, but we are recently informed that the larger part of his assessment came from the sale of mining ground."

We think the PRESS is wrongly informed as to the larger part of Fricot's income being derived from the sale of his mine. The Eureka mine, of which Fricot was half owner, was sold in October, 1865, for \$400,000, and possession given; but only \$100,000 was paid down, the other installments not being paid until after the beginning of 1866. Reducing the \$50,000 which he received before the 1st of January for the sale of his mine, to greenbacks, he would still have left \$120,000 as the profits of his half of the mine for the year 1865.—*Nevada Gazette*, Nov. 1st.

COAL OIL.—Messrs. Sutton & Alexander have leased the Commercial mine, at Corral Hollow, San Joaquin county, for the purpose of distilling the coal to extract the oil which it contains in unusually large proportions. The necessary retorts and other apparatus are now being made in this city, and the distillery will soon be put in active operation. Experiments made with the Corral Hollow coal show that it will yield from fifty to sixty gallons to the ton.—*Times*, Nov. 5th.

HENRY GEERKE, of Tehama county, has raised thirty thousand dollars' worth of wheat this season.

[Written for the Mining and Scientific Press.]

Sierra County Mines.

BY AN INDEPENDENT CONTRIBUTOR.

[Continued from page 256.]

The evening was pleasantly passed in discussing the merits of some good old Bourbon, divers and sundry pipes of Virginia's best; our host, meantime, entertaining us with the history of his mine, from its discovery to the present time, of which we give a brief account:

THE SIERRA BUTTES MINE

Was discovered in 1851 (a period of excitement). The croppings were bold and very rich, showing free gold. The soil and debris below the vein paid from five to eight dollars to the pan. The news soon reached Downieville (twelve miles distant), which was for a time depopulated. Merchants and miners, lawyers, washerwomen and doctors—horse and foot—all started for the new El Dorado. The whole country was staked off, not even excepting the Buttes Mountain to its crest, and a city (Sierra City) was projected (now consisting of half a dozen houses). The discoverers and first locators of the vein, however, were the only ones that persevered to development. They leased the property to Messrs. Woods & Illingsworth, who, with Mexican labor, opened the mine, and worked the ores by arrastras until 1856, in the meantime acquiring possession, by purchase, of the entire property. By the arrastra process less than thirty dollar ores cannot be profitably worked. The chimney or chutes on which they were working not paying so well, the Mexican employees reported the mine exhausted, and Messrs. W. & I. sold, as they thought, a worthless property for a good price—the equivalent which they received in part being placer ground, which was in reality nearly exhausted, and comparatively valueless. The property sold (the Sierra Buttes mine) has, since that time, paid dividends to the amount of \$870,000, in addition to building costly mills, flumes, improvements, and the dead work of the mine, costing \$430,000. Pretty good for an exhausted mine, which to-day shows nearly a year's ore broken and stored in metal houses, with ores for several years broken up and ready for quarrying in the stopes.

The following morning our host, true to his promise, piloted us through a labyrinth of subterranean workings, showing us huge chambers excavated in the mountain, from which ores have been quarried hundreds of feet in length, and from fifteen to twenty-five feet in height; the mountain supported by an occasional false pillar, formed of surface rock, or by a perfect forest of timber, bare, barkless trees, from two to three feet in diameter, and twenty to thirty feet long. There are but few mines of note in this State that I have not visited, and must acknowledge that I have never seen mining on so magnificent a scale, as at this property.

The ores are not as rich as the small veins of Grass Valley, and without corresponding crushing capacity cannot be expected to yield as well; but the facilities for adit levels, with inexhaustible hacks, avoiding the heavy expense of hoisting and pumping; water in abundance for power; the powerful and extensive body of pay ores, which improve in richness with the depth, are evidences of stability and permanence that the most skeptical cannot fear. I am compelled to agree with the manager that this mine, if not the best, is certainly one of the best in the State.

This property consists of three parallel veins—the Rose, Aerial and Cliff, all powerful veins, varying from eight to twenty-five feet in width, situated on the southerly flank of the Sierra Buttes mountain, distant from crest about 3,000 feet, from South Fork of Yuba River about three quarters of a mile; vertical height above river, 1,519 feet; vertical depth of workings from croppings, 450 feet. The gangue or vein-stone is quartz—variable, laminated, saccharoidal and compact.

Metals.—Auriferous iron pyrites, with free gold, and a little galena and copper.

Laminar—when found in veinstone it is coarse and granulated—yields by simple amalgamation on copper plates, in battery and

sluices, from fifteen to thirty dollars per ton. Concentrated sulphurets, of which there is a large percentage, assay from two hundred to four hundred dollars per ton. Strike of vein west 20° north, magnetic; dip 40° northerly; formation or country rock, highly metamorphosed slate, talcose, serpentine, and silicious.

The machinery consists of two mills, each with twelve stamps, weighing 550 pounds each, with a crushing capacity of twenty-four tons per day. The water-power is supplied by heavy springs making out of the mountain, in connection with an expensive flume costing forty thousand dollars, conveying the water from a lake lying north of Buttes mountain. The cost of quarrying and crushing is \$4.25 per ton.

I have described this property more particularly, as from the length of time which it has been worked, and its extensive explorations, it is the type or representative mine of the group, comprising quite a number of parallel veins lying on both sides of the Buttes mountain, and dipping to a common center. Their characteristics, veinstone and metals are similar, denoting them to have been formed at the same period of igneous disturbance.

THE INDEPENDENCE COMPANY

Is a property of considerable note, being the first westerly extension of the veins previously described. Its characteristics being similar, it will require but a brief description.

The mine was located in 1858. The machinery consists of two mills, with a water-power of thirty-six stamps, and a crushing capacity of thirty-six tons in twenty-four hours; amalgamation the same as at S. B. mine. The three veins unite, forming one of sixty feet in width, with three pay chutes or chimneys. The Easterly vein is 125 feet long; average of ores thirty dollars per ton; the Middle is 200 feet long; average of ores twelve dollars per ton; the Westerly is 300 feet long; average of ore from fifteen to eighteen dollars per ton. The vertical depth of workings is 125 feet. The ores are found to improve in depth.

WOODS & WARREN.

First easterly extension—characteristics same as Sierra Buttes, but vein undeveloped—prospects rich. The vein is traceable in an easterly direction, on its line of strike, for about two miles, and is heavily mineralized. The parallel veins show a good working prospect. A heavy bed of magnetic iron ore lies near the river on the easterly flank of the Buttes mountain.

When the mineral resources of this district are better understood, and when capital and labor are more abundant, it is not unreasonable to infer that the mineral product of this district will be second to none in the State.

This mineral belt of metamorphic rocks, in which the previously described mines occur, stretches away in a northerly direction, defined and traceable for 150 miles; in a southerly direction it is traceable about 350 miles, parallel with the axis of the mountain chain, and conformable to the igneous belt of eruptive rocks, everywhere seen on the summit of the Sierra range.

In a northerly direction, about three miles, we find

THE PRIMROSE MINE,

With a 12-stamp steam mill, now lying idle for want of the one thing needful to render it a productive mine—capital. Its past history and disbursements have demonstrated its intrinsic value, and proven it to be a powerful vein, containing very rich ores. During the few years it was worked the gross product was \$240,000, which was expended in dead work, mills, machinery, and the purchase of other mining properties, leaving an indebtedness of \$72,000 under an exorbitant interest. Had the creditors been able to give an extension, the mine would in a short time have paid the indebtedness; but, unfortunately, the creditors were pressing, and the property was sold under the hammer.

Among the properties of note in this belt we find, three miles northerly, the Gold Valley mine, with a 10-stamp mill, and the Four Hills mine with a 4-stamp mill. In Plumas county, adjoining Sierra, is the Eureka, and at Jamison the Mammoth and Crescent, besides several others at Indian Valley. VIAJADOR.

MUNCHAUSENISM.—The Sonora Democrat of November 3d is said to be responsible for the following: "Some Italians near Deer Flat, in this county, last week struck one of the richest quartz claims that has ever been found in the county. We are informed that at a depth of fifteen feet on the vein they found a streak of pure gold four inches wide, and the quartz being decayed, they take out the precious stuff in huge slabs, which they have to cut in portable sizes with a chisel."

Oh! oh! oh!

*In a paper read at the meeting of the California Academy of Natural Sciences, San Francisco, at their meeting March 5th, 1866, by M. Remond, being an abstract of his observations made in Northern Mexico from 1863 to 1865.

Written for the Mining and Scientific Press.]

The Plattner and Ryerson Processes.

EDITORS PRESS:—In your issue of October 27th, in speaking of the superiority of the so-called superheated steam process over the common mill process, a statement of facts is used as proof, which, though correct in itself, does not give the whole truth of the case.

The reporter says: "The Winton mill, at Meadow Lake, extracted only nine dollars per ton from ore which yielded by the superheated steam process over treble the amount." The full facts, however, are the following: The quartz, containing only about five per cent. of arseniurets of iron, yielded nine dollars per ton in free gold and fifteen per ton in gold extracted from the concentrated arseniurets, making in all twenty-four dollars per ton, though at least one quarter the arseniurets contained in the ore were lost by the imperfect work of hands inexperienced in huddle washing. The yield by old processes followed for years in this State would have been fully as much, if not more, than by this new process. Every now and then we hear of astonishing results by new processes, which, when traced down to the facts, disappear in insignificance.

The fact is, gold quartz milling has been carried on for the last years in greater perfection than any other branch of metallurgical reduction followed in any part of the world, principally on account of its simplicity. A loss of more than ten per cent. of the gold contained in quartz, after a careful separation of the sulphurets or arseniurets, can certainly be considered an exception in any well managed mill.

Fire assays on quartz tailings, as every assayer experienced in this metallurgical branch will admit, will hardly ever be found a guide in working quartz. It requires the utmost care and circumspection in the selection of samples, and in the most favorable cases the endeavor to arrive at reliable and practically corresponding results will prove abortive.

Another writer, speaking of the tailings of the sulphurets found at the Chlorination works at Grass Valley, mentions an assay made by him from one of the piles, giving a result of \$23 per ton. Though this assay indicates a far greater loss than that experienced by men who carry on this delicate process in an understanding manner, it indicates still a flattering result.

The roasted ore is said to yield by fire assay twenty three dollars per ton. This ton of roasted ore is the result of 1.43-1.00 tons of raw concentrated sulphurets, as the sulphurets of iron lose from thirty to thirty-three per cent. in weight by roasting. The loss per ton of sulphurets is, therefore, 23-1.43 = \$16. As the sulphurets of Grass Valley will average about \$160 per ton, we have a loss of only ten per cent. With an additional expense of thirty cents per ton, this loss, or at least the greater portion of it, could be avoided.

A careful and intelligent working by Plattner's process will extract nearly as much as the fire assay, as can be proved by hundreds of controlling assays of various assayers.

In regard to the difficulty of working the Eureka sulphurets at Grass Valley, bought by Swansen agents at present, it only exists in the inexperience of the local sulphuret men in working rebellious sulphurets by chlorination.

The gold contained in the Eureka sulphurets can be saved, however coarse; nor will lime, copper, or a small quantity of lead be a drawback to a successful working of the ore. Unaccustomed to work cupreous sulphurets, the local sulphuret men are unable to treat them.

Smelting the ore at Grass Valley has already proved a failure in 1859, on account of the difficulty of procuring the necessary lead or its ore; and cannot compare in point of cheapness with Plattner's chlorine process, which will be carried on, with slight alterations, in Meadow Lake district, abounding in poorer sulphurets at ten dollars per ton, though the cost of freight on chemicals is quite considerable. Finally, the writer wishes to state that the patent to which reference has been made by one of your correspondents, does not exist on Plattner's chlorine process, but on "a combination of devices and apparatus for working the above process." The patent was issued January 6th, 1863, and the right to construct such apparatus in Nevada county has been bought by the sulphuret men of Nevada City and Grass Valley.

G. F. D.

Meadow Lake, October 27, 1866.

Gov. McCormick's Message to the Legislature of Arizona states the probability that during the coming year Arizona will be placed in telegraphic communication with the rest of the world, by the erection of a branch line from Utah.

Mechanical.

NEW MACHINERY.—Messrs. H. J. Booth & Co., at the Union Foundry, have just forwarded eight 4-foot Wheeler pans for the Rawhide Ranch mine, Tiolumne county, and are now making for the same mine a 12-inch engine, with hoisting gear, etc. They have also nearly completed four 4-foot Wheeler & Randall Excelsior Grinders, for O. L. Chamberlain, for the French Mill, Amador county. There is also in course of construction at this establishment, for Wm. H. Bovey, whose mine is at Angels, Calaveras county, a 10-stamp mill; a hoisting gear for the Alpine company, Greenhorn Mountain, Kern county; a 36 inch engine for the Sacramento City Water Works, with two large pumps of 12-inch bore and 6-foot stroke. The last-named engine will have Scott & Eckart's self-regulating cut-off. Besides the above, the works seem to be well favored with miscellaneous orders.

The latest novelty in the way of destructive weapons, is a French invention by M. Perrot. He has invented three different guns. The first has two barrels, and by the force of compressed air several balls can be projected in one second from each barrel. A cartouch box, containing a thousand balls, by an ingenious contrivance drops one into the bore of the gun after each shot. A second gun has three barrels; from each twenty balls can be projected per second, therefore, from nine hundred to twelve hundred per minute. The machinery of this gun is similar to that of the first, merely that it is mounted on wheels, and therefore is *locomobile*. In the third species, steam, air, and gas are put in requisition to project stone and combustible material of all species, and is intended to be employed in besieging a city or storming a fort.

A SUPERIOR GLUE.—A very superior glue may be made by dissolving three parts of India-rubber in thirty-four parts of naphtha. Heat and agitation will be required to readily effect the solution. When the rubber is completely dissolved add sixty-four parts of finely powdered shellac, which must also be heated in the mixture until all is dissolved. This mixture may be obtained in sheets like glue by pouring it, when hot, upon plates of metal, where it will harden. When required for use it may be simply heated in a pot till soft. Two pieces of wood or leather joined together with this glue can scarcely be sundered without a fracture or tearing of the parts.

THE Legislature of Connecticut passed a law at its last session requiring all railroads through that State to use some kind of an apron between passenger cars. The object is to secure the safety of passengers when going from one car to another while in motion. A contrivance for this purpose has recently been patented by a Hartford man. It consists of an iron net-work, put together by rivets in such a way that it expands and contracts according to the motion of the car. It is highly spoken of by railroad men.

MR. KIRCALDY has recently erected in London a testing machine for steel, which is said to be the most complete thing of the kind. The *Engineer* says: "A preliminary series of 240 experiments will be commenced within the next fortnight. The experiments will be conducted with a view to determine the powers of resistance of various steels, supplied by the twelve subscribing firms, to tensile, compressive, bending, and torsional strains."

LINING FOR STEAM CYLINDERS.—An invention which has for its objects the prevention of the escape of heat from steam cylinders, and the condensation of steam therein, has recently been afforded provisional protection in England. It consists in lining the cylinder with wood or some other material which has a low conducting power.

AN IMMENSE BRIDGE.—The Victoria Bridge over the river Thames, at Battersea, is 912 feet long and 132 feet wide. It is the widest railway bridge in the world. It will have four railway tracks.

SUPERIORITY OF REMINGTON'S FIRE ARMS.—Austria has signified her adoption of an American gun—the new Remington breech-loader—and "all the resources of public and private works are to be employed in its manufacture." The Belgian Minister of War has also applied for permission to manufacture under the Remington patent, while England and France have ordered additional samples with which to complete their trials of the same.

The invention mainly consists in the application of a swinging breech-piece, pierced by a firing line, to a barrel bored "through and through," and acting in combination with a tumbler attached to the hammer, so that the curved edges of the tumbler and the breech will interlock to brace against the recoil. This gun has shown greater rapidity of fire than any other, exceeding even sixteen shots per minute; and it claims superiority in the additional requisites of accuracy, extent of range, portability, durability, simplicity for purpose of cleaning and repair, safety and convenience of handling in action, and cheapness of construction. While this is likely to be the standard pattern for new guns, there is a desire on the part of our Government to avoid for a time the expense of an entire new piece by altering to breech-loaders the Springfield rifles now on hand. The Remington plan for this purpose is also before the public.

THE *Colliery Guardian* of Sept. 22d, thus speaks of a patent recently granted for "improvements in making wrought iron":

The process to which this invention relates, is intended chiefly for the treatment of such ores as the rich primitive oxides and hydrated oxides of iron, but other ores may be subjected to it. Ores to be treated are to be pulverized to about the size of peas, and to have the mechanically mixed earthy matters and other impurities washed out or mechanically separated; the ores are then to be mixed with sufficient charcoal or other carbonaceous matter to deoxygenize them, and the mixture, either with or without the addition of fluxes, is to be charged into iron canisters, by preference of sheet iron perforated with a few holes. The canisters thus charged are to be submitted to a proper heat to deoxygenize the ore in any proper furnace; the heat is then to be raised to a welding heat, and the canisters, either broken or unbroken, together with their contents, are to be partially welded together in the furnace and then withdrawn, and subjected to the action of a hammer, squeezers, puddle-ball, rods, or other proper instrumentality to solidify the mass and complete the welding.

An invention has been provisionally specified by a London artisan, which consists in so connecting the bodies of railway carriages to the under frame-work, that in case of a collision, the two will be separated by the breaking of a bolt. By this means, the shock which passengers receive is broken. The body of the carriage slides forward in grooves on the frame-work, and thus is much less likely to be demolished than if the check was more abrupt.

A NEW YORK ENGINEER has planned and is about building a river steamer, constructed entirely out of Bessemer steel, the length to be 450 feet, the breadth 45 feet, and the displacement 1,760 tons. By constructing the steamer upon a peculiar model which he has planned, the engineer claims that with engines of 10,000-horse power he can secure a speed of at least 30 miles an hour. The boat will accommodate 1,000 passengers, and is to run, if successfully built, between New York and Albany, making the trip in five hours.

A CURIOUS INVENTION BY A WORKINGMAN.—At the Industrial Exhibition in the Agricultural Hall, Islington, London, there is shown an ingenious invention, by which the action of a shower of rain is made to close an open window. The window, when opened, stretches two India-rubber springs. These springs are prevented from drawing the window down by means of a curved rod fixed outside the sash, the end of which works up and down in a tubular bell-mouthed stand on the window-sill. A little piece of loaf sugar is inserted into the mouth of the stand, and the end of the rod is let down gently upon it. The sugar prevents the rod descending into the tube, and of course keeps the window sash up. As soon as it begins to rain, the bell-mouth of the tube collects the drops, the sugar is melted, and no further obstacle being presented to the action of the India-rubber springs, the sash is drawn down.

BARRELS FOR CEMENT CRUSHING.—Experiments are about being made for reducing hard cement in revolving barrels, or grinders. The barrels will be made of sheet iron, with hollow journals for introducing steam for the purpose of accelerating the process.

Scientific Miscellany.

CHARCOAL AS A PRESERVATIVE OF WOOD. The enduring character of wood which has been charred is well known. Charcoal itself is as enduring as granite; but its use in preserving wood is generally misunderstood. The cause of its preservative influence does not lie in itself, but in the fact that the heat required to produce it destroys the parasites which would otherwise destroy the wood. Wood subjected to a high steam heat, though not charred, is as capable of resisting the action of time as though it were charred. Dr. Schmoele has recently taken out a patent founded on this principle, which he sets forth as follows:

The microscope reveals the cause of decay in wood as due to parasites feeding on the albuminous substances therein. The following conditions must all be fulfilled before decay takes place: The presence of parasites or germs, albuminoids, moisture, free oxygen, together with a suitable temperature, and the absence of greater counteracting influences. Now, charring wood dispenses with the two first conditions, for the heat required to char the outside coating is more than sufficient for decomposing the albuminous substances, and destroying all parasite germs. A temperature but little above the boiling point would answer for this equally well. I come then to the conclusion that, for preserving wood, charring is quite superfluous, a much less heat answering equally well. On this idea, original I believe with myself, and which I claim as my invention, I base my plan for the preservation of wood. I propose to store the timber, of whatever description, in large stone or iron boxes or rooms, through which I circulate currents of hot air or superheated steam, till each piece is heated to the required degree.

This process offers the following advantages: greater simplicity, greater cheapness, requiring no expensive chemicals, greater expedition of the work.

As is well known, the albuminoids are highly hygroscopic, and in consequence expand or contract with every change of moisture in the air. Wood treated as above is no longer subject to such changes.

PHOTOGRAPHING UPON SILK.—A process has been devised at Lyons, the great silk manufacturing locality of France, for photographing upon silk, linen, etc., so that persons, instead of marking their initials upon the corner of a handkerchief, can have their photographs taken upon the fabric. In the silk shops various articles are exhibited, photographed with names, portraits and fanciful devices. The pictures are not injured by washing, and the process is said to be easily and rapidly effected.

CARBOLIC ACID is coming into general use as a disinfectant. Its action is prompt and persistent. Chloride of lime deodorizes the air, but destroys the noxious matter by chemically changing it, at the same time becoming itself changed and useless for further good. Carbolic acid does not change; while it acts as promptly as the chloride of lime, it continues indefinitely to act.

SNOW is never familiar in its aspect. It seems to belong to the world of ghosts. It is the opposite of verdure, of plenty, of life, and speaks sublimely of desolation, of cold, of death. This gives it supernatural affinity. Childhood is deeply impressed with a fall of snow. Ostensibly occupied with extraneous, with form and color, the deeper Being of infancy is amenable to the vastness and awfulness of the snow-storm.

The beauties of the snow-drop, microscopically viewed, match the superb grandeur of the snow-fall, and it is instinct with life when examined. A distinguished chemist, in an experiment, examined water in a vessel, and found it to be pure; snow was then dissolved in it, and under the microscope the liquid was found with hundreds of animalcules resembling diminutive shrimps, and quite unlike the eels discovered in acetic acid. Snow-water is considered unwholesome; the affections of the throat in parts of Switzerland are attributed to its use. The snow-drop rivals the star in beauty, and, like the star, is a world full of life.

DISCOLORATIONS OF THE FACE are generally produced by the accumulation of pigment under the cuticle, caused by indigestion. The trouble may be removed by dissolving half a teaspoonful of common salt in a tumbler full of water, and drinking it every morning before breakfast. So says the *Druggists' Circular*.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 10th, 1866.

Since our last reference the demand for money for regular business purposes has been less pressing, and a slight accumulation of available capital may be noted. The rates in Bank upon first-class paper and other good collaterals are ruling at 1¼@1½ per cent. per month. Upon the street higher figures prevail. A revival of speculation in mining shares, upon the arena of the Stock Exchange, seems to have been fairly inaugurated, owing to the unusually favorable advices from leading claims. There can be but little doubt that the intrinsic value of certain mines has been materially enhanced within a short time, giving strong evidence of future permanence.

Gold Bars sell at \$40, with some inquiry for steamer account. Silver Bars rate at 1¼@1½ discount on average lots. Currency Bills on the Atlantic are given at 40 per cent. premium on gold. Sight Drafts, payable in coin, are made at 2¼ per cent. premium, and Telegraphic Transfers at 2½ per cent. premium. Sterling Exchange sells at 48¼@49d.; Commercial do., 49@49½d.

During the past week City Stocks have revived a little. San Francisco Gas Co. sold at 66@65 per cent., Spring Valley Water Co. at 61 per cent., and California Steam Navigation Co. at 68 per cent.

Latest Gold quotations from New York, 146; Sterling at 109. Legal Tenders, 70½c bid, 70½c asked.

The transactions at the Stock Board during the past week have been considerably in excess of the previous week. Several leading stocks have materially improved, and as a general thing marked firmness prevails in the Share Market. A number of claims are now yielding largely, and their present condition is such as to insure the belief that they are not likely to become less productive for a long time to come. Most of the Washoe companies on the Comstock lode are financially in a good condition, and no diminution is apparent in bullion returns. During the month of October the receipts of the following companies—Savage, Yellow Jacket, Hale & Norcross, Gould & Curry, Crown Point, Imperial, Chollar-Potosi, Empire Mill & Mining, and Ophir—aggregated nearly \$1,000,000. The September returns reported about the same amount, while in August the receipts exceeded the above figures. The usual monthly dividends have been declared, as will be noticed in detail below.

Savage sold in the beginning of the week at \$1,410, advanced steadily to \$1,475, then sold at \$1,460, closing at \$1,430, ex-dividend. The yield of ore from this mine during the week ending November 3d was principally from the sixth station, which produced 947 tons, and the works in the Curtis shaft yielded about 650 tons. The ore found at the southeast face in the sixth level has improved, it is said, both in quantity and quality. Winze No. 2 from the same level is now over fifty feet deep, and continues in the same ore as previously reported. During the month of October \$210,000 in bullion was received as the production of the mine for that period. In September the yield was about \$145,000—an increase of \$65,000. The ore gave an average production of \$45 per ton—in September, \$41. Over 2,700 tons of ore remain on hand at the mine, valued at \$124,000. A dividend of \$75 per foot was declared on the 8th and paid yesterday. This company carries forward a cash surplus of \$23,000 after paying out \$60,000 in dividends.

Hale & Norcross has not been dealt in during the past week. On the 9th, \$1,750 per foot was bid. The bullion receipts of this company during the month of October amounted to \$149,931 63. This is 65 per cent. of the assay value exacted from the millers; but the actual result after working is given at \$152,363.74. This amount is produced from 2,588 tons of ore, giving an average of \$58 per ton. The September returns of bullion, at 65 per cent., aggregated \$150,719.49—actual yield, \$2,947.17 more; August, \$118,000—actual yield, \$1,447.38 more; and in July, \$139,883—actual yield, \$14,800 less. A dividend of \$100 per foot, it is said, will be declared to-day.

Yellow Jacket opened at \$670, advanced to \$700@725, receded to \$690@685, and closed yesterday at \$690. From the report for the month of October we learn that this company has worked 6,684½ tons of second class ore, yielding in bullion \$180,288.67, or an average of \$26.97 per ton. The total receipts from all sources for the month are given at \$188,216.85, and the legitimate expenses of the mine at \$168,171.64. The October balance at the credit of the company is stated to be \$174,367.35, while that of September was \$221,643.62. On the 8th, a dividend of \$50 per share was declared, payable on the 15th instant.

Gould & Curry is quoted at \$450 bid and \$525 asked. During the month of October this company realized \$114,321.67 in bullion; in September, \$117,821.35. The production of the mine for October is stated to be about 5,900 tons of ore; of this amount 3,400 tons were delivered at the company's mill, and 2,200 to custom mills.

Crown Point sold at \$1,085 early in the week, receded to \$900, and at the close \$920 is asked. During the month of October, 3,205 tons of ore were reduced, yielding about \$110,000 in bullion. This gives an average of \$34 per ton. The yield in September was reported at \$120,000, and the average over \$38 per ton. In the drift on the lower level the east and west strata have been united. The vein at this point is said to be somewhat irregular in its formation.

Chollar-Potosi opened at \$119, advanced to \$126.50, declined to \$107.50, suddenly rallied to \$130, and closed yesterday at \$190. The bullion yield of this company for October is about \$60,000; in September it was \$53,000. The new Santa Fe station, it is said, looks well, and so does the Bajazette—the latter carrying a large amount of low-grade ore. The rise in this stock at the close is attributed to rich developments in the new shaft.

The Bacon Mill & Mining Co., at Gold Hill, have resumed operations. An assessment of \$10 per share was levied on the 10th inst. Imperial has met with no material change from our last quotations, selling at \$104@108, then at \$106, closing yesterday at \$106½. This company, it is said, is now extracting more than the usual quantity of ore for winter supply.

Empire Mill and Mining Company opened at \$120, receded to \$112, and yesterday \$106 was bid. The bullion receipts for the month of October, we are informed, aggregated about the same as in September—\$42,000. On the 9th, a dividend of \$6 per share was declared. Ophir sold at \$91@92.50, receded to \$79, and closed at \$82.50.... Belcher advanced from \$60 to \$67.50, buyer 30, then sold at \$62, closing at \$62 asked.... Confidence sold at \$58.

Bullion brought \$12.50@19, buyer 3—assessment of \$10 delinquent.... Sierra Nevada sold at \$3.25—assessment of \$2.50 delinquent.... De Soto, \$3.75@3.25.... Daney, \$2.25.... Overman was largely dealt in during the past week within a range of \$23@14, closing yesterday at \$18½. Assessment of \$5 due November 17th.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$478,301.50.

THE PARIS EXHIBITION.

MEETING OF THE CALIFORNIA EXECUTIVE COMMITTEE.

The Paris World's Fair Executive Committee met on Saturday afternoon last. Dr. Pigne Dupuytren stated that Mr. W. B. Ewer, the President of the Committee, was absent from the city, and had resigned his position as Commissioner for California to the Paris Exhibition, and that Professor W. P. Blake had been appointed in his place by Governor Low. Professor Blake, by virtue of his appointment, was thereupon elected President of the Committee, and took the chair.

LIMIT OF TIME.

It was stated by Mr. Weill that all articles intended for exhibition at the Fair, if sent to New York, must be forwarded so as to reach that city by the first day of December next. This would preclude any further contributions from this State through that channel. Application has been made to the agent of the French line from Aspinwall to St. Nazaire, France, to ascertain if he would forward, free of expense, such articles for the Exhibition as the P. M. S. Co. should deliver to them on the same terms. No answer had been received; but the opinion was expressed that the Company would cheerfully accede to the proposition, of which public notice will be given. Goods may thus be sent from this city as late as January 5th.

WHERE TO SEND ARTICLES.

Articles intended for the Exhibition should be sent to the care of Jacob Deeth, No. 205 Sacramento street, in this city, except those, minerals donated to the French school of mines, which should be forwarded to Dr. Pigne Dupuytren, 1,022 Stockton street. Parties having goods which they may desire to exhibit, should notify Mr. A. S. Evans, the Secretary of the Committee, as early as possible, stating the amount of space required, character of goods, etc.

Mr. I. N. Hoag, Secretary of the State Agricultural Society, was added to the Committee, and a sub-committee, consisting of Prof. Blake, Alex. Weill, Dr. Dupuytren and C. W. Brooks, was appointed to publish an address to the people of California, in relation to the Exhibition. That address has since been issued, from which we extract the following:

To the People of California:—The structure for the Industrial Exhibition to be opened at Paris on the first of April next, will be elliptical in form and cover thirty-six acres of the Champs de Mars. This space will be divided into ten annular parts running concentrically with the outside lines. These are again divided radially by passages extending from the center to the outside. All the pursuits and products of man are grouped in ten leading divisions, as follows:

1. Works of Art.
2. Materials and applications of labor to Art.
3. Furniture and other household articles.
4. Clothing, including cloths and wearing apparel.
5. Mining, and the rough and wrought products of mining.
6. Processes of Mechanic Arts.
7. Food, fresh and preserved, in its various states.
8. Lending Agricultural products and specimens.
9. Natural Horticultural products and specimens.
10. Objects especially exhibited for improving the physical and moral condition of the population of the earth.

The objects falling into each of these ten comprehensive divisions will occupy one of the ten annular divisions of the building, and a section of the whole, extending from the center to the outside, will be assigned to each nation, so that a connected view of the industry of the world may easily be obtained by visitors.

Forty-two thousand square feet of this space has been assigned to the United States, or over six times the space heretofore allowed us in other exhibitions. Eight hundred feet of this space is allotted to California.

The opportunity is thus offered to us to exhibit to the world in a striking and effective manner the character and abundance of our material resources, and the condition of our arts and manufactures. The people of the State should gladly avail themselves of this opportunity, not only with a view of enhancing their own and the State's prosperity, but to discharge a duty which we clearly owe to the great family of nations, and the advancement

of science, art and civilization. We should exhibit not only for our own direct profit, but we should for the benefit of the millions less favored than ourselves, who will crowd the avenues of the exhibition, anxious perhaps by seeing to learn something of this far-off El Dorado. It has been well said, "The products of industry constitute the language of labor." The artisans and laborers of Europe if unable to read, may, by seeing, learn what we have, and what inducements there are for them to come to us. We can show to the middle and industrial classes of Europe what materials we have in our hills and valleys, ready to be extracted, forged and woven into the various shapes useful and profitable to man. We can show to foreign capital evidences of the treasures that lie dormant in our mountains for want of the means to extract them, or of cheap transportation. We can show them, in short, that we have the material basis of a future greatness and prosperity that will far exceed the wonderful realization of our short history.

Let us then unite in an effort to make the representation of this State worthy of the Exhibition and of ourselves. Let us send characteristic and full samples of all our raw materials; specimens of our ores of gold, silver, copper, lead, tin, iron and other useful metals; samples of our combustibles, our coals, bitumens and petroleum; samples of our borax, horacic acid, our sulphur and our clays.

Let us have our cereals represented not only by the clean grains, but in the ear and stalk. Let us have samples of the wines and brandies from all the vineyards of note from one end of the State to the other. We want specimens of our native woods, of our wool, cotton, silk, flax and hemp, and the manufactures from them. All our manufactures, especially those based upon our raw materials, should be fully represented. Let us have, if possible, models of our mining machinery, of our pumps, improved stamp batteries, appliances for saving gold, and our gridding and amalgamating pans. It is desirable, also, that some of our unrivaled specimens of the photographic art, especially in the form of views of our grand mountain scenery, should accompany the representation.

Much has already been accomplished by the State Agricultural Society, through their Secretary, I. N. Hoag, in securing and sending products of agriculture and samples of our wines. The Mission Woollen Mills will send a full suit of blankets, cloths, cassimeres and flannels. A large plank from our forest is promised, and we may obtain a section of the stump of the Big Tree. Through the exertions of Dr. Pigne Dupuytren, a large number of specimens have been brought together and classified, which will be sent forward.

Much of the precious space at our disposal is yet unfilled, but although it is now too late to send contributions to the agency in New York, articles that may be sent to the care of the Committee here will be received and forwarded direct, if sent to us not later than the fifth of January next.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the Mining and Scientific Press, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1886.

CHANGING THE ADDRESS.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the Mining and Scientific Press from Mr. ... at P. O. ... County, ... State, to Mr. ... at P. O. ... County, ... State, 186-"

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the *Miner* of November 3d: The Mowyer tunnel have struck through the hard rock they have been encountering lately, and cut a small vein of exceedingly rich black sulphure ore. Work is again commenced in the Boulder Hill. Mr. J. B. Scott has secured control of the old Pioneer location, and also of the old Scott's Hill Consolidated Tunnel, and is now building a house at the mouth of the tunnel, preparatory to commencing work. It is the intention to make a turn in the tunnel to the left, expecting to strike the celebrated Pioneer lode in from 100 to 150 feet.

Mr. E. L. Hoxey, who recently visited Alpine, and is one of the principal owners in the Mowyer claim, secured while here several mining properties which he will offer to friends in Illinois, and, if possible, get capital interested in for the purpose of opening and developing them. Among these claims are the Leviathan, Aurora, Summit, and extensions of the Mowyer and Mahogany.

Amador County—

From the *Ledger* of November 3d: The Pioneer claim is situated about one-half of a mile north of town, at the foot of the hill on which the Kennedy mine is located. The company are endeavoring to strike the Kennedy lode by running a tunnel. They are now in about 800 feet, and have got through the hard granite, and will undoubtedly soon reach the vein.

Meader & Co. have conditionally purchased the Blue Jacket mine. This is the first north extension of the Coney, and is owned by Messrs. Little, Dunning & Burwell. They have a shaft down about thirty feet. The rock is very good, and will, undoubtedly, prove to be a very good paying mine. Meader & Co. are to have until the first of April to prospect it, and in the meantime they are to sink a shaft one hundred feet deep on it, and if it proves to be what is now supposed they have the privilege of purchasing it at a price already agreed upon by the parties.

Calaveras County—

From the *San Andreas Register* of November 3d: Cave City, after passing through a trying ordeal, is again reviving. Good diggings have been struck by some of our enterprising Chili Gulch neighbors, and great things are expected so soon as the rains come.

Since the above was put in type, we learn that the Gold Hill company have excellent prospects. They sunk a shaft on their claim ninety feet in depth, and have been running a tunnel three hundred feet in length from the bottom, working a gang of men from each end, who are expected to come together to-day, when their mine will be in working order.

From the *Chronicle* of Nov. 3d: Horehner, Myers & Co. are steadily pushing forward work on their claim near Middle Bar. Their tunnel is now in about sixty feet, and has been run directly on the lode. The vein averages about five feet in width, and all the rock prospects exceedingly well. It is the intention of the company to have about fifty tons of the rock crushed at the mill below Middle Bar, and if it pays anywhere near as well as prospects indicate, steps will be immediately taken for the erection of a mill on the lead.

Myers, Wesson & Co. are still at work on their claim in Jackass Gulch. They have sunk a shaft about forty feet in depth, and are still going down. The lead is wide and the rock all contains gold.

Work has been suspended on the Sulphuret claim, in Dutch Gulch, for some reason. A shaft has been sunk on this lead to the depth of a hundred feet, and the vein, which is about twelve feet in width, is an almost solid mass of gold-bearing sulphurets.

Wallace, Cockley & Co. have developed one of the best leads in the county, at Whisky Slide. They have sunk a shaft a hundred feet deep, and at that distance from the surface the lead is a solid, well-defined mass of rich quartz, averaging seven feet in width. We have been shown some of the rock, all over the surface of which the precious metal was visible.

Humboldt County—

From the *Times* of October 27th: Further operations in boring for oil are about to be prosecuted in this county. At present the only well being put down is the Irwin Davis, which has attained the depth of something over 1,300 feet. We are now informed that the Union Mattole company have determined to resume operations on their land. The steam machinery of the Jeffrey company has been procured, and is to be set up and put to work immediately.

Kern County—

From the *Valhalla Courier*, Nov. 3d: In the Rio Bravo Mining District, situated in the southwestern part of this county, and en-

bracing a large part of Lower Kern river, Messrs. Jewett, Bull & Poe have found several lodes, which are thought will prove valuable upon working, as they all contain free gold in the surface rock. One of them, the General Washington, is three feet and a half wide at a depth of eighteen feet, and it is thought will justify a ten-stamp mill. It is being developed as fast as possible, two shafts having been sunk on a line with the lode, and the rock found good all through. A tunnel is almost finished to cut the lode at about seventy-five feet below the surface. When completed it will be about one hundred feet in length. There is plenty of wood and water and a good mill site close at hand. They have two arrastras completed to work the rock as they sink the shafts, and it is thought that the rock so worked will pay all expenses of the mine. Several other parties have been prospecting in this District, and most of them have found and located lodes which they intend working the coming winter.

The new mill of the Mammoth Company was started up on the 1st inst. It has twenty stamps, and is propelled by water power, the wheel being a horizontal iron one, six feet in diameter, with central discharge. Everything worked to perfection. The mill can crush from twenty-five to thirty tons of rock per day, and has an abundance of paying rock for years to come, from the famous old Mammoth mine, situated about one mile distant.

Nevada County—

From the *Gazette* of 3d November: We learn that extraordinary rich ore is now being taken from the incline on the Pennsylvania Company. It is composed mostly of sulphurets, assays of which have yielded over \$2,000 a ton. The ledge is now about a foot and a half in width, and the prospects more favorable than ever before.

Same of 7th: The Ancient Channel Blue Gravel Company commenced operations at Bear Valley last week. They have started a shaft four by twelve feet, which they intend to sink to the bed rock, having an over-shot wheel and using water-power for hoisting and pumping. The shaft was started at the edge of the valley, and after passing through the surface dirt which had washed down from the hills, they struck a bed of lava cement of eight or ten feet in thickness. Below this, they found a deposit of washed gravel, and on Saturday last, at a depth of about twenty-five feet, they struck a granite boulder covering the entire bottom of the shaft, which they will have to blast through. The shaft is substantially timbered and secured as they go down.

From the *Grass Valley National*, Nov. 3d: From 270 tons of rock from the New York Hill Mining Company's ledge, near this place, we are informed that the snug little sum of \$14,500 was realized after crushing. The Murphy ledge, located on Union Hill, is owned by Colonel W. O. Sidney, who has an agent to work it. The ledge was first struck in a tunnel 130 feet from its mouth, and is from one to four feet wide. Rock has been taken from this ledge which paid as high as \$50 to the ton. A new incline is now being sunk.

From the *Union* of Nov. 2d: A strike of rich gravel diggings is reported on the range between the south side of Deer Creek and Quaker Hill, about ten miles above Nevada. A company recently struck the lead, which is about nine feet in depth, and they found the gravel very rich. Four pans of dirt prospected \$38, some of the gold being coarse.

From the *Transcript*: Another new mining district of immense richness has just been opened near the Cascades on Deer Creek. The deposit is nine feet in depth, and prospects immensely from top to bed rock. From four pans of dirt they took \$38, some of the lumps being worth \$4. The channel is supposed to be a continuation of the great blue lead of Little York township, but the gravel is loose and of a reddish color. Some 7,500 feet have been located on the line of the channel.

A company have lately resumed operations on the Wagoner lead, which is located on Piety Hill, and have struck a ledge which is some five inches in width, and is said to be very rich in sulphurets. The company have their tunnel in some 80 or 90 feet, and it is said to be the opinion of those at work in the tunnel that the main ledge is not far distant.

A man named Murchie has struck a rich ledge on what is supposed to be the extension of the Big Blue Ledge. The new ledge is located about one-eighth of a mile from Deer Creek, and is worked by a tunnel. The ledge is about two feet wide, with walls as clearly defined as the walls of a brick building. The rock is decomposed, containing a large amount of ochre, and is filled with fine free gold. Mr. Murchie is now engaged in working out the ledge from the level of the tunnel to the surface.

EXCELSIOR.—The Meadow Lake Sun gives a statement of the bullion shipped by the different mines of that township during the month of October. The total amounts to \$6,674.78, of which the U. S. Grant sent

\$4,750, the Mohawk and Montreal \$1,294, and the remaining \$630 by the Enterprise, Wisconsin, Gold Run, Eclipse and Empire companies. The U. S. Grant and the Mohawk and Montreal appear to be the only mines in the district that were regularly worked during the month.

Three tons of rock from the Empire mine, Meadow Lake, was lately taken to Nevada, and will be crushed in one day or two at Palmer's mill. The Peacock Copper, Nickel and Cobalt Company, recently incorporated, with a capital stock of \$675,000, is to work the Elwell Ledge, Meadow Lake district.

Plumas County—

Correspondence of the Marysville Appeal, dated Nelson Point, Oct. 31st, gives these items: Murken & Co., on Nelson creek, in their last shift, have averaged \$4 per day to the hand. They have got nearly all their gold, thus far, out of tailings—pieces from \$1 to \$3, in early times, having been run through the sluices from the high bars. They have a 12-foot back, which requires so little picking as to keep the men shoveling most of the time. They work seven men, and then cannot keep the derrick always busy. Jimmy Canavan, who is working close to the "Point," and wheeling his pay dirt fifty yards, is making wages.

Messrs. Jackson, Jelly & Mitchell propose putting up another hydraulic with 400 feet of iron hose, and are, with that exception, ready for the rains. Hardy's claims have not been worked "successfully;" nor have they paid common wages for the last three years. Richards & White, the Deep Hole Company, have abandoned their claim. They have spent the whole season, considerable money, and have received no returns.

There has been considerable excitement within the last two weeks in regard to some, said to be rich diggings in Long Valley creek, about twenty miles above here, on this river. It has been reported that Pearson & Co., got nine ounces off of a piece of bed rock eight feet square. But I have conversed with men who worked on the creek before, and they say \$4 per day was the most that they ever made. I have also heard that those nine ounces were the product of nearly as many weeks' labor, and they not having made much over a dollar per day while gathering it.

Sacramento County—

From the *Folsom Telegraph*, Nov. 3d: Within the limits of Sacramento county, discoveries are being made, which if the leads continue as they have, will cause a furor in mining operations in the foot-hills. In all mining operations throughout the foot-hills, within a radius of ten miles of Folsom, the miners have worked to what they supposed to be the bed rock. On Maine Flat, opposite this town, on Negro Bar, on the Flat upon which Folsom is situated, at Texas Hill, Alder Creek, Prairie City and Willow Spring Hill, they call the bed rock lava; but in the flat at Folsom, this is evidently a marine formation, its thickness being unknown. It is filled with sea-shells, and seems to have been a deposit of mud. Through the action of time and other causes this has hardened almost to stone, but is easily worked with the pick.

In all of the above named diggings this appears to be the character of the formerly called bed rock. Beneath this bed rock, on Maine Flat, five companies are now at work in hard cement, which contains no kind of stone or rock except quartz, in pieces varying in size from the smallest pebble to the size of a man's head, which is said to contain fine gold. The miners are working upon the granite, and find it sloping downward beneath the high hills, and the cement upon it increasing both in thickness and richness, until it some claims it is twelve feet thick, with old lava bed rock above it. The gold taken out is of a rusty color, coarse and irregular in shape, like gold found in quartz rock. It is not smooth or water-worn, and the miners insist that it is an original deposit. The channel is much lower than the bed of the American river.

On the Folsom side of the river the cement has been struck within the last two weeks, the streak being now about eighteen inches thick and increasing with the granite pitching. The same kind of cement has been discovered at Mississippi Bar, and will be prospected. The belief generally prevails that a new era in mining has opened in the foot-hills, which will bring to light claims far richer and more extensive than any heretofore worked. We have seen, during the past week, cement that paid as high as a dollar and a half to the pan.

Shasta County—

From the *Courier*, Nov. 3d: At South Fork, work on the Chicago is temporarily suspended. The lode shows splendidly in the shafts and tunnels. The Big Central shaft has been tapped by a tunnel and the water let off. Work now goes bravely on, with prospects as good as in the Chicago. The Crystal Company have not yet commenced operations, but are getting ready as fast as possible.

The Pacific Company have completed an arrangement with Mr. Hawley, from the Ne-

veda county mines, to run a tunnel to the ledge, striking it about one hundred feet below the croppings on the surface. The company give nine hundred feet of the original claim for the work.

In Middletown, the Tornado Company, after piping with a 22-foot head against a bank of about the same height, with very little profit to anybody except the ditch company, ran two drifts, each about thirty feet in length, placed therein a few kegs of powder, and touched it off. The effect was satisfactory. A large amount of earth was thrown down in such a shape as to be easily washed. Blasting will be continued.

The Mammoth Company cleaned up on Saturday last, with very satisfactory results, the rock yielding on an average \$17 per ton. Their previous run worked an average of \$25 per ton. At French Gulch, evidences of prosperity abound. Quartz pays; Gartland & Co.'s placer claims pay; Souter & Co.'s claims pay; and all branches of industry thereabouts pay.

Sierra County—

From the *Downieville Messenger* of November 3d: The Masonic diggings at Allegheny are paying remarkably well. The Greenback mill, on Kaneka Creek, is running, and report says is doing well. Fac Simile, at Allegheny, is prospecting finely, and the tunnel is being pushed ahead. The Union Quartz company at Allegheny have out about fifty tons of fine ore. The Keystone Gravel company, at Minnesota, cleaned up, after a run of two weeks' working six hands, the sum of about \$1,600. The Mammoth ledge, at Sailor Ravine, has been sold to Joseph Clark for the sum of \$12,000. Some time since this claim was conditionally sold, but the parties failed to come to time. Machinery will be erected immediately for working the mine.

John Billings, at Virginia Flat, six miles above Downieville, took out of a crevice in eight days and a half the sum of seven hundred and eighty-nine dollars with the work of two men. The gold was found in a crevice about five feet wide by nine feet high, and paid from the top down. It paid evenly and well for two months, when the crevice became exhausted. The best pay found was about four feet above the bed rock.

In the Slug Cañon Quartz mine the works have, until recently, been idle for more than a year. Recently, in the main tunnel, not more than twenty feet from the mouth, a ledge several feet wide has been found, which prospects remarkably well. The rock taken out is mostly decomposed, and easily mined and milled. A force of four men are at work, and already ten or twelve tons of ore are in the dump house. Good judges estimate the ore to be of a quality that will pay from twenty to twenty-five dollars per ton.

Independence Quartz company, at Sierra Buttes, are running a westerly adit level on the vein, a very rich rock, with 120 feet back. Shaft is down forty-eight feet, and the ore improves as the shaft progresses. Keystone is quarrying rich rock. The edit level is rapidly progressing. The mill is not running, owing to a scarcity of water, which difficulty will be obviated when the edit level reaches the vein.

Montpelier company is crushing Sailor rock with good results. The rock is paying about eighty dollars per ton. Their new flume is approaching completion. The Good Hope company are custom crushing at the Gold Bluff mill, rock averaging thirty dollars per ton. The Page ledge, in Sailor Ravine, has been purchased by Clarke & Co., of San Francisco, for \$12,000. Johnson & Co., southerly extension of Page ledge, have struck the vein six feet wide, with rich prospects in several places on the line of their claim. Mexican company, at Downieville, have had a test crushing made at the Montpelier mill, which yielded twelve dollars per ton fine gold. The concentrated sulphurets assay at the rate of \$830 per ton. A quantity of rock from the Oro mine was recently crushed at the Montpelier mill, resulting in a yield of twelve dollars per ton. This was average rock, taken from five different places on the vein, which is sixty feet wide.

Parties from San Francisco are negotiating for a purchase of the American Hill mine, in connection with a rich deposit of cemented gravel in an extensive ancient river channel, covered a hundred feet deep by basaltic lava. This deposit of gravel is about forty feet deep by seven hundred feet wide.

Bear Valley correspondence of same gives these items: An assay of General Grant rock, taken from the depth of seventy-five feet, showed one hundred and fifty dollars in silver and forty-seven dollars and six cents in gold, making a total of two hundred and three dollars and six cents. The Enterprise have sunk a shaft down on their ledge and have commenced drifting. They expect to reach the ledge in about one week. The Hamilton company have sunk a shaft on their ledge to a depth of forty feet. The Lady Ellen company, the second southerly extension of the Sugar Pine ledge, have stripped their ledge

across; it is thirty-four feet wide, and they are sinking a shaft down upon it.

Yuba County—

From the Marysville *Appeal* of November 6th: Our correspondent at Brown's Valley sends us the following: "The new engine and machinery on the Jefferson claim started last week, and everything seems to be working nicely. They are taking out daily and crushing a large quantity of good quartz. The shareholders may again look for their ten if not for twenty dollars monthly dividends. Work is progressing on the Pennsylvania mill and claim. The new mill and machinery will be ready and in running order at the end of this month. Its prospects have never been brighter. I see people doing some work for the Pacific Mining company. I also observe some movement around the Dan. Webster claim. I learn, however, that before this company start to work seriously, it will cause to be segregated a certain portion of other ground belonging to absent parties."

Washoe—

NEVADA.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the Gold Hill *News*, Nov. 2d: Yesterday we took a trip around among the mines in lower Gold Hill. At the new works of the Yellow Jacket we found they were hoisting out fine looking ore. The Kentucky mine are hoisting through the shaft of the Yellow Jacket a large amount of good ore, which is deposited in the lower dumps. The same company are also hoisting ore through their own shaft. The new hoisting works of this company are now almost completed. The Crown Point has never taken out more nor better ore than at the present.

Some of 3d: The Alpha mine, Gold Hill, has suspended operations for the present, not because of bad prospects, but for the reason that, being some one hundred feet deeper down than any other mine in the Hill, they had such a large body of water to contend with that it was next to impossible to do anything toward developing the mine at the 800-foot level. The indications in the Alpha are extremely good. The time is not far distant when the new shaft of the Empire and Imperial will be down to an efficient depth to drain all these mines. As soon as that time arrives we may look for all the mines of Gold Hill to be in full operation.

An evening or two ago we saw a large silver brick in the assay office next door. Its weight was one hundred and three pounds, and its value upwards of six thousand dollars. It was one of nineteen bricks jointly owned by the Imperial and Crown Point—the total weight being upwards of fourteen hundred pounds.

From the Virginia City *Union*: The Empire and Imperial companies, at Gold Hill, have sunk their new shaft 650 feet, at which point a fine body of ore has been developed. It is their intention to keep on sinking until they attain the depth of 1,000 feet. The Chellur-Potosi is engaged in sinking its shaft, and is now down 640 feet at the new works. The Savage Company is still working down with the intention of reaching 1,000 feet before stopping. The Gould & Curry Company are now engaged in erecting heavy machinery at the Bonner shaft on D street, for the purpose of sinking deeper. As soon as any of the above companies reach the depth of 1,000 feet, we do not doubt but that the Comstock lode will be found extravagantly rich, and will thereby establish beyond a doubt the future prosperity of Nevada.

Reese River—

From the *Reveille*, Oct. 27th: The new re-verberatory furnaces for the Keystone Mill are completed, and will receive their first fire and ore this evening. They are a valuable addition to that fine mill, and will greatly increase its capacity, as nearly all our ores require roasting. . . . Capt. Page, of the Keystone Mill, says that the uniform price of crushing, whether in large or small lots, is now \$45 per ton.

Same of 31st Oct.: We learn from Mr. D. P. Bell, who returned yesterday from the Cortez District, that the reduction works of the Mount Teabos Company are a complete success. In the amalgamating department the Varney pans are used, with the addition of copper wings—the invention of Mr. Dunaing—and with the happiest results. The mines of the company are being worked with energy.

Colonel D. E. Buel arrived in town from Belmont yesterday afternoon with nine bars of bullion, valued at about \$9,000. The bullion was the product of Col. Buel's mill in the Philadelphia District.

Same of Nov. 2d: We learn from Judge David Cooper, who returned this afternoon from Silver Bend and Ophir Cañon, that the High Bridge mine continues to improve under work, and presents a splendid appearance.

From the Nye County *News* of Oct. 27th: We learn that the Belmont Water Tunnel

Company, in the Philadelphia District, have struck a fine stream of water in their tunnel. This will become a valuable property, as water is yet rather a limited article in that camp. The water is pure, and from the direction of its flow any number of mills can be furnished sufficient power to be kept constantly employed.

Rumboldt—

From the *Register*, Oct. 27th: This week, A. W. Nason, Superintendent, has closed up negotiations which secure to the Trinity and Sacramento Company the entire Montezuma claim. The purchases covered 820 feet, at \$50 the foot, eoin. Almost the entire amount has been paid. The fires will not again be allowed to die till at least the ore already out of the mine—400 tons—has been smelted. From the face of drifts and shafts now into the ledge, the ore can be taken out fast enough, with the start now on hand, to keep the furnaces employed through the winter. The mine is well opened for the comparatively slight depth attained, and the ledge shows most promisingly. The Etna mill belonging to this company has been removed down to Oreane, and will furnish, together with the Trinity mill, all the crushing force necessary for preparing ore for the furnaces. The building for the furnaces is 60 by 75 feet, and will accommodate five furnaces—three for smelting, one for calcining, one for refining. When the full force of furnaces is under blast, they will turn out, it is calculated, 30 tons of metal every 24 hours.

IDAHO.

From the Owyhee *Avalanche* of October 27th: The Poorman mine has been closed up for the winter. This was done in accordance with the terms of the settlement between the Hays & Ray and Poorman companies, as it was then agreed that work should be continued until November 1st, for the purpose of proving the value of the mine—and the latter has been done to the entire satisfaction of all hands, including the public generally. From the best information we can obtain, it is the intention of the N. Y. & O. Co. and P. F. Bradford—the owners—to have the mine placed in the possession of one company—by sale of all or purchase of part. During the coming week the mills will have finished working the balance of the ore now taken from the mine.

Twenty tons of Rising Star ore have recently been worked in the Lincoln mill with very poor results. It was not roasted, and that is given as the main reason why it did not yield larger. By assay this ore yields from a few dollars to several hundred per ton. W. H. Wickersham informs us that he has made different tests by pulverizing several pounds of the rock, putting it in a crucible and roasting it three or four hours in a blacksmith's forge, and thus secured results of over \$500 per ton. He is of opinion that thorough roasting will be necessary to work it successfully.

THE SILVER CORN.—This mine is yielding very rich ore as usual. We were shown very rich ore, in large chunks, by Mr. Musgrave, of the Cosmos mill, that came from this mine recently. Free flake gold abounds in the white solid quartz. Some difficulty is experienced in working the ore in consequence of the presence of antimony, sulphur and iron.

From the *Statesman* of October 23d: The Wind River expedition is a failure. All the different parties have broken up and dispersed in different directions—some to Salt Lake, others to the Missouri River, Montana, and some are coming back to Idaho. The failure to find mines, we are convinced, is not from lack of energy in the men who composed those parties, but because the mines are not there.

From the Idaho *World* of October 20th: During the week Col. Preston showed us a piece of exceedingly rich quartz, taken from the Leonora ledge, in the Yuba district, in Alturas county, at a depth of over forty feet. He left a day or two ago for the East, overland, and has taken several fine specimens with him. . . . The East Hill Tunnel company have struck rich indications at a depth of 350 feet in their tunnel.

MONTANA.

From the *Post* of October 20th: The mill of the National Mining and Exploring company in Oro Fino Gulch, Edgerton county, has a 15-horse power engine carrying ten stamps, of 630 pounds each, with 9-inch fall. Twelve hundred tons of ore are now on hand. . . . Messrs. Poethelwhite & Co. are erecting a 24-stamp mill at the point where Eagle Bird empties into Grizzly Gulch. The ledge averages eighteen inches of paying ore, and has yielded from thirty to fifty dollars per ton in the old Sultan mill.

For several weeks back reports have been rife of the discovery of new and rich diggings on the head waters of the Palouse, distant from Walla Walla about 150 miles. A party of prospectors—among them David Weston of Walla Walla—visited that locality early last spring, and although they obtained unmistakable indications of gold, owing to high water and other causes, they were unable to work to

advantage. A portion of the party returned to Walla Walla, whilst others remained and continued to prospect the country, and have at length succeeded in finding rich placer mines.

OREGON.

From the *Oregonian*: Late prospecting on the South Fork of the Santiam demonstrates the fact that there are numerous bars between Canal Creek and the settlements of the Willamette which will pay from two and a half to four dollars per day when properly worked with sluices. The best pay has invariably been found back next to the permanent banks. The parties making these prospects averaged about two dollars from prospect holes, with a rocker of rough construction.

COLORADO.

From the *Journal*, Oct. 16th: A friend just in from Argentine, informs us that everything is flourishing in that locality. Stowell & Co's furnace is running. Jon Watson started his furnace on Saturday last. The wagon road from Elizabethtown to the mines will be completed in about three weeks.

Editorial correspondence of same: At Fairplay this morning Mr. C. W. Lowe showed us ten ounces of beautiful gulch gold taken from the bar above town last week with two hands. Mr. Lowe says he has taken out from six to fifteen ounces a week all the season. The works are quite extensive. Four or five parties have long sluices. The bar is fifty to sixty feet deep, and old settlers have little doubt that it will pay to work for a thousand feet back on either bank. . . . The American Exploring company is preparing to put in a bed-rock flume at Fairplay next season, and purchase a tract there sufficient to justify them in going to considerable expense.

Above and below Hamilton, there have been nearly a hundred men gulching all the season, and they have done well. Extensive preparations for hydraulic mining have also been made. Here, opposite Fairplay, eight or ten companies are operating, which have made through the season half an ounce a day to the hand. Good prospects are obtained all over the northwestern portion of the Park, not too far from the numerous streams. Fairplay is on a stream formed by the confluence of the Montgomery, Buckskin, Musquito and Horseshoe branches, and is but eight or ten miles below those towns.

From the *Deaver News*: We were shown yesterday, by Mr. S. B. Kellogg, of this city, a specimen of specular iron ore, from a vein discovered near Laporte, on the Cache-la-Poudre. The ore assays sixty-five per cent. iron, and the vein is forty feet wide, every particle of material within the walls being apparently as rich as the specimen assayed.

From the *Denver Gazette*, October 19th: Whitney & Whiting have purchased eight hundred feet on the copper lode in Montezuma, from Duffield & Cooper, for the sum of ten thousand dollars. The same gentlemen have also made an agreement with O'Donald & Donnelly, to purchase four lodes in the neighborhood of Breckenridge for the sum of twenty thousand dollars. The most valuable of these lodes is the Bunker Hill, which has over four feet of galena at a depth of six or seven feet from the surface. The Cooper lode, in Montezuma district, has a crevice of ore from two to three feet wide on the surface, and has been traced for over one thousand feet up the mountain.

ARIZONA.

The new mill of the Vulture mine had arrived at Fort Yuma on October 20th. . . . One hundred and fifty ounces of gold from Walker's mill, near Prescott, was brought to this city by the steamer Orizaba, which arrived on the 6th inst.

AMATEUR MINING.—The Idaho correspondent of the New York *Tribune*, writing from Rocky Bar, Alturas county, deprecates the fact that although the quartz mines in that region are unquestionably rich, nearly all the companies who have attempted to work them are bankrupt. He attributes it to the fact that the managers know nothing of mining. As an instance of the absurd manner of doing things, he mentions the Defrees company, of Indiana. "This company built a mill at a place called 'Volcano' in this county, right in the heart of the best grazing and agricultural portion of the Snake River Valley. The mill is intended to go by steam—18-horse power, ten stamps, built by the Eagle Iron Works company at Chicago, is twelve miles from any considerable supply of wood, and fully thirty miles from any mine that will ever pay for working."

THE WILLAMETTE IRON WORKS, advertised in the Press, are spoken of in the highest terms of praise by our Oregon correspondent.

Metallurgy.

BOALT & STETEFELDT, Metallurgists and Mining Engineers

AUSTIN, NEVADA.
Western Branch of ADELBERG & RAYMOND, No. 90 Broadway, New York. 11v11

To Copper Miners and Others Interested in the Working of Copper Ores.

THE UNDERSIGNED HAVING BEEN APPOINTED Agent and Attorney by N. Haskell, for the sale of his COPPER SMELTING FURNACE, which has proved a perfect success, is prepared to furnish the same to parties having Copper Ore, or will make arrangements to buy their Ore, receivable at their mines. For further particulars, apply to JOHN N. RISKIN, 21v12 At Coffey & Riskin's, San Francisco.

MARTIN & CO.,
Office, Stevenson House,
Corner California and Montgomery streets (up stairs).

WILL CONTRACT FOR THE
PURCHASE OF COPPER ORES.
Assaying eight percent, and upwards of Copper to the ton. We will make advances upon Ores of Copper. San Francisco. Post Office Box 1259. 22

EUROPEAN METALLURGICAL WORKS,

—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test 1 Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and the so-called "rebellious ores" are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as well as a well equipped laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MURPHY.

JOHN TAYLOR & CO. IMPORTERS,

AND DEALERS IN
ASSAYERS' MATERIALS,
Druggists' & Chemists' Glassware,
Photographic Stock, Etc.
512 and 514 Washington Street,
SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & ORTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,

And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CANNES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast.

A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUPPLIES, ACIDS and CHEMICALS, constantly on hand.
San Francisco March 6, 1865. 11v10-11

Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years' steady and successful experience in working ores in Washoe and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address: F. M. SHAW, San Francisco, care Mining and Scientific Press. 13v13-14

GEORGE H. POWERS, M. D., Gives exclusive attention to Diseases of the Eye.

No. 626 California street, between Dupont and Kearny.
Dr Powers refers, by permission, to Rev. A. L. Stone, D.D., Ira P. Rankin, Esq., L. E. Benchley, Esq. 17v13-6m

For Sale—Cheap.

A GOOD PAYING BUSINESS, TOGETHER WITH THE good will of the party, controlling the entire trade of this city and State. It is suitable to any intelligent business man, and has averaged about \$600 per month. It is now offered low, solely because the proprietor is compelled to leave the city. Address "S. H.," Lock Box 602 Post Office, or inquire at S. W. HOWLAND'S, No. 24 California street, San Francisco. 17v13-1m

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the MINING AND SCIENTIFIC PRESS, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner. DEWEY & CO., Patent Solicitors. San Francisco, June, 1866.

Mining and Scientific Press.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the Mining and Scientific Press in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

San Francisco:

Saturday Morning, Nov. 10, 1866.

NOTICES TO CORRESPONDENTS.

OWING to the large amount of correspondence received relating to interesting points connected with Mining, Metallurgy, Mechanics, etc., we are compelled, for want of time and space, to reply briefly in the following form to a portion of such queries as are of general interest.

VENTILATION OF MINES AND TUNNELS.—C.

J. H., OF FOREST HILL., requests that attention may be called to this subject, which we admit, with him, to be of serious importance. C. J. H.'s communication appears to be written more with the object of requesting the opinion of others, rather than as expressive of his own. As, however, he has given a very concise resume of the methods commonly adopted, we submit the same in a more formal manner than they were conveyed in his letter to us. We do so with the object of directing the more pointed attention of those who may feel disposed to give some little consideration to the matter, and afterwards to communicate their views through the medium of this journal. C. J. H. assigns as a reason why he has addressed us, that in consequence of seeing the many valuable suggestions which were obtained from many quarters in consequence of our lately ventilating the matter of the employment of syphons in mines. C. J. H. describes the following modes as being adopted:

1. Two tunnels are run, one to work the mine through (if they find one), the other for ventilation, respecting which method C. J. H. observes, that the latter, when the charge for closing old connections and openings are included, not unfrequently costs more than the former or main tunnel.
2. When water can be obtained, what is termed the "water blast" is employed, which occasions a current of air, owing to a fall of water over the mouth of the tunnel, the fresh air being conveyed into the interior of the mine by means of tin or zinc pipes a few inches in diameter.
3. Having a furnace at the exterior connected with a series of similar pipes.
4. By a larger pipe or box of wood, elevated considerably above the mouth of the tunnel and continued into the mine, similar to the piping described in previous instances.

C. J. H. complains that all the above methods embrace outlays too great for poor prospectors, and would like to know if any simpler and less expensive methods are practicable. We invite suggestions on the subject, which, as we think the circumstances admit, will be inserted in full or digested in a resume.

AGRICOLA, GEORGETOWN.—There can be no doubt that the foothills of California present the finest field in the world for the profitable and secure investment of small capital, when associated with a hard-working family. Agriculture may present fewer great prizes, as compared with mining occupations, but on the other hand, it is a pursuit in which occur few failures when accompanied by industry and its almost invariable attendant—health. A well organized system of impoundage of our winter floods, to be distributed in the dry season for mining, manufacturing and agricultural uses, is much needed. Such a system, if perfected, would permanently add millions to our annual wealth.

J. K., HUMBOLDT.—We have not learned, up to the present time, that any species of the emerald, or its less valuable variety, the beryl, has hitherto been found on this part of the Pacific coast. It is not improbable that the mineral you allude to is some form of silica, colored green by a carbonate or other salt of copper. The finest emeralds are obtained from the Muso mine, near Santa Fe de Bogota, New Grenada. It was from this mine that the large and perfect hexagonal crystal was obtained which is owned by the Duke of Devonshire. It weighs 8 ozs. 18 dwts. The matrix was a very dark, highly carbonized limestone.

GOLDSMITH.—Touchstone, the name given to the stone employed in your business to test the fineness of gold, is a silicious stone of the jasper variety, having usually a very dark or black color. The latter character assists much a purchaser or operator in estimating the amount of gold present in a specimen, especially when the streak drawn across the stone has been acted on by nitric acid.

B. Y., MOXO.—The substance you allude to is probably chert, or as it is sometimes called, hornstone. If so, it will simply consist of an impure flint, which it greatly resembles, hornstone commonly being more splintery in fracture, and also more brittle than flint.

RAILROAD TRACK-LAYING MACHINE.

Mr. W. D. Robertson, the inventor of the Railroad Track-Laying Machine, which we noticed in our issue of September 1st, has constructed a model of the same, which he is now exhibiting to the mechanics and capitalists of this city in the room over the Blue Wing saloon on Montgomery, near the corner of Clay street. The model on exhibition is of working size, being about six feet long and one foot in width. It is placed upon a small track, in front of which is a section of road graded for receiving its track. When the machinery is set in motion, it goes forward, dropping the ties, one after another, in place, until a sufficient number are laid for receiving a length of rail. The machine then stops for a moment while two rails are dropped into place from opposite sides of the machine, much as a boat is lowered from the cranes of a ship. The moment the rails are laid they are adjusted by attendants upon the ground, while the machine moves forward, dropping into their places the ties for another section. By the time these are in place and another set of rails swung over the side of the machine, the attendants are prepared to receive and adjust them also. Thus the machine may move on, hour after hour, at the rate of two and a half miles every twelve hours. A scraper precedes the machine, to make smooth any trifling inequalities that may exist on the grade.

The arrangement for dropping the ties consists of a large wheel, built very much like the wheel of a stern-wheel steamer, without floats, only in this case the wheel is forward. It turns toward the machine. At the extremity of each set of arms are notches, into which, as they come slowly round, is dropped, by hand, a sleeper, that is carried down to the graded surface of the road, which the wheel overhangs, and at the proper interval, regulated accurately by machinery, the sleeper is dropped on its flattened side, while at the same instant four huge stumps (two only exhibited in the model) come down upon its surface with sufficient weight to bed it firmly in the earth and hold it in position, while two cutters, with knives like those of a planing machine, pass across its upper surface, cutting to its proper depth the seat or gain for the rail or chair. By the time this is done the next sleeper is on the ground, when the weights or stamps are immediately raised and dropped upon it, and so on. The sleepers are piled up in front of the wheel, and two attendants taking them up by either end, readily drop them, one after the other, into their places on the wheel. There are four or five sleepers upon the wheel all the time. As the car is propelled and the wheel turned by the same power and connected by gearing, everything operates like clock-work, and every timber must fall into its proper place and at the proper interval of time.

The machine is easily adjustable, may be made to drop its sleepers at any desirable distance apart, and will work upon curves. A supply train to any extent may follow the machine, across which, through its entire length, is laid two small side tracks, for hand cars, upon which the ties are carried from the rear of the train to the forward part of the machine. The rails, as they are wanted, are dragged forward from their place of deposit to the front of the machine over rollers, much as a log is dragged from a pond up the logway into the mill, by a donkey engine or by hand. The whole apparatus is extremely simple, compact and inexpensive. A machine for practical working can be constructed in this city for from \$3,000 to \$4,000. It is calculated that twenty-five men, by the aid of this machine, will be able to lay two and a half miles of track in twelve hours; while by the old method it will require over one hundred men to lay half a mile in the same time. The great saving of time and labor is chiefly effected in carrying the material forward upon the machine as the work progresses, doing the work with few men, no one of which is ever in the way of another, etc.

The whole machinery is arranged on true mechanical principles, and experienced machin-

ists and railroad men, who have witnessed the working of this model, express the opinion that it cannot fail to do its work, and do it accurately and effectually. The inventor is now exhibiting the same with the view of calling the attention of capitalists to its practicability, to the end that some one may be found who will furnish the means of first giving it a practical trial in this State. It is an invention which belongs to the Pacific coast, and one which we think is destined to play a prominent part in future railroad construction; and it is to be hoped, for the credit of our own mechanics, that it may be first put into practical use here.

THE EXPECTED METEORIC DISPLAY.

The savans predict an unusually brilliant exhibition of meteors at some time between the tenth and fifteenth of the present month. Meteoric showers have been witnessed in August of each year since 1837, with considerable regularity. But it is believed that the one now looked for will be of the same character with that which occurred on the nights of the 12th and 13th of November, 1799, and on the corresponding nights of 1833, suggesting the probability that a period of one-third of a century elapses between the times of coincidence of the earth's orbit with their track.

Remarkable single meteors have appeared, at times which, with our present lack of data, seem to be irregular; although it is probable that many of these, too, like comets, have their regular periods of revolution. The origin of meteoric showers is not definitely explained by scientific men. Prof. Olmstead, of Yale College, thinks that they are portions of a nebulous mass revolving around the sun, in an orbit whose aphelion meets the orbit of the earth once a year, at the time when the annual display to which we have referred, occurs. It is probable that meteors are not self-luminous, but that they become incandescent upon plunging into the earth's atmosphere, owing to the exceeding condensation produced by their tremendous velocity, thereby causing ignition of their own substance. The remarkable meteor of July 20th, 1860, was seen by a Boston gentleman through a powerful telescope. He chanced at the moment to be looking at the planet Mars, and seeing the light of the meteor, he turned his telescope upon it and followed its course. He noticed that the sparks forming the train came from the front of the mass, where the compression of the air being greatest, the combustion was most intense. The display of 1833, to which we have alluded, was the most extraordinary on record. It is said that at least a quarter of a million of these meteors were visible at that time.

WISDOM IN INSURING.—One of the most satisfactory investments made, is that of insuring a life in sound, reliable companies, such as are conducted upon liberal and rational principles. Foremost among these companies, stands the "Old Connecticut Mutual Life," which we recommend to the consideration of every prudent individual who has a desire to procure a policy. In making bank deposits men are careful to place their hard-earned treasure in good hands. They should be equally cautious to whom they entrust their premiums for insurance. It is our opinion that there is no safer company than that advertised in this paper, and represented on this coast by Messrs. A. D. Smith & Co.

CALIFORNIA BRASS FOUNDRY.—This establishment, whose advertisement appears this week, was established in 1850. Having been recently enlarged, and affording superior facilities for turning out creditable work, the present proprietors, by a strict attention to business, hope to obtain their full share of the public patronage.

PATENT FOR SALE.—The Rock Drilling Machine of Mr. R. A. Thomas appears to be an article much needed in many of our mines. The patent right is advertised for sale. Mr. Thomas is a practical miner, and has used this drill in his mines at Damascus, Placer county, for the past two years.

ADVERTISING AGENCY.—Messrs. I. N. Hudson and L. P. McCarty have formed a copartnership for the purpose of carrying on an advertising and general collecting business. They are both experienced and energetic business men, and all matters entrusted to them will be expeditiously attended to. In their circular they agree to be responsible for, and pay all advertising bills entrusted to them, at the expiration of ten days after the term for which they are inserted—the carrying out of which proposition will be appreciated by interior publishers and journalists. Their office is located at No. 315 Montgomery street.

SODIUM AMALGAM.—We would call attention to the advertisement in another column, headed "Important to Workers of Gold and Silver Ores." Mr. Slosson, the California agent of the Wurtz Amalgamation Company, is prepared to supply the licenses for the use of the sodium amalgam, and also the amalgam itself, as prepared by the inventor. Persons at a distance who may be desirous to obtain more particular information upon the use of this new amalgamating agent, will do well to apply to the agent for the Business Circular just published by the Company.

THE PACIFIC MAP DEPOT.—A. Gensoul, at the Pacific Map Depot, 511 Montgomery street, keeps constantly on hand a large assortment of maps, atlases, guide-books, etc., of every description. Either the traveler or the student may there find almost everything in this line which he can need or desire. All the most recent county, state and local maps which have been issued on this coast, may be found at Gensoul's, a large portion of which have been published by Mr. Gensoul himself.

THE HORSEFALL GUN, made in 1856, is to be fixed at Tilbury Fort, to protect the entrance of the River Thames. This gun is fifteen feet ten inches in length, and the diameter of the bore is thirteen inches. The weight is 53,846 pounds. It is a solid forging of wrought iron, bored out. The forging was done under a 15-ton hammer. The charge of powder is about fifteen pounds. The solid shot used weight 282 pounds each.

ANCIENT RIVER CHANNELS.—Our correspondent, "Viajador," commenced a series of articles in our last issue, concerning the gravel deposits of Sierra county, which should be read by all placer miners. Even if they do not agree with "V.," we are sure they will gain much by examining his views on the subject. His communication this week is a continuation of his description of the mines of that county.

LOOKING GLASS AND PICTURE FRAMES.—Having examined some very fine examples of work at the new store of Mr. Kollmyer, who has recently opened on Third street, we take pleasure in calling attention to his advertisement, believing that he is prepared to turn out as fine specimens of workmanship as can be found anywhere in his line.

THE DAILY TIMES made its appearance on Monday, the 5th—the day promised by its proprietors. It has the best typographical appearance of any daily in San Francisco, and exhibits a spirit of energy and liberality which we are constrained to say has not lately characterized the daily press of this city, according to our experience.

CASTINGS.—Messrs. Palmer, Knox & Co., of the Golden State Iron Works, in this city, melted over 290,000 lbs. of metal during the month of October. They manufacture a superior article of white iron shoes and dies, for stamp batteries and amalgamating pans and grinders.

O. M. CLAYES, State Printer, and John McComb, have recently become associated with Fred. MacCrellish and W. A. Woodward, in the publication of the daily *Alta California* newspaper.

PLUMBERS AND GAS FITTERS.—If you want work in this line, warranted to prove satisfactory, see advertisement of McNally & Hawkins, which appears this week.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, new and important inventions; also, the list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which, in view of local interest to readers on this side of the Continent, most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent Issued.

PATENTS RECENTLY ISSUED.

STEAM VALVE.—David Sexton, San Gabriel, Cal.: This invention consists of a thimble-shaped valve, provided with a transverse partition and fitted on a central spindle, which is held in position by a suitable taper screw, in combination with a cylindrical valve chamber, and with suitable steam and exhaust ports situated on opposite sides of the transverse partition in such a manner that by said partition the pressure is separated from the exhaust end of the valve and thrown entirely on a center or pivot, and a valve is obtained which works free and easy, and the position of which can be regulated from the outside.

CARD CASE.—F. A. Lamontagne, Montreal, Canada: This invention consists in the construction of card cases with a combination of springs and slides for the discharge of a card at a time without opening the lid, by simply pressing a slide on the top with the finger. It is designed for the use of ladies especially.

CIPHERING MACHINE.—Samuel J. Kelso, Detroit, Mich.: This invention relates to a machine which can be used for adding, subtracting and multiplying figures of any desired magnitude, with the greatest ease and facility.

CAR WHEEL.—E. S. Robinson, New York City: It consists in having the body or main portion of the wheel of cast iron and composed of two plates of disk form, the convex surfaces being at the outer side, said plates being connected at their peripheries by cross pieces, the two plates and cross pieces being all cast in one piece. The tire or tread of the wheel is of wrought iron or steel, and is secured upon the body or main portion by means of rivets.

DISTILLING OIL.—Samuel Andrews, Cleveland, Ohio: 1st, I claim the fire chamber, C, and reverberatory chamber, F, in combination with the throat, C, and the openings, I, in the manner and for the purpose substantially as set forth. 2d, I claim the reverberatory chamber, F, in combination with the throat, A, as and for the purpose specified. 3d, I claim the flues, J, when separated from the walls of the throat by the wall, J', as and for the purpose set forth.

PISTON-ROD PACKING.—Charles P. Beaoit, Detroit, Mich.: 1st, I claim the corrugated or grooved packing rings, D, D, in combination with the elastic coil of packing or stuffing, E, the cup-lipped flange, G, the annular space around the piston rod, C, or the lubricating chamber, H, with its connected oil cup, I, and the screw bolts, K, K, with the springs, b, b, under the nuts, c, c, all constructed, arranged, and related to each other substantially in the manner and for the purposes herein described. 2d, I claim the lubricating chamber, H, combined with the piston rod, C, the flange, G, and the packing rings, D, D, substantially as and for the purposes herein described. 3d, I claim the cup-lipped flange, G, combined with the elastic coil packing, E, and the corrugated rings, D, D, constructed and operated substantially as and for the purposes herein described.

MACHINE FOR ASSORTING POTATOES, COAL, ETC.—Mahlon D. Dickinson, Pitts' Grove, N. J.: I claim the crank shafts, A, A, sieves, B, B, and suspension rods, E, E, when combined and arranged, as and for the purpose set forth.

INDIA-RUBBER NECKTIE.—William H. Hulsey (assignor to David N. Ropes), Hoboken, New Jersey: I claim the arrangement of the band of metal, or its equivalent, in a necktie, formed of hard india rubber, or similar material, under the external strip or band, passing around the bow and necktie, for confining together and holding the several parts of the necktie, and preserving the external band from fracture, substantially as above described.

FORGE FURNACE.—Bennet Hotchkiss, New Haven, Conn., and Henry Shattuck, Hamden, Conn., assignors to Bennet Hotchkiss: We claim—1st. Combining a forge, A, with a reverberatory furnace, C, in the manner substantially as described for the purpose specified. 2d. Applying a current of air, whether set in motion by an artificial blast or by the chimney draught, to cool the furnace doors and to furnish a draught to the fire, in the manner substantially as described. 3d. The use of an air blast to prevent the flames and gases from the belching from the furnace when the door is opened, arranged and applied substantially as described. 4th. The combination of a cistern, K', arranged as described, with the furnace, A, for the purpose of converting into vapor a body of water by the waste heat of the furnace, and applying such vapor to stimulate combustion, substantially as set forth. 5th. Combining with the escape flue, J', a space, L,

for the circulation of air, and connecting the same with the furnace for aiding the draft of the fire, substantially as described.

IRON RAILROAD CARS.—S. Merrick, New Brighton, Pa.: This invention relates to the manner of connecting together and securing the panels to the car, whereby the constructing of iron cars is greatly facilitated and the panels rendered capable of being readily removed for repairs when necessary, and peculiar advantages afforded for the finishing of the interior of the car.

FURNACE AND BOILER.—Henry McClure and James Ellis, Tero Haute, Ind.: This invention is designed to furnish an improved furnace and boilers so constructed and arranged that the heat shall strike the boilers, except the first one, above any deposit of sediment that may be in them; that the draft may be adjusted to all changes of weather; and that it may be a complete smoke consumer.

METHOD OF SCOURING WOOL.—Gustave Michelet, Brussels, Belgium: I claim the combined process for extracting from the wool itself all the elements necessary for cleaning, scouring or removing the soil from the same, and of obtaining by the same operation liquids free from foreign matters which would decrease the value of the products derived from them, and sufficiently concentrated for forming these sub-products with advantage, substantially as above described.

STAMP MOISTENER.—H. A. Hoyt, Mott Haven, N. Y.: This invention has for its object to furnish an improved apparatus for moistening stamps preparatory to attaching them to their places.

CENTER PIERCE.—Samuel Kellett, San Francisco, Cal.: Two patents. Designs.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In one half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE. DEWEY & CO., Patent Agents, 505 Clay street, San Francisco.

ARTISTIC.—Any one wishing to see excellent specimens of engraving, will find themselves amply repaid by calling at the office of Mr. W. E. Goldsmith, whose address will be found in our advertising columns. Mr. G. has for a long time taken the lead in his profession in this city.

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10

BOOK AND JOB PRINTERS,

PUBLISHERS OF THE

MINING AND SCIENTIFIC PRESS,

505 Clay street, San Francisco.

To Miners and Families Living in the Country.

DR. BOYNTON'S MEDICINE CHEST, is put up in San Francisco expressly for the use of families, and consists of a chest of moderate dimensions, neat in its appearance, containing those household articles, simple remedies, that families always feel like keeping on hand for immediate and common use, and a book of brief instructions, describing their use.

The object in preparing this Chest was not to make doctors; but for the simple purpose of nursing; hence, a majority of the remedies are such as are familiar to nearly all who are advanced in life, and the book is simply a representation of those plain truths relating to the department of the nurse already set forth in more extensive works. It was the object, not to say many things, but to say few things—to simplify and make plain for common use. And in selecting the contents of the Chest, the object was not to set forth something new and wonderful, but those of old and acknowledged worth.

In view of the above facts, physicians have everywhere encouraged the circulation of this chest in unmistakable terms. They recognize the fact that families do not, will not, need not call on them on the occasion of every slight derangement or infirmity. They do not and cannot deny the fact that such obligations of home care rest upon heads of families.

The book gives a description of nearly every medicine in the collection, their use, and their component parts, so that every person may know what he is receiving into his stomach or applying to his person. This openness and frankness is regarded by the best practitioners, and all considerate persons as justice, more than policy. The universal conviction of the more thoughtful is, that that which relates to our health and physical well being in this life should, above all things, be known, and not kept in the darkness of secrecy.

In introducing this chest in the country, we always first submit it to the criticism of practicing physicians, and feeling the importance and seeing the necessity in this sparsely settled country of home-nursing, and seeing the adaptability of this chest, physicians in San Francisco, Sacramento, Stockton, Knight's Landing, Cacheville, Marysville, Colusa, Oroville, Lincoln, Folsom, and Auburn, have given it their hearty sanction. Seeing the necessity on this coast of people relying upon themselves in such matters, physicians in this State have remarked: "If I could choose but one for a family, I would every time choose the nurse instead of the physician." "If families would get a collection of simple remedies, with plain instructions for their use, they would do away with half the doctoring." "All families should possess themselves of a collection of common remedies, with plain instructions for their use." "I would like to see the chest in every family." "It is a convenience." "It is useful." "Much sickness and much expense might be saved by such home care."

We submit the following statistics from Sutter County, California:

"The undersigned have had Dr. Boynton's Medicine Chest in their families for the last few months, and willingly state that they regard it as a wise provision, strictly practical and highly useful."

Every person having the chest in the above named county has signed the above article. The publishing of the names being unnecessary, we withhold them and save space.

The undersigned have known Dr. Boynton's Medicine Chest for the last few months, and regard it as a wise provision, and highly useful in every family. The medicines being put up with instructions, its utility, convenience, and great economy are unquestionable.

Signed by Judge HERBERT and 45 others.

STATE OF CALIFORNIA, County of Sutter, ss. I, C. E. WILCOX, County Clerk in and for said County, hereby certify that I am personally acquainted with a majority of the individuals whose names are subscribed to the foregoing certificates, and that they are good and substantial citizens of said county.

Witness my hand and official seal this 27th day of [L.S.] December, A. D. 1865.

C. E. WILCOX, County Clerk.

Agents wanted in every County to sell this Family Chest. The compensation will be a liberal commission on all sales.

The Agent should be a resident of the district which he is to canvass, and accompany his application with good references, and of this city if possible.

We can give further particulars when desired.

All letters should be addressed through the post office, to E. NORRIS, San Francisco.

IMPORTANT WORKERS OF GOLD & SILVER ORES.

THOSE INTERESTED WILL FIND IT TO THEIR ADVANTAGE to call on MR. WILLIAM SLOSSON, at Prof. W. P. Blake's Office, and obtain a Business Circular, just published by the WERTZ ALUMINATION COMPANY of New York, who have secured the Patents of Prof. Henry Wurtz, the sole and exclusive right to the use of sodium in amalgamation. Mr. Slosson is prepared to supply the licenses of the Company, with the material for applying this new and wonderful discovery, by which, in the words of President Bernard of Columbia College, "two grains of gold may be gathered where but one was before." 19v13-2m

ELECTROTYPING CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

Brevities.

ONE million and a half of cigars are made to San Francisco monthly.

The seedless Zante grapes have attained perfection in Santa Clara county.

B. D. WILSON, of Los Angeles, has some four hundred lemon trees on his plantation, nearly one-half of which are of the Malaga variety.

NICHOLAS WOOD, an eminent coal miner, a man well known to the English public, and the especial and intimate friend of George Stephenson, is dead.

TWENTY-FIVE tons of peanuts, raised by Chinamen in Yolo county, were shipped for this market in one day. They are said to be larger and finer than those imported.

A locomotive lately run the distance from Berlin, Connecticut, to Hartford, in fourteen minutes, or nearly a mile a minute, under steam produced by peat fuel.

The Turks pound their coffee in a mortar, instead of grinding it as we do. The pestles, after long use, become precious, and bring great prices. Savarin says that coffee thus treated is far superior to that which is ground.

The town of Healdsburg has been somewhat excited over reported rich "strikes" of gold-bearing quartz on Russian river, near Geyserville. Rumor says several gold ledges have been found, and rock taken out which showed the yellow particles of gold to the naked eye.

BALDWIN's Locomotive Works, in Philadelphia, has turned out an engine, named "Consolidation No. 63," which weighs 38 tons 6 cwt. It has eight driving wheels, forty-eight inches in diameter, with but a single truck; length of furnace one foot, 173-inch flues, 20-inch cylinder, with 24-inch stroke. The weight of the engine rests upon the drivers. In a trial made a few days since this engine drew seventy-five empty coal cars up a 146-foot grade.

PROFESSOR EAMES, assistant State Geologist of Minnesota, has examined the Vermilion Lake mines. He reports the veins as true fissure veins, and says they yield gold and silver in quantities which will abundantly pay for working. They are easily traced for a distance of a mile and a half. The auriferous district, however, is limited in extent, and its geological limits were distinctly traced in the surrounding rocks, which enclose a gold-bearing district of about fourteen miles long and eight in width.

WEEDS.—The microscope reveals the fact that every stem and twig as large as a quill contains some ten thousand little tubes, through which the water, or sap is constantly passing upward during growth, to the leaves above, which spread it out by means of their fine net-work, and give it in the form of vapor to the air. With ten weeds upon a square foot, it is estimated that the careless farmer has forty-four million pumps at work on every acre, dissipating the moisture and drying up the soil at the expense of the crops.

Machinists and Foundries.

Our Patent Agency.

The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been organized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and Foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trust, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

A neat and useful journal One of the most presentable and useful in the State. —[Sunday Mercury.]

Established in 1849—Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coaling Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.
ENGINES. Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.
BOILERS. Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.
PUMPS. The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY. Wheeler & Randall's improved Tractory Curva Pan, Zenos Wheeler's improved flat bottom pan, Beldin's pan, Vetch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Cearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wool or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Gams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.
OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.
Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

Gold Discoveries in New Brunswick.

The following is a portion of a private letter from an old subscriber of the MINING AND SCIENTIFIC PRESS, to a friend in this city:

I have been exploring through this Province all summer for minerals. I have found gold in four counties, being the only four that I explored, and I am in hopes that I may make something out of my summer's work. I found gold first on the Serpentine river, a tributary of the Tobique, for a distance of twenty-seven miles along the river. The summer has been very wet, and at the time I was there I could not get to the bed rock, but found prospects on the surface of the bars which looked very promising—just as good as one would get in similar places in California. I then went to the Miramichi river. I found gold along the river for a distance of eighty miles, and in some places the prospects were good. I then tried the Shikihank river, that runs into the St. John, about thirty miles above Woodstock; also Grand Falls, seventy miles above Woodstock; Grier's Creek, fourteen miles below Woodstock; Bulls Creek, a short distance below Woodstock, and several other places throughout the counties named, and found encouraging prospects. The places that I have named you are quite familiarly acquainted with; and the area of the gold field that I have discovered up to the present time is about 480 square miles. I can scarcely believe myself when I come to think that there should be such an immense gold field in this Province.

I have secured a lease for fourteen square miles on the Serpentine. The lines of the lease do not follow the sinuous course of the river. This makes me owner of twenty-three miles along the river. The whole course of the river is penetrated by quartz veins from a few inches to several feet in width; and the river bars and crevices of the slates contain gold from one end to the other. The terms on which I obtain the lease are as follows: I have the right to raise and carry all the minerals or metals—let it be coal, gold, silver, lead, tin, antimony, plaster of paris, salt, or any other mineral or metallic substance; also the right to manufacture or use the same for the term of twenty-five years, and at the expiration of twenty-five years the Government can take the mines by paying for all the improvements, the value of which is left to arbitrators; or they can continue to lease for the same term (twenty-five years), by my paying twenty dollars per square mile, that is, \$280 for the fourteen square miles, for the said term of twenty-five years. * * *

The Serpentine contains gold and silver, with very good indications of copper. The Wapaskagan contains gold and silver, plaster of paris, and mineral paint. The Shikihank contains iron, gold and lead, with indications of silver. The Beccaguimec contains gold and iron.

B. M. HARTSHORNE,
President.

The Mining Press has entered upon its thirteenth volume. It is a valuable publication in its sphere, and its sphere is a large and important one. [Marysville Appeal.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

Single Rooms, 50 cents.
Railroad Ticket Office and Stage Office on first floor. 7v12-3m A. J. SENATZ, Proprietor.

Rheumatism!!

ANOTHER WITNESS!

SALMON FALLS, June 17, 1865.
H. BOWMAN—DEAR SIR: HAVING HAD A FAIR test of the virtues of RICHARDS' REMEDY FOR RHEUMATISM, I take great pleasure in stating that its effects with me have been even better than its recommendations claim. In 1853 I first heard of the medicine. I had then been for three years severely afflicted with Rheumatism, and having tried everything I could hear of, without any permanent benefit, I concluded to try this also. On taking the medicine, in three days I experienced great relief, and in one week was entirely free from pain, and had completely recovered the use of my limbs, which had become powerless, so much so that I could not dress myself without assistance. Since that time I have been free from Rheumatism. I have recommended RICHARDS' REMEDY to numerous friends, and in every case it has proved successful. I therefore take great pleasure in recommending it to all who are afflicted with Rheumatism, and especially to all mercurial chronic Rheumatism cases. Yours respectfully, (Signed) ERASTUS PARSONS, President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by H. BOWMAN, Druggist, Sacramento, 11v13 Price, \$2.50 per Bottle.

Important to Californians.—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unequalled line of agents who have not complied with the Government laws and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press, Patent Agency has strictly complied with the requirements of the Department, and properly filed all necessary papers as Claim Agents.

Pacific Law and Collection Office

W. H. ALLEN,

Attorney and Counsellor at Law,
Principal Office at Rooms 11, 12 and 13 Amory Hall Building,
502 Montgomery Street, San Francisco, Cal.

Agencies at every City and Town on the Pacific Coast. Collections guaranteed with or without suit in all the cities and counties of the Pacific and Atlantic Coasts.

Legal advice will be given free of charge until after 1st January, 1867. Postage on letters asking advice must be paid both ways. 8v13-3m

REMINGTON'S ARMORY.

Agency, 310 Washington st., San Francisco.

Has his studies and manufactories in the same building. Every kind of Apparatus, Trusses, orthopedic Instruments, Artificial Limbs, etc., are manufactured and applied by himself.

He has no connection with any Agency. 8v13-4y11p

BROWN & BEADLE,

Offer their services to
INVENTORS AND THEIR ASSIGNEES,

PATENT SOLICITORS.

They will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to them for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,
—OR FOR—
EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as Attorneys in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D. C. 7v12-3m

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

CONNECTICUT

Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS.....\$12,000,000.

THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,
The Largest Amount Insured,
The Largest Surplus,
The Largest Business,
The Largest Income,

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT. of the premiums paid during the year ending 31st of January, 1863.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies to which Life Insurance is applicable, among which forms are—

Whole Life Policies, by a continued annual life premium.

Whole Life Policies, by TEN annual premiums.

Endowment Policies, by a continued annual premium.

Endowment Policies, by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give a note in part payment of the premium, but may, if preferred, pay the first four premiums in cash after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums one-half. When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be applied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

DIRECTORS:

JAMES GOODWIN, HENRY C. ROBINSON,
GEOBGE S. GILMAN, GUY R. PHELPS,
MARCUS F. HOLMES, R. D. HIFANY,
New York, CHARLES F. THAYER, Boston.

Accidental Insurance!

The Accidental Insurance Company
OF NEW YORK.

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident. In case death does not result from the injury, the insured receives a weekly compensation as long as he is disabled (not to exceed twenty-six weeks).

ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in terms of the Annual rate, as follows:

1 month, 2-10.	4 months, 6-10.
2 " 3-10.	5 " 8-10.
3 " 4-10.	6 " 7-10.

GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices throughout the country.

They make Insurance for \$5,000, and \$25 per week compensation, against Accidents of every description, Travelling or otherwise; good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident" to the Public convenience in which the assured may at the time be travelling, but they are GENERAL ACCIDENT TICKETS.

SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and other Ports. Rates varying with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with W. BARKES, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

INDUCEMENTS.

The rates of Premium are very low.

The Plan is so simple that any one can comprehend all its workings.

No MEDICAL EXAMINATION is required, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory insurance can be made of so small a sum.

For Policies or further information, apply to

Illegal Supplemental Advertising.—It
 would be well for Mining Companies, whose advertise-
 ments are repeatedly appearing in the Supplements of
 daily papers, to inquire into the legality of that class of
 advertising.

THE MINING AND SCIENTIFIC PRESS, published by Dewey
 & Co., San Francisco, should be in the hands of every
 miner. It gives every week information that is indispen-
 sable to the proper prosecution of mining. Every miner
 can avail himself of the latest improvements by subscrib-
 ing for it.—[Havilah Courier, Oct. 13.]

OLNEY & CO., Auctioneers,
 418 Montgomery street, San Francisco.

Administrators' Sale of Real Estate.

NOTICE IS HEREBY GIVEN, THAT IN PURSUANCE
 of an order of the Probate Court of the City and
 County of San Francisco, in the State of California, made
 on the fifth day of November, A. D. 1886, in the matter of
 the estate of ELIZA ANN DOUGLAS, deceased, the under-
 signed, the Administrator of said estate, will sell at public
 auction, to the highest bidder, for cash, in one parcel, and
 subject to confirmation by said Probate Court, on MON-
 DAY, the third day of December, A. D. 1886, at 12 o'clock
 P. M., at the auction rooms of Olney & Co., No. 418 Montgomery
 street, in the City and County of San Francisco, all the
 right, title, interest and estate, of the said intestate at the
 time of her death, and all the right, title and interest that
 the said estate has, by operation of law or otherwise, acquired
 after her death, in and to that of the said intestate at the
 time of her death, in and to all that certain lot, piece, or
 parcel of land, situate, lying, and being in the said City and
 County of San Francisco, State of California, and bounded
 and described as follows, to wit:
 Commencing at a point in the southerly line of Broad-
 way street, distant one hundred and fourteen feet six
 inches easterly from the southeasterly corner of Broadway
 and Powell streets, thence southerly along said line of
 Broadway street and parallel with Powell street seventy-
 seven feet six inches; thence at right angles westerly nine-
 teen feet six inches; thence at right angles southerly and
 parallel with Powell street nineteen feet four inches; thence
 at right angles easterly three feet six inches; thence at
 right angles southerly and parallel with Powell street forty
 feet eight inches; thence at right angles easterly thirty-
 nine feet six inches; thence at right angles northerly
 and parallel with Powell street one hundred and thirty-
 seven feet six inches to the southerly line of Broad-
 way street; thence westerly along said line of Broad-
 way street twenty-three feet six inches to the point of
 beginning.
 Terms and conditions of sale: Cash—ten percent of the
 purchase money to be paid to the auctioneer on the day of
 sale; balance on confirmation of sale by said Probate
 Court; deed at expense of purchaser.
 SAMUEL S. MURFEY,
 Administrator of the Estate of Eliza Ann Douglas, deceased.
 San Francisco, November 10th, 1886. 19v13

 hail from all parts of the coast. It is published at San
 Francisco, at \$5 per annum, or \$5 for six months. Address
 Dewey & Co., publishers of MINING PRESS, San Francisco
 [Nye County News.]

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new
 laws relating to mining and corporations in Cali-
 fornia and Nevada, passed in 1865-6. Some of
 these laws are of the highest importance to parties
 interested in the matter of locating and holding
 claims, and prospecting mines, in these States.
 Copies sent by mail. Price, 25 cents.
 Address, DEWEY & CO., Patent Agents,
 San Francisco, May 1st, 1866.

New Mining Advertisements.

Ethan Allen Gold and Silver Mining Company.
 Location of Works, Austin, Lander County, Nevada.

Notice.—There are delinquent, upon the following de-
 scribed stock, on account of assessment levied on the fourth
 day of October, 1886, the several amounts set opposite the
 names of the respective shareholders, as follows:

Names.	No. Shares.	Amount.
I. N. Green	399	\$399 00
M. L. McDonald	85	25 00
J. M. McDonald	81	42 00
William McKenzie	67	43 50
J. M. Reynolds	168	84 00
Nathan Porter	120	60 00
Thomas B. Bishop	100	50 00
John Gray	103 1/2	84 50
A. C. Nichols	51	25 50
W. R. Satterlee	10	5 00
George F. Bliss	5	2 50
Joseph E. Eckley	8	4 00
Joseph White	20	10 00
Elkan Cohn	5	2 50
J. Preston Moore	28	14 00
John Taylor	12	6 00
R. O. Sturdivant	10	5 00
James Cameron	10	5 00
G. Forrest Walter	3	1 50
Henry Zeisler	1	50
Edmund Gould	1	50

[The certificates originally issued for the above stock, and
 for the whole capital stock of the Company, were, prior to
 the levying of said assessment, surrendered to the Com-
 pany, and the whole of said stock, and of the stock of the
 Company, transferred in trust to R. H. McDonald and re-
 issued to him by certificates, numbers 509 to 526, both in-
 clusive, for 100 shares each, and the same now stand in his
 names as aforesaid; and the stock above specified now de-
 linquent for said assessment, forms a part of said stock
 now standing in the name of said R. H. McDonald, as
 above stated.]

And in accordance with law, and an order of the Board
 of Trustees, made on the fourth day of October, 1886,
 so many shares of each parcel of said stock as may be
 necessary will be sold at public auction, by Messrs. Olney &
 Co., at No. 418 Montgomery street, San Francisco, Cal-
 ifornia, on Tuesday, the twenty-seventh day of November,
 1886, at the hour of 12 o'clock M. of said day, to pay said de-
 linquent assessment thereon, together with costs of advertis-
 ing and expenses of sale.

H. B. CONGDON, Secretary.
 Office, 620 Washington street, (Room 5) San Francisco,
 California. nov10

George Washington Gold and Silver Mining
 Company, Silver Mountain District, Alpine County, Cal—
 Assessment No. 15.

Notice is hereby given, that at a meeting of the Board of
 Trustees of said Company, held on the sixth day of
 November, 1886, an assessment of two and one half dol-
 lars (\$2.50) per share was levied upon the capital stock of
 said Company, payable immediately, in United States gold
 and silver coin, to the Secretary, at the office of the Com-
 pany only.

Any stock upon which said assessment shall remain un-
 paid on the eighth day of December, 1886, shall be deemed
 delinquent, and will be duly advertised for sale at public
 auction, and unless payment shall be made before the day
 of sale, on Monday, the twenty-fourth day of December, 1886,
 to pay the delinquent assessment, together with costs of
 advertising and expenses of sale. By order of the Board
 of Trustees.

A. G. WOOD, Secretary.
 Office, 538 Montgomery street, San Francisco. nov10

La Blanca Gold and Silver Mining Company,
 District of Ures, State of Sonora, Mexico.

Notice.—There are delinquent, upon the following de-
 scribed stock, on account of assessment levied on the
 fourth day of October, 1886, the several amounts set op-
 posite the names of the respective shareholders as follows:

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
141 San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction wherever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to
KNAPP & GRANT,
—ALSO— San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can do more track work in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind.
For sale by
KNAPP & GRANT,
124 1/2 3rd St. San Francisco.

To Ditchmen, Millmen and Others Requiring
IRON PIPE.

M. R. ROSE, CORNER OF 9TH AND K STREETS, Sacramento City, has facilities unsurpassed on this coast for the manufacture of IRON PIPE of every description. He also has on hand a deep well FORCE PUMP, of his own invention and manufacture, well adapted for oil wells. His tools being portable, pipe can be manufactured on the ground.
1912

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

We receive, regularly as clock work, this exceedingly valuable and interesting journal.—[Napa Reporter.]

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Grand Mining Undertaking in Butte County.

The following article, which we quote entire from the Marysville Appeal of Oct. 24th, shows that our people are still alive to the fact that there is yet other mining to be done than that of quartz. The extensive enterprise here described, the famous Blue Gravel mine, and the mills now being erected in Placer county for the working of cement, all suggest the probability that these deposits of an earlier period are yet comparatively unprospected; and inventors may yet find here a field for the exercise of their talent, in devising more complete apparatus for the working of mines of this description:

The most extensive mining operations in California lie north, near twelve miles distant from Oroville. Crossing the Feather river at Oroville and passing through Thompson's Flat there is to be found some of the richest surface mining in the State. But unfortunately there is so little fall that the mining in this locality is of the most primitive character, but still produces large quantities of the precious metal. Thence you proceed northeast under the lower Table Mountain, crossing Morris Ravine, which divides the two Table Mountains. This ravine is several miles in extent, and has produced immense quantities of gold, and is still worked with great success when water is to had—the present supplies being collected from the surrounding mountains during the winter season. There is one Eastern company now operating on this ravine, from whence you ascend to the upper bench or upper Table Mountain, at the northern end of which is what is known as

CHEROKEE FLAT.

This bench or table land, extending from the Sacramento Valley on the west through the foothills to the Cherokee bench, and for several miles north of Table Mountain, and on the eastern side of the mountain to the gorge that forms the head of Morris Ravine, a distance south of about seven miles, is one continuous range of gold-bearing gravel, which extends through the Table Mountain and is very rich in fine gold. To take a pan and wash this gravel reminds one of the good old days of '49; and it is not in selected spots only that these prospects are found, but in many places where one, who would consider himself an expert, would not think of prospecting. The surface of the country is quite barren, being dotted with an occasional nut pine and small scrubby oak; but sufficient for the miner's use, except lumber, which is of easy access. The mines at this place have been worked by rocker and sluice since the earliest days of California mining, and yet no impression has been made, from the fact that the only water to be had was during the rains, which is collected into reservoirs; and then thirty days work with water is considered an extra good year, and for as much as two years in succession there has been sufficient water for general mining. The mining ground everywhere in the vicinity has been located, the most of it for years, the locators waiting for the good time to come, when some enterprising company would introduce water. The most prominent mining company having the most available location, is the

CHEROKEE COMPANY—TEN SHARES.

The grounds of this company consist of 180 claims, consolidated together, of 100 feet square to the claim. This is the oldest company in the district, which has from time to time purchased adjoining claims, with the results of the joint labor of the members, until it has become one of the most valuable mines in the State. They are now working (during the rainy season) a bank of some forty feet in depth, composed of light quartz gravel, which is very rich, paying last winter as much as \$1,000 per day with a very primitive mode of working. They only had water thirty days all the season. The same gravel, with the improved mode of working in use in parts of Yuba county, would certainly pay 50 per cent. more, not from the same quantity of gravel, but from the additional quantity washed. This bank of fifty feet now being worked might be considered only the surface; as years since, when they commenced, they started from the bed of the ravine, and followed up on that grade. From prospecting shafts sunk, it is ascertained that the next twenty feet is of a more decomposed gravel, and then the famous blue gravel and cement is found, which continues to the bed rock, which is thirty feet, making in all, if properly opened, a bank of 100 feet and more, of the richest gravel in the State. This gravel range extends under the Table and Sugar Loaf mountains, forming a ravine between them, known as the Sawmill ravine, at the mouth of which is located the Welch Tunnel and hydraulic claims. This tunnel is run 600 feet under the foot of Table Mountain, where is found very rich gravel, which, with the hydraulic works, with the very limited supply of water last winter, paid ex-

travagantly—even as well as the Cherokee, for the chance they had for working. There is another company running a tunnel under the Table Mountain, under the superintendence of Mr. Waldeyer. This tunnel has been run 1,700 feet, and is still progressing. The Eureka Company are also running a tunnel under the mountain. They are in some 900 feet. Some of your readers may think it strange that such a rich territory as spoken of should have remained so long without the introduction of water. In reply we might say, that for the past twelve years different parties have examined the route for a canal, which is, or has been considered favorable until you come within a few miles of Cherokee. There you find a depression of some 600 feet to cross. This has always deterred any parties from making the investment, and by many parties considered impracticable, until this spring, when Mr. R. H. Payson and Mr. A. F. Williams visited the locality, first thoroughly examining the extent and value of the mines, then the feasibility of introducing water from some of the branches of Feather river, when, after several surveys by Mr. Orlando Jennings, a line of canal was partially settled upon, provided the company to be formed could secure sufficient quantity of mining ground to satisfy the investment, without depending upon the sale of water to the miners to reimburse them for their investment. After considerable negotiations, they have secured some hundred and fifty acres of this gravel mining ground, in the immediate vicinity and adjoining the Cherokee Company's grounds, including the key and great outlet to the Sacramento Valley, with its full of near 1,000 feet, including also the most of Sawmill ravine, running on either side, under and into the Table and Sugar Loaf mountains, and extending to Morris ravine, near and on which they have secured nearly 200 acres more of the best of this gravel range. That portion of the company's ground lying clear of the Table and Sugar Loaf mountains is nearly one and a half miles in length, and three-eighths of a mile in width, through which the gravel varies from twenty to two hundred feet in depth, and as you work up and into either of the mountains increases to as much as 600 feet in depth, and not surpassed in value by any mine in the State. Messrs. Payson, Williams and Jennings, as surveyors and engineers, have devoted the entire summer in prospecting, investigating, selecting and consolidating this ground, and selecting the route for a canal.

There has been several routes tested—one from the West Branch of Feather river. This line will require as much as five miles of iron pipe, perhaps forty inches in diameter, to convey the quantity of water desirable. Another and more feasible route, is from the North Feather river. This line takes the waters from the river at a point known as Shore's Bar, distant by line of canal about twenty-five miles to the West Branch of Feather river. To convey the water across this stream, and land it sufficiently high on the Cherokee side, of the stream to be available for all of the mining ground, a depression of nearly 700 feet has to be overcome, requiring a span of about 600 feet, elevated nearly fifty feet above high water mark. It is not yet determined whether this span shall be a wire suspension or wood work. The water will be carried across this depression on suspension or trestle work, in an iron pipe thirty-eight or forty inches in diameter in the clear—considered sufficiently large to convey 1,200 inches, miners' measurement, with ten inches pressure at the gauge box. This pipe will be two and one quarter miles in length, extending from an elevation on the north side of the West Branch of Feather river down the mountain, then crossing the river on the suspension spoken of; thence up the mountain again on the south side, to an elevation sufficiently high to convey the water to any part of the Table and Sugar Loaf mountains and Sawmill and Morris ravine. The receiving end of the pipe can be placed so as to give as much as 300 feet head above the ejecting end.

This is the greatest mining enterprise ever undertaken in California, and will require as much as two years to complete the work. Most of the iron for the pipe will have to be procured in the East, and more than one half million of dollars will be required to build a tunnel, make and set the pipes and open the claims. This is independent of what may be paid for purchase of lands, and other mining facilities. Of the financial result of the operation, there can be no doubt. The extensive gravel ranges belonging to the company have been so thoroughly tested by experienced practical men, who have devoted several months in investigations and tests, that with the introduction of water and the adopting of the improved modes of working hydraulic diggings, the yield of gold from these mines will certainly triple that of any mines now in operation in the State—the famous Blue Gravel not excepted. To H. R. Payson, Louis McLane and A. F. Williams with Mr. Orlando Jennings, as Engineer and Surveyor, will the people of northern California be indebted for the inception and completion of this vast enterprise.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.

For further particulars, inquire of,

At the Golden State Iron Works, No. 19 First street, San Francisco.

CAUTION!

NOTICE.—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1864, and issued June 27th, 1865, to Professor HENRY WURTZ, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY, OF NEW YORK, Assignees of letters patent granted to Prof. HENRY WURTZ, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand. The terms and conditions upon which rights to use the process are obtainable, can be had on application to WM. KLOSSON, Agent of the Company, Union Iron Works, corner of First and Mission street, San Francisco. 3v13

NEW YORK PRICES.

C. E. COLLINS, No. 603 Montgomery street, San Francisco. EXCLUSIVE AGENT FOR THE AMERICAN WATCH FACTORY. A large assortment of these Superior Watches, In Gold and Silver Cases, Constantly on hand, and sold at Factory prices. Also, ENGLISH AND SWISS WATCHES, Imported directly from the Manufacturers. The American Company are now making VERY FINE WATCHES FOR LADIES. A large assortment of Gold Chains and Jewelry. 25v10-6m

TIME & LABOR SAVED BY USING

STANDARD SOAP COMPANY'S WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for washing in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lb bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 15v12i

A Large Assortment of Trunks, Valises, Carpet Bags, Blankets, Etc.,

AT EXTREMELY LOW PRICES.

J. R. MEAD & CO.,

Cor. of Washington and Sansome streets. 8v10

THIS CUT REPRESENTS AN AMALGAMATOR and Separator that has stood the test of more years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the latter Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the miller under the stationary frame) against the amalgamated copper plate that are fastened to the frame, and by this means catching the due gold and mercury that will not settle.

4th. The gate in the cover, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

ISRAEL W. KNOX, OR

W. A. PALMER, Inventors,

At the Golden State Iron Works, No. 19 First street, San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, so piece being larger than a walnut—price \$600 No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour. 850 No. 3—Or 18-inch Crusher, in a similar manner crush from seven to eight tons per hour. 1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient light to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary parts of the crusher. A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated. The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Maricopa county, by Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAVINNE RANCH, Tuolumne Co., Sept. 28, 1865.

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1861. Further particulars will be afforded on application to the subscribers.

The following patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanation, of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

REPORT

OF THE—

COMMITTEE

—ON—

SEWING MACHINES!

California State Fair, 1866:

"TO THE PRESIDENT OF THE STATE AGRICULTURAL SOCIETY: Your Committee on Sewing Machines beg leave to report that we have examined the several Sewing Machines on exhibition, (the Grover and Baker, the Wheeler & Wilson, and the Florence,) and find that

FOR GENERAL FAMILY USE

—THE—

"FLORENCE"

—IS—

"THE BEST."

(Signed) J. N. ANDREWS, THOMAS C. McHALE, L. ELKUS.

If there is a FLORENCE SEWING MACHINE within one thousand miles of the San Francisco Office, that is not working well and giving perfect satisfaction, it will be attended to, if I am informed of it, without expense to the owner.

SAMUEL HILL, General Agent, 111 Montgomery street, San Francisco. 17v13

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

RAISED EYE QUARTZ PICK.—We examined with some care quite an assortment and variety of picks at the workshop of Mr. John Wright, in this city, and wish to call attention particularly to the *raised eye quartz pick*, noticed in his advertisement. This pick is made of the very best material, is unsurpassed by any other in the market in point of strength, durability and efficiency, and is specially adapted to the wants of the quartz miner.

CLOTHING EMPORIUM.—Miners and others visiting the city will find it to their advantage to call at Quincy Hall, where every kind of suit can be had or made to order on the shortest notice. About forty hands are kept constantly employed in manufacturing. For further particulars see advertisement.

THE FIRST RAIN of the season came to us on Friday night of last week. The amount which fell in this city measured .25 inch. Several showers have since fallen, but not sufficient to warrant us to expect more than an ordinarily wet season.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. SMITH, M. D., Consulting Physician; R. S. MACHIN, M. D., Attending Physician; W. G. W. HANFORD, Manager; H. ANDREWS, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings. 16v13-1f

To Owners of Mineral Cabinets.

A miner in Nevada has a lot of choice Crystals, which he desires to dispose of at reasonable rates to parties who may desire to complete their display of minerals. Address the office of the "Mining and Scientific Press." 19v13-4fc

Job Printing Press for Sale—\$250.

A Largest Size (half medium) RUGGLES' BEST JOB PRESS, in fine order and good as new, can be had for \$250, cash—lowest price. Warranted. Apply to DEWEY & CO., Mining and Scientific Press Office.

Bell's Assay Office.

THE UNDERSIGNED, HAVING FORMED A PARTNERSHIP this day, would inform the former patrons and the public generally, that they will continue the ASSAY BUSINESS in all of its branches, at the old stand, No. 512 California street.

One door west of Montgomery, San Francisco, with the same employees, under the name of Rogers & Brown. MR. EDWARD WOLFE, for the last seven years Assayer for Mr. Bell, will have charge of the Assay Department.

The Melting Department will be under the charge of MR. HENRY J. FISHER, for ten years in the United States Mint in this city and Philadelphia, and for the past seven years with Mr. Bell.

We would inform Photographers that we are prepared to work their chloride of silver and ashes from their paper clippings.

We have, in connection with our Assay business a Mill, and are prepared to

WORK GOLD AND SILVER ORES,

In quantities from 25 to 500 pounds; also, Assayers' Sweeps.

GEORGE E. ROGERS.

H. W. BROWN.

October 13, 1866. 19v13 q1pnr

Metallurgy.

KUSTEL'S NEVADA & CALIFORNIA PROCESSES

—OF—

GOLD AND SILVER EXTRACTION.

THE MOST VALUABLE WORK ON THE SUBJECT ever published, and indispensable to Miners, Prospectors, Metallurgists, and Millmen. Price, in cloth, \$5; sheen, \$6. Sent by mail, postage paid, 50 cents extra. For sale by Booksellers generally.

Scientific Books.

Always on hand, a complete assortment of Works in every branch of SCIENCE and the USEFUL ARTS, together with a full stock of Books in every department of Literature.

—Prompt attention paid to orders by mail.

MOYNIHAN & AITKEN.

HEPBURN & PETERSON'S PANS AND SEPARATORS.

For Reducing and Amalgamating Gold and Silver Ores.

We invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference, which facts we offer as the most suitable recommendation, and which is attested by the following list of

Principal Mills Using them:

Names of Companies.	Location of Mill.	Names of Companies.	Location of Mill.

NOTES OF TRAVEL.

NUMBER TWO.

The east and west sides of Lexington cañon present unmistakable evidences of dissimilarity in lithological character; and the cañon itself evidently owes its origin to a fissure of upheaval, the opposite sides of which represent respectively a metamorphic cretaceous deposit and an unaltered sandstone. These distinctive geological characteristics have in turn produced an equal dissimilarity in the topography and botanical productions of the opposite. The western, which consists of sandstone was but recently covered with a heavy forest of pines, firs and oaks, beneath which flourished a dense mass of undergrowth, sustained by a soil of almost unsurpassed fertility for a mountainous section, and well watered by numerous springs; the eastern slope presents the bleak and dreary aspect due to the scanty earth-covering of a metamorphosed rock, highly trappean in character, and is clothed, for the most part, with chaparral or "chamisal," with here and there a few stunted fruit trees.* The cañon forms the bed of a small stream known as the *Los Gatos* (Cat) creek. For quite a distance along its western slope, strong indications of petroleum occur at frequent intervals; while just across the creek we find numerous indications of copper.

A COPPER MINE.

A considerable amount of copper, according to report, has recently been taken out at a point on the east side of the creek, about half a mile distant from it, and some three-quarters of a mile from Thomas' saw mill. The discovery appears to have been kept quite secret; but after considerable inquiry and search, in company with Mr. Thomas, we succeeded in finding this locality. There was no one at the mine at the time of our visit, but we noticed that considerable prospecting had been done by running drifts under a large out-crop of decomposed mundic. So far as we could ascertain from a hasty observation, there was no indication of any vein, although there was quite a display of carbonates, and some very good looking sulphurets lying at the mouth of one of the openings. The prospect is such as might possibly warrant the expenditure of a small additional amount of money for further exploration. The chances of finding anything of value, however, we should think, are extremely doubtful; although for the sake of the neighborhood and the enterprising miner who has been so indefatigable in his efforts to discover a workable vein of copper in that cañon, we most heartily wish him the fullest success.

THE OIL WELLS.

In this cañon, which at one time presented such fair indications of success, seem now to be entirely abandoned. We visited several of them, and among others the McClellan well, from which considerable oil has been sent to this city. The derrick, steam engine, boring tools, tanks, etc., appear to have been left to destruction and decay. The well, we believe, was sunk to a depth of about 250 feet.

*The proper meaning of "chaparral" is a dense undergrowth of scrubby oaks; the undergrowth which usually covers the Coast Range of mountains is composed almost exclusively of "chamisal," the *Adenostoma fasciculata* of the botanists, and is more properly denominated "chamisal," than "chaparral."

To those who will take into intelligent consideration the vast amount of disturbance which must at some time have been exerted in this vicinity, and by which the stratification has been uplifted and left in an almost vertical position, it does not appear at all strange that no considerable quantity of oil should be found in this locality. Within less than half a mile southwesterly from this well, the geologist will recognize indications of plutonic action to an extent which has effected a complete metamorphism of the cretaceous formation which lies in immediate and almost vertical juxtaposition with the oil shales and sandstones. The strata here are simply saturated with oil, and their vertical position must render it extremely impossible that they should contain any considerable reservoirs of that liquid; or that it could be successfully obtained by percolation into well borings or other openings in the strata.

MINING IN THE COAST RANGE.

The upheaval of the Coast Range of mountains has taken place at too recent a period to admit of anything like aggregated and continuous metallic veins, such as are found upon the flanks of the Sierra, whose upheaval is referred to a much earlier date. Cinnabar may be, and is found there in large quantities, from the fact, most probably, that that mineral does not occur in continuous veins like gold, silver or copper; but always occurs in bunches or pockets, connected at irregular intervals and in diverse directions by threads or strings, and often entirely disconnected and unaccompanied with any continuous matrix whatever. Hence, we consider any prospecting in the Coast Range of mountains, throughout the central and southern portions of the State, for any other mineral than cinnabar or coal, as very little better than money thrown away. The aggregation of metalliferous veins, whether by sublimation, infiltration or otherwise, is the work of time, as counted by geological periods. The Sierra Nevadas have reached the age requisite for each aggregation. The Coast Range is still in its minority, so to speak. Should the consummation of all things be deferred for a sufficient length of time, the people of some future age may find in these mountains similar mineral developments and aggregations as are now being unfolded by the miners upon the slopes of Sierra Nevada. But before that event shall transpire, it is possible and even probable, that more than one growth of forest giants, whose period of germination, flourish and decay, shall be equal to that comprised in the existence of our present mammoth groves of sequoias, will have come and gone.

(To be continued.)

QUARTZ REDUCTION AND ASSAYING. — We would call the attention of our readers to the card of Messrs. Rodgers & Brown, successors to the late Mr. G. W. Bell, in the assaying business, at the old stand, 512 California street, in the rear of Wells, Fargo & Co. Messrs R. & B. are prepared to attend to any orders in their line, and to give practical working tests of gold and silver ores in lots from 25 to 500 pounds each. Their assaying and melting departments are in the hands of experienced and trustworthy persons, who have been long and favorably known in this community in their particular departments of assaying.

ANOTHER IMPROVEMENT.—The indomitable Hendy has made still another improvement to his concentrator. The old Prater machine, with which he started, has, in his hands, become so changed that Prater himself would scarcely be able to recognize his original invention, were he to examine the machine which Mr. Hendy now offers as his Patent Improved Concentrator and Separator. By this new improvement, Mr. Hendy dispenses entirely with the conical feeding distributor, which covers up and shuts out from the observation of the amalgamator the most critical portion of the work of the machine. In the present machine a hollow arm, with a T upon its outer extremity, is affixed to the hopper, which, with the arm, is made to revolve, like the hand of a watch when laid upon its back. The sand from the battery is made to pass into the hopper, as in the old machine, and from thence it is conveyed through the hollow arm to the periphery of the concentrator, where it enters into the T, and by which it is uniformly distributed, more so than it has been found practicable to be done by the conical disk heretofore used. A set of stirrers is also put in motion, which just scratch along, with a rotary motion, upon the top of the sand, for the purpose of preventing its liability to pack. By dispensing with the conical covering, the amalgamator is enabled to keep a constant watch upon the operation of the machine, and see that it is working right, and without packing. This improvement can be attached to the Hendy Concentrator now in use.

VEGETABLE GROWTH IN CALIFORNIA.—Among the peculiarities of this climate, is the fact that it permits the cabbage plant to grow from year to year until it becomes an evergreen tree. One consequence of this is the hardening of the wood of the stem or trunk. Mr. J. H. Benton, of Gold Run, Placer county, recently had a cann manufactured from a cabbage stalk, which he took to New York, where it attracted considerable attention. The editor of the *Druggists' Circular*, who has seen it, says it appears to be as sound and hard as hickory. It is finished with a simple coat of varnish, and is easily mistaken for some rare specimen of real wood. The writer has, himself, seen the same thing in Oakland. The castor bean, which in other countries is an annual, here becomes a large tree, with a fine growth of wood. We made mention of this novel cane, some months since, when it was exhibited in the office of the PRESS.

THE EXPECTED METEORIC DISPLAY didn't come off. Probably November, 1867, is the time, after all. Professor Olbers thinks so, inasmuch as the time which elapsed between the two previous showers was thirty-four years. The idea that the period was one-third of a century, is the natural consequence of our proneness to generalize without sufficient data. Several returns must occur before we can, with any degree of certainty, determine the period.

AN IRON CLAN FORT is about to be erected on the coast of Texas, near Galveston. It will mount twenty heavy Parrot guns, and will no doubt prove quite impregnable.

PRIVATE TELEGRAPHS.—We notice that several of our enterprising citizens whose business is such as to require in-town and out-of-town establishments, have connected the two with lines of telegraph for the purpose of more speedy and convenient intercommunication. We observe a wire stretched from the business house of T. H. Selby & Co., on California street, to their shot tower and lead pipe manufactory on First street; also another—the assay house of Kellogg & Hewson, on Montgomery street, to their gold and silver refinery on Brannan street. The St. Ignatius College, on Market street, we believe has also a direct telegraphic communication with its sister institution at Santa Clara; the connections, as we have understood, is by branch wires at either end connecting with one of the main public lines between this city and San Jose. The San Jose Railroad Company, also, has a private line of telegraph stretched along its line of road, connecting the depot in this city with that in San Jose, and all intermediate stations, by which the starting of trains and their junction, or any accident on the road, may be readily announced at any station on the line.

If we are not mistaken, the first enterprise of this kind in California, was got up some two or three years since by Mr. Ott, the well known assayer of Nevada City, for connecting his assay office in that city with his residence. Private telegraphs of the above description are quite common in the Atlantic and European cities, and long experience has proven them to be of great convenience and practical utility.

THE NEXT GREAT EXHIBITION, after the Paris exhibition of 1867, will be held in 1870, at Vienna, the capital of Austria. The manufacturing institutions of Austria have been so severely injured by the late war, that the participation of that country in the Paris exhibition has become very doubtful. The most busy manufacturing provinces of the empire, Bohemia and Moravia, have been literally ravaged by the Prussian occupation. A large number of objects intended for the exhibition at Paris, have been carried off by the Prussians; and again, the exactions and the contributions of all kinds that were levied, have been such as to place it beyond the power of the manufacturers to make those fresh sacrifices which would be required to maintain their credit in the general competition of 1867. Rather than present themselves in a position of lamentable inferiority, the Austrian manufacturers prefer to abstain from appearing at the Paris Exhibition, and to reserve their powers for the great exhibition which will be conducted under their own auspices, at Vienna, in 1870.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

A Sea of Fire.

The whole western slope of the North American Continent, particularly that portion near the Pacific Ocean, must, at no remote period, have been the scene of an intense volcanic activity, of which we have unmistakable evidence in the upheaval of the Coast Range of mountains—the elevation of the Sierra Nevada, with its summit studded by volcanic cones, and its westerly slope marked with ancient river beds and valleys, filled for hundreds of miles with volcanic ashes, pumice, scoria and basaltic lavas. The usual phenomena accompanying violent and extensive volcanic outbursts were probably not wanting at that period. The earth's surface undulating like a troubled sea; deep fissures and chasms opened in the solid rocks, through which thermal springs and evolutions of sulphuric and mephitic vapors, electric matter and inflammable gases, were constantly emitted; mountains rent in twain; rivers turned from their courses, seeking new channels; lakes dried up or swallowed by yawning abysses opened to receive them; new lakes formed; the whole configuration of the country changed; the shores of the Pacific removed some sixty miles westerly; its placid waters maddened and tossed by violent earthquakes, receding, surging and foaming in mountain waves, striving to surmount the new barrier and regain its lost ground and familiar shores; torrents of water and mud, pouring down from the mountain sides from excessive rains and sudden melting of immense glaciers and mountains of snow, inundating the country; a war of the elements—Fire vs. Water; unearthly, terrific and appalling sounds; dense clouds of ashes and volcanic dust obscuring the heavens; red, lurid and unearthly lights seen emitted from inflammable gases, and at intervals spasmodic volcanic eruptions, lighting up the whole country with a light so vivid and intense, that the sun would have paled were it visible; huge masses of molten rocks, hundreds of tons in weight, thrown high in the heavens, their surfaces contracting on meeting the cooler atmospheric air, and exploding with deafening reports, scattering their thousands of fragments of bright, glowing masses of fire in every direction—a pyrotechnical display shaming man's puny efforts; molten lava-streams rolling down the mountain sides with irresistible force, cutting down extensive forests of mammoth trees with less effort than the farmer exerts in removing his grasses, and melting down hills in its onward and downward flow. Under all this superficial disturbance and commotion lay its counterpart—the irresistible and invisible power that produced the effect.

ONE VAST SEA OF MOLTEN LAVA,

Contracting and expanding under the immense pressure of the earth's crust, submerged and tossed about by the expansive forces of its highly heated and elastic gases, struggling to escape from their rocky embrace. This wreck of matter and crush of worlds must have produced an effect indescribable; and one that Milton, with all his vivid and descriptive powers, would have made but a feeble attempt to portray.

That this terrible convulsion must have been preceded by premonitory symptoms, affording time for animals to escape from the mountain ranges, there can be no doubt, as the ancient river channels are almost entirely destitute of animal remains big up in the Sierras. That animals existed there, and inhabited the densely wooded forests with which the mountains were covered, we have abundant proof. The fossilized remains of the timber of those early forests are found in the lava-covered channels.

To what is now known as the foot-hills—then the sea coast—these animals undoubtedly rushed, in terrified, frantic and countless herds, seeking the cooler atmosphere of the sea, but to meet a frightful and horrible death, from which there was no escape. They were then overtaken and engulfed by streams of molten

lava or floods of mud and water, or destroyed by mephitic vapors and poisonous gases, that probably extended over the entire continent, and accounts for the sweeping destruction of whole races of men that have once inhabited, not only the North but the South American Continent as well, of which we have no traditional or historic account. Their ruined towns, fortified cities, pyramids and extensive aqueducts, prove them to have reached a high state of civilization—silent monuments of their previous existence.

In the Lake Superior copper mines masses of metallic copper are found detached, and the tools that were used by the workmen, of copper and stone, lying by their sides, but no traces or remains of the miners' existence. In the Western States, pyramids and mounds and ruins of ancient cities are found; in Mexico, ruined towns and walled cities, covering large areas, of which the aborigines have no tradition; in South America, abundant proof of the former existence of a race much superior and farther advanced in the arts and sciences than any of which we have recorded, and of which tradition is silent.

The writer once visited a ruined, walled city in the interior of Peru, South America, covering an area much larger than the city of New York; its ruined walls and labyrinth of streets, its public edifices and household utensils, denoted a high state of civilization; and that its inhabitants perished by a sudden and violent death is proved beyond peradventure. An immense field of many acres in extent, adjacent to the city, is covered with their remains—skeletons of men, women and children lying in groups, pairs and singly—here a male and female lying side by side—there a mother and her child. Some of the male skeletons are of giant proportions. That this was no Golgotha, is proven by places devoted to that purpose, within the city limits, filled by small raised mounds. Should it be proven that this terrible and sweeping havoc of destruction spread over this continent at a time contemporaneous with the scenes described, it would account for many unexplained phenomena. That we do not find authenticated evidence of the remains of human species on this continent, does not prove that man had not made his appearance here. That the fauna preceding this destructive outburst was dissimilar to that which succeeded it, does not militate against the previous existence of man, as recent investigations and discoveries have given good grounds for believing that man existed on this continent at least as late a period as the post-Pliocene. See Whitney's Geological, volume 1, pages 251 and 252.

VIADJOR.

A GOON SUGGESTION.—The Calaveras *Chronicle* proposes to the citizens of Mokelumne Hill to give each week, as they can afford, so much money, for the purpose of developing some one mine in the neighborhood. There are one hundred men here, says the *Chronicle*, who could easily average one dollar each a week, which would be sufficient to keep two shifts constantly at work until a mine was either proved valuable or worthless. This amount should be donated to the owners of the mine, to be used economically in the prosecution of the work, in case it proved of no value; but if it turned out good, then after the necessary machinery was erected, and the claim paid a dividend, it could be restored to those who subscribed the fund. We have begged for capital for years, continues the *Chronicle*, we have prospected as long, and yet we have neither capital or developed mines in the county. We must now go to work in earnest, and show the world what riches we have in the bowels of the earth, and we know of no better way than the manner we have suggested above. One valuable quartz mine would make the fortune of the county; without one we shall soon be hopelessly in debt. We think the people in several other mining sections would do well to act on this hint.

THE LINCOLN HOUSE, at Portland, is said to be one of the largest and most popular hotels in Oregon, and to be conducted on the most liberal principles.

PROCESS OF ROASTING ORES, ETC.

Translated from the German of F. Plattner, for the Mining and Gas-Light Journal, New York.

BY J. H. TIEMANN, M. E.

NUMBER ONE.

INTRODUCTORY REMARKS.

The treatment at a high temperature of ores as they come from the mines, or of such as have been subjected to the process of concentration, as well as of such products as have been obtained metallurgically from sulphur or arsenical ores, which serves to prepare them for further metallurgical operations, is called Roasting. Roasting has for its object, by the action either of air alone or in combination with chlorine gas, chlor compounds, steam, etc., upon the ores, the production of such chemical changes as are necessary for the further working of the ores.

The old technical term of "Calcining" or "Burning," is also sometimes used for such preparation of the ores. The term "Calcining" is derived from the burning or heating of limestone, which, at a bright red heat, gives off its carbonic acid, for which purpose the admission of atmospheric air is not absolutely necessary. In former times, as it was not known that the oxygen of the air performed the principal part in roasting ores or mill products, for the purpose of expelling certain components, as sulphur and arsenic, there was no difference made in the roasting process with or without the admission of atmospheric air. This term was consequently used, not only for such ores, which consisted of metallic oxyds, in which the oxyd was chemically combined with water or carbonic acid, and from which they could be freed by the simple application of heat, as, for instance, many iron and zinc ores, but was also used for such ores as contained combustible compounds, and which, consequently, could only be prepared for further treatment by the admission of atmospheric air, at a high temperature. The term "Burning" was used more frequently to designate the roasting of such ores which, in the form of large or small lumps, were to be more or less freed from their combustible compounds, and where the "Burning" was repeated, atmospheric air being admitted, till the volatile or combustible compounds were removed as far as necessary, and the remaining components decomposed sufficiently for further treatment.

The objects of roasting are various, depending upon whether the substance, after it has been roasted, is to be treated by one or the other method; whether each remaining component is to undergo a certain change, or whether it be desired, during the roasting, to separate certain components in the form of gas, to be recovered by condensation. For many ores and mill products it is advantageous, and in many cases, absolutely necessary that, before roasting, they should be reduced to powder, if not already in that condition from previous treatment. For many other ores and mill products, on the contrary, it seems to be better that they should undergo roasting in lumps, of proper size, not only because in such cases there is economy in fuel, but because such ores after their roasting, provided the metal is not liable to be driven off in vapor, as, for instance, quicksilver, may be more profitably worked than when in the form of powder.

By roasting, the following objects are effected:

I. The oxydation of such metals as are combined with sulphur and arsenic, or in general such metals as are combined with combustible matter, for the purpose of either forming free oxyds, or oxyds in combination with an acid, and to drive off, in the form of vapor, the residuum of sulphur, arsenic, etc., either in combination with, or free from, oxygen; again, if the substance to be roasted is a compound of metal and oxygen, i. e., an oxyd, it is often desirable to combine it with more oxygen, to subject it to a higher oxydation. As these results can only be obtained by the free admission of atmospheric air during the time that the substance is at such a temperature that its components are disposed to unite with oxygen, such roasting is termed an "Oxydizing Roasting."

II. The decomposition and changing, as far as possible, to free oxyds, the sulphur and arsenical metal oxyds formed in the oxydizing roasting of many finely pulverized substances. As, in many cases, it is disadvantageous to effect this by increasing the heat, or even impossible by the aid of heat alone, finely pulverized coal, or some substance rich in carbon and hydrogen, is added, the admission of air being for a time prevented, which causes a reduction of the sulphuric to sulphurous acid and of the arsenic acid to a sub-oxyd of arsenic and metallic arsenic—that is, a decomposition of the sulphuric and arsenic acid metal oxyds, and the removal of the resulting volatile compounds. During the volatilization of the reduced compounds,

carbonic acid and carbonic oxyd gas is formed, leaving the metallic oxyds behind in a free state—many of them, however, less highly oxydized. Such roasting is termed a "Reducing Roasting." If now atmospheric air be admitted, the remaining carbon burns to carbonic acid, and many of the metallic oxyds, which were reduced to a lower grade of oxydation, absorb oxygen again.

III. The combination of the metals with other bodies by the aid of proper admixtures. When in a roasting process, having for its object the oxydizing and decomposition of sulphur and arsenic metals, certain substances are added, as, for instance, the addition of salt, and, according to circumstances, sulphate of iron, to ores and mill products which are to be treated by amalgamation for the extraction of the silver, there ensues a chemical decomposition, new compounds are formed; sulphate of soda, together with different other compounds, the latter being more or less volatile. Such a roasting is termed a "Chloridizing Roasting."

IV. The complete evaporation of such parts of the ore as become volatile at a high temperature, as, namely, carbonic acid and the water of the hydrates, and, in many cases, the sulphuric acid of sulphates. Such roasting is termed "Evaporating Roasting." As, frequently, in the Oxydizing, Reducing and Chloridizing Roasting, it is at the same time the object to volatilize certain compounds of the substance roasted, so in the Evaporating Roasting, a distinction is made between (A) oxydizing Evaporating Roasting, (B) reducing Evaporating Roasting, (C) chloridizing Evaporating Roasting, and (D) the simple Evaporating Roasting.

Finally—

V. By roasting, many ores are rendered more friable, the heat destroying the cohesion of the particles among themselves, as many iron ores found in large masses, and tin ore. As this object can be attained by the simple application of heat alone, without the aid of atmospheric air, when the operation is not connected with any chemical decomposition of the accompanying sulphur and metals; such an operation is to be considered more in the light of a simple calcination, than of a roasting process.

If the object of roasting is to be fully accomplished, this can only be done by the fulfillment of those conditions under which it is in general possible, and to these conditions belong especially properly constructed furnaces and other arrangements.

Is it desired to fully oxydize the metals, and to remove at the same time the sulphur and arsenic which may be in combination with them, the pulverized ores and mill products must be roasted in a reverberatory furnace, having a horizontal hearth and a flat arch; the construction of the furnace may differ, but must always correspond with the end in view. The same applies to Reducing and Chloridizing Roasting.

If, however, it be desired merely to reduce such ores or mill products as are chiefly composed of sulphur metals, and not too rich in silver or lead, to a certain grade in their chemical composition, by roasting, this may be effected better, and with more economy in fuel, by roasting them in lumps of proper size. In this case, the roasting is carried on either in heaps, pits or kilns (rooms partly inclosed on the sides by walls), depending upon the character of the ore to be roasted, whether it oxydizes easily or with difficulty.

[To be Continued.]

A MUCH NEEDED INVENTION.—An invention is wanted in the chemical preparation of a thin tissue paper, so that by moistening it and using a hand press it will take an impression, and produce a copy of any written document, without any reference to how long the ink may have been dry on the original paper. To members of the legal fraternity, copyists and others, who are often required to make hurried copies of legal documents, such an invention would prove of immense advantage. Might not some "sensitive" paper of that kind be devised? It would of course be necessary that the chemical ingredients used should be of a character which would not injure the texture or materially impair the color of the documents to be copied. An eminent reporter of an Eastern paper has made the above suggestion, and we place it before our ingenious chemical friends for their consideration. In the present advanced state of chemical knowledge, it would seem as though such an object is not entirely beyond the range of possibility.

THE diminution of the magnetic dip has been going on in London for the last half century, with great regularity, at the rate of about three minutes annually.

Mechanical.

A CEMENT FOR IRON—REMARKABLE STATEMENT.

In our issue of January 20th we gave a lengthy detail of a remarkable invention by Col. N. C. Seezerelmei, a Hungarian gentleman residing in London, of a substance denominated by him "zopissa." The substance was used to saturate paper and fibrous substances, by which they were readily converted into pipes, slabs or boards, etc. It was stated that a board one inch in thickness, manufactured of this material, presented more resistance to a cannon ball than a 6-inch oaken plank. The material could be thus prepared in sheets 100 feet long, and were said to be almost or quite equal to iron for plating ships of war. Indeed, they might be affixed directly to the frame work of a vessel, and thus constitute its only covering. The material is light, water-proof, and non-absorbent. When made into pipes it is far more indestructible than iron itself; hence it was valuable for conveying water and gas. The water is not affected by these pipes. The material was just then coming into use in Europe, and the inventor promised many other new applications, as the result of further investigations. We have now just heard from him again, in the following remarkable statement, which comes to us through the medium of the *Iron Age*, of New York, evidently taken from some English paper, the name of which is not given:

A WONDERFUL CEMENT FOR IRON.

An exhibition of a most interesting character took place recently at the Albion Works, Battersea, England. The exhibition consisted of a number of practical illustrations, of the uses to which a certain description of cement is applied, having for its principal ingredient more or less of a particular gum or substance, called the zepipe—[It was called "zopissa" in the authority from which we quoted in January last.—*Ens.*]—which for some years past has been identified with the name of Colonel Seezerelmei. It appears to be a most protean substance, for it holds on with wonderful tenacity to timber, glass, brick, cement; and last, though by no means the least of its remarkable qualities, it will unite iron surfaces together as completely as though they were welded. The cement has the quality of being perfectly water and air tight. It can be conveniently used, and hardens with the greatest rapidity. About five minutes is the maximum of time required for it to harden thoroughly.

Of the value of such a material as this for engineering and building purposes, it is impossible to speak too highly. Our professional readers will at once perceive a variety of uses connected with railway and hydraulic works to which a material of this kind would be of the greatest possible value. Tunnels and bridges, docks and quay walls, could be constructed by its use in considerably less time and at greatly reduced cost; and with respect to sewers, an immense improvement would be effected in employing a material on which fluids produce no impression. Platform and railway stations could be provided of equal strength to the present and with less consumption of materials. The invention is one of that character with respect to which there can be no mistake, and any person who sees may judge for himself of the properties of the cement, and we shall be greatly mistaken if some of our large contractors do not very shortly seek to test the practical value of this remarkable "iron cement."

On previous occasions we have described the remarkable preservative qualities of the zepipe composition on stone and brick, and the extraordinary effects which the application of one part of the process has upon paper, converting it into a substance harder and more enduring than oak, and capable of being substituted for metals in many of the uses to which they are applied in the arts and manufactures. Following out the line of investigation into the chemical constituents of the substances which he employs, the gallant colonel has now succeeded in producing some results, which if they had not been shown under our inspection, we should have hesitated to believe possible. By combining various substances which may be readily obtained in large quantities, and at almost nominal prices, the ingenious inventor has made what he calls this "iron cement," and truly it is an iron cement. It is a cement which, easily applied, becomes in a few minutes as hard as iron, and, so far as we are aware, this is a quality which is not possessed by any other substance—that of complete and perfect cohesion to iron. At Battersea we saw two large plates of iron held together so firmly as to defy all attempts at

separating them. The plates had in several parts been fractured by the attempt to separate the two surfaces, but they still remained firm and immovable. Two plates of iron were cemented together in such a manner as that the lower one could have suspended to it the weight of several tons; the projecting corners of the lower plate to which the weights were attached were bent and curved, and the upper and lower plates had "buckled," but they still remained held together by the thin layer of iron cement as though they were but one plate. By the side of this a plate has been made up of alternate thin sheets of iron and planks of timber, and the wood and the iron adhered as firmly as in the case when iron surfaces only were exposed to the action of the cement. A third test consisted of thin sheets of iron with alternate layers of paper, which had been previously coated with another kind of composition of M. de Seezerelmei's. There the same wonderful cohesion existed. A sheet of glass was fixed to the edge of an iron bar by this extraordinary cement, and was as firmly held as the iron, or wood or prepared paper of the previous experiments with iron and wood. Many other equally curious and startling experiments were shown, and among these a novelty in the way of a house some forty feet in length, the sides, flooring and roofing of which were entirely of paper. The exhibition is certainly a most interesting and instructive one.

EFFECTS OF OIL IN A STEAM BOILER.—SINGULAR PHENOMENA.—In employing for the supply of locomotive water obtained from certain collieries, in Belgium, and especially those of Gilly and Charleroi, a singular phenomenon is observed as soon as the pressure of the steam attains six or seven atmospheres. The water mixes with the steam and escapes in the form of mist by the discharge-pipes; the feed-pumps become insufficient, and after a journey of some miles it sometimes becomes necessary to draw the fires. This effect is attributed to the presence of a matter which, under the influence of a temperature corresponding to five or six atmospheres, causes the liquid to rise. This matter arises, in the opinion of M. Stoelet, engineer, from coal dust held in suspension in the water, which dust comprises a certain proportion of oil. M. Stoelet sees no remedy but a careful system of filtration.

SOLDERING SOLUTION.—The following receipt is recommended for making a most excellent soldering fluid:

Two ounces muriatic acid, in which as much zinc is dissolved as it will hold, to which add half an ounce sal ammoniac. Clean the metal well and the solder will run and adhere to any part of the metal to which the solution is applied. It will also solder brass and steel together.

OREGON IRON WORKS.—The works of the Oregon Iron Manufacturing Company, consisting of a blast furnace with mining machinery, are located eight miles above Portland, on the Willamette river. They promise, when completed, which will be within a few weeks, to add greatly to the mineral product of the State. The iron ore is found both on the surface and in beds eight feet deep in abundant supply.

SPEED OF MECHANICAL FORCE.—If a continuous solid iron rail was laid along a track for a distance of 150 miles, no amount of force applied at one end could move the other in less than one minute and a quarter, the time required for mechanical force to travel in iron that distance.

SUPERHEATED STEAM, for the purpose of navigation and motive power, was first patented by Trevethick, in 1833.

A MONUMENT, costing \$18,000, has been erected over the grave of Wm. F. Harnden, the originator of the express business in the United States. It is a large and handsome structure, consisting of a covered platform, with a column of granite at each corner. The platform contains a granite safe of ordinary size, with a watch-dog reclining in front, and other suitable emblems. Mr. Harnden died in 1845.

TO FIX LABELS ON TIN.—Druggists and housekeepers are often annoyed by the labels falling from tin boxes and cans, when put on with ordinary paste. If they would use a solution of shellac in naphtha or alcohol, the annoyance would cease.

Scientific Miscellany.

Singular Molecular Changes.

Take the alloy known as Newton's fusible metal, composed of eight parts of bismuth, five of lead and three of tin; melt and pour it out upon a marble slab, and as soon as it becomes sufficiently solid and cool to handle, break it by a slight blow. The act of breaking it by a blow upon one part, will usually cause the whole to fly into quite a number of fragments, like glass. Immediately afterward the metal, which was easily handled before it was broken, becomes so hot as to burn the fingers, if taken up. When the evolution of heat has ceased, the alloy will be found entirely changed in character. From being extremely brittle, it will then require to be bent to and fro several times before it will break. The broken surfaces, which in the brittle state were smooth or conchoidal, with a tin white color, will now be found to present a fine granular or crystalline surface, of a dark color, with a dull, earthy aspect.

Similar phenomena accompany the melting and cooling of the fusible alloy of H. Rose, which is composed of two parts of bismuth, one of lead and one of tin. These facts were first observed and communicated to the public in 1842, by Robert Warrington, Esq., through the London Chemical Society. The fact of the evolution of heat from Newton's alloy, under other circumstances, had been previously alluded to by Berzelius, as follows: "If this alloy is plunged into cold water and quickly withdrawn and taken in the hand, it becomes sufficiently hot, after a few moments, to burn the fingers." We presume the plunging into cold water was done before the alloy was cooled to the ordinary temperature of the atmosphere.

These phenomena can only be accounted for by admitting a certain degree of mobility among the component particles, by which a second molecular arrangement takes place after the metal has solidified; this may possibly arise from their not having assumed, in the first cooling, that direction in which their cohesion is the strongest.

That a very marked and extraordinary alteration in the characters and properties of various metal arises entirely from this change in the position of their molecules, effected either by the communication or abstraction of heat after solidification, there can be no doubt. These changes, moreover, are applied to many very important purposes in the arts—such as the hardening and tempering of steel; the rolling of commercial zinc, and rendering that metal permanently malleable, the annealing of glass, cast iron, etc.—all of which processes undoubtedly depend upon the same principle as that involved in the curious phenomena above alluded to in the case of the bismuth alloys. A great variety of other uses, particularly in crystallization, might also be referred to.

CAUSE OF THE SMELL OF HYDROGEN GAS.—If hydrogen gas be made to pass into pure alcohol, it almost entirely loses its smell. Water added to the alcohol renders it milky; and on resting some hours, a volatile oil separates, which is the cause of the well known smell of hydrogen gas. This gas is obtained perfectly free from smell by putting into pure water an amalgam of potassium; but if there be added to the water an acid to accelerate the development of the gas, the latter will have the smell, which is observed during the solution of zinc in weak sulphuric acid.

LUTING FOR CHEMICAL APPARATUS.—The Druggists' Circular says that an excellent cement for luting chemical apparatus, and for other purposes, may be prepared by mixing paste made from starch with glycerine and gypsum. It will retain permanently its plasticity. By an addition of glycerine to glue (one-fourth part of the glycerine to one part of glue), the cracking and scaling-off will be prevented. This glycerine glue possesses also the property of exsiccating to remove the marks of lead pencil from paper.

SCIENCE IN THE DAIRY.—There are many dairymen who persist in thinking it a foolish whim, that the milk last drawn from the udder of a cow contains more cream than that first obtained. Yet, careful analyses have fully proven the correctness of the assumption. Schubler says the milk last drawn contains three times as much cream as that first procured. Dr. Anderson, in "Dickerson's Practical Agriculture," asserts that he found, by actual analysis, in one instance, that the last cup of milk drawn from an udder contained sixteen times as much cream as the first cup. The separation of cream from the milk takes place, in part, in the udder of the cow, particularly if the cow is suffered to stand at rest for some time previous to milking.

The exercise required of a cow which is driven a considerable distance, just before being milked, causes an increased play of her respiratory organs. The excess of oxygen thus respired unites with a portion of the butter, of which the cream is largely composed, and consumes it. The same is the case when a cow is barraged or in any way seriously annoyed, just previous to being milked. It should be a great care of all dairy farmers, to keep their cows as free as possible from every kind of annoyance, and thus prevent them from inhaling an excess of oxygen.

The animal heat evolved in the consumption of an excess of oxygen, more than is sufficient to act properly upon the blood, besides destroying the cream, also decreases the volume of milk, and elevates the temperature of the same to such an extent that acetous fermentation is induced which cannot be arrested even after the milk is taken from the cow; hence the milk is diminished in richness, and speedily becomes sour. For the above reasons, stalled cows, as a general thing, give richer milk than those suffered to run in the fields. For the same reason morning's milk is richer than night's milk. The quietness of night is favorable to the formation and preservation of cream. Repeated analyses have proven all the above facts. There is more philosophy in the dairy business than most people are aware of.

There are so many changes which are constantly occurring to the dairyman that cause variations in the value of his milk, even when the conditions of feeding are the same, as to render a chemical knowledge, or at least ready access to chemical experiments in this direction of the most economic and practical importance. It is true that the animal body is not a mere chemical laboratory, in which the chemist may operate as he pleases; for there is a power there—a vitality superior to his science; but by his intelligent concurrence with, and proper regard for that vitality, the changes and conditions which he desires can very generally be effected.

OCEAN TELEGRAPHY.—The contents of a lady's thimble would hardly be expected to constitute a very powerful instrument. They would scarcely have been thought capable of one of the most astonishing feats ever performed by science. The chairman, however, of the Atlantic Telegraph company informs us that this little instrument has actually achieved such a feat. By way of experiment, the engineer of the company joined the extremities of the two cables which now stretch across the Atlantic, thus forming an immense loop line of 3,700 miles. He then put some acid in a lady's silver thimble, with bits of zinc and copper, and by this simple agency he succeeded in passing signals through the whole length in little more than a second of time. A few years ago how incredible such a statement would have sounded! It seems, indeed, that the simplicity of the fact has taken even electricians by surprise. When a cable was first laid across the whole breadth of the Atlantic, it was anticipated that an unusually high power would be requisite to drive the current in sufficient force through such a length. In the first instance, therefore, they used a battery with fifty cells, and afterward employed 500 cells. But this extraordinary power only injured the cable, and the company are now working between Valentia and Heart's Content with a battery of only twenty cells. It is, in fact, remarkable how greatly the success of the present year has dissipated the supposed difficulties of distant or deep-sea telegraphy.—*London Times*, Oct. 1.

Mineral Resources of Sierra County.

As represented in Messrs. Crossman & Cochrane's Cabinet of Minerals, Downieville.

Believing that mining interests are always advanced by an exchange of facts and opinions by miners, and by comparison of samples of various mineral products in connection with the circumstances under which they are found, we give the following:

GROUP No. 1.—An area of about three miles, comprising quite a number of parallel veins, whose strikes are easterly and westerly. On the principal veins of this group there are several localities. The best representative location would be the

Sierra Buttes Mining Company.—Locality, Sierra Buttes. Three parallel veins—the Rose, Ariel and Cliff, each from eight to twenty feet. Veinstone, quartz—the first, rose-colored; the second, white laminated; the third is of a saccharoidal texture. Strike, easterly and westerly. Metals—auriferous, iron pyrites and a little galena. Formation, metamorphic slate.

GROUP No. 2.—An area of considerable extent. **Sierra Buttes Copper Mine.**—Locality, six miles east of Sierra Buttes. Veinstone, quartz. Power, twenty feet. Strike, easterly and westerly.

Metals—auriferous, yellow sulphuret copper, blue and green carbonate—black oxyd.

Assay from twenty-seven to fifty per cent. copper. Sulphuret of molybdenum, molybdic ochre. A dark bluish antimonial ore, containing by assay \$147 gold per ton. Formation, feldspathic granite.

GROUP No. 3.—Linear extent, considerable. **Primrose Gold and Silver Mines.**—Locality, Hog Cañon, twelve miles east from Downieville. Veinstone, quartz. Power, twenty feet—compact, crystallized, saccharoidal and often finely laminated. Strike, northerly and southerly.

Metals—argentiferous and auriferous galena. Zinc blende, copper, iron, antimony and arsenic—yields by assay from \$50 to \$400 silver; \$10 to \$100 in gold. Will work from fifteen to thirty dollars in free gold per ton.

Formation, metamorphic slate—a limestone belt in near proximity.

GROUP No. 4.—A small area. **Gold Valley Mine.**—Locality of Gold Valley, ten miles east of Downieville. Veinstone, quartz. Strike, easterly and westerly. Power, from four to twelve feet. Texture, compact.

Metals—massive iron pyrites, galena, blende, copper, and foliated tellurium. Concentrated sulphurets, which assay from \$50 to \$225 per ton.

Formation, highly metamorphosed slate.

GROUP No. 5.—Linear extent, inconsiderable. **Kanaka Mine.**—Locality, Kanaka Ravine, six miles east of Downieville. Veinstone, drusy quartz. Strike, northerly and southerly. Power, from eight to forty feet.

Metals—auriferous, galena, blende and copper, arsenical pyrites of iron—the latter not auriferous; arsenical manganese, which replaces other ores in depth, and is slightly auriferous.

Formation, feldspathic and silicious slates. A heavy belt of limestone lying to the eastward.

GROUP No. 6.—Extensive area.

Union Mine.—Locality, Wet Ravine, seven miles southerly from Downieville. Veinstone, laminated quartz. Power, from two to four feet.

Metals—auriferous iron pyrites and a little galena and blende, occasionally, very rich pockets of free gold.

Formation, greenstone trap. Both ores, gangue and country rock are identical with those of some of the Grass Valley mines.

GROUP No. 7.—Extensive area, and including or adjoining group No. 6.

Oak Flat.—Locality, Kanaka Creek, eight miles south of Downieville. Veinstone, quartz and fluor spar. Power, from two to five feet.

Metals—auriferous iron, and arsenical pyrites, galena and blende.

Formation, serpentine and talcose slate, resembling some of the Grass Valley ores.

GROUP No. 8.—Extent unknown, probably extensive.

Mammoth or Page Vein.—Locality, Sailor Ravine, two miles north of Downieville. Veinstone, drusy quartz. Power, from three to five feet. Strike, northerly and southerly.

Metals—arsenical pyrites (mispickel) very rich in gold.

Formation, serpentine, adjoining a highly metalliferous trapish slate.

GROUP No. 9.—Extent unknown.

Sailor Lodge.—Locality, Downieville. Veinstone, laminated quartz. Power, from eight to twelve inches.

Ores, galena and copper in small quantities. Gold, free and vein very rich.

Formation, between clay and serpentine.

GROUP No. 10.—Narrow belt, linear extent considerable.

Shug Canon.—Locality, one mile south of Downieville. Veinstone, quartz, drusy, laminated and saccharoidal. Strike, northerly and southerly.

Metals—free gold, a very rich class of iron pyrites, assaying from \$500 to \$1,800 per ton. Free gold by working test, from twenty-five to thirty dollars per ton.

GROUP No. 11.—Extensive beds, linear extent considerable.

San Saba Iron Mines.—Locality, head of Middle Fork of the South Yuba, about fourteen miles from Downieville.

Formation and metals, chloritic slate and carbonate of lime, in which occur immense beds of a very rich class of magnetic and spathic iron ores, assaying from sixty to seventy per cent.

As we previously stated, the above enumerated lodes are the representative mines of their respective groups. In addition, we will enumerate noticeable specimens from other veins included in the above groups. The cabinet being incomplete, as

yet, the county is not fairly represented, but as fast as classified and arranged we will make note of them:

Gypsum ("Selenite"), from Wolf Creek. Concretion of hydrated oxyd of iron, from Group No. 1. Very rich in gold from talcose slate. At Sierra Buttes, from a pocket, \$20,000 was extracted.

Gold-bearing quartz from Group No. 10. From Gold Bluff, laminated saccharoidal.

Gold-bearing quartz from Group No. 6. From American Hill mine, massive auriferous pyrites, and thin gold laminated on talc.

Gold-bearing quartz from Group No. 1. From Four Hill mine, rich auriferous, pyritous ore, galena, tellurium and blende. Texture, gangue, saccharoidal, and laminated.

Gold-bearing quartz from Group No. 6. From French mine, at Wolf Creek. Gold in thin laminae on dark talcose slate covering quartz.

Gold-bearing quartz from Mexican Mine, Group No. 10. Very rich massive pyritous ore—assay, \$800 per ton.

Gold-bearing quartz. From Von Humboldt mine—a recent discovery, not grouped—occurring in feldspathic granite resembling the ores of Group No. 2. The ores rich in free gold.

Gold-bearing quartz. From Chip's mine, Group No. 2. Free gold and copper pyrites.

Titanic iron. Containing nickel from South Fork.

Carbonized and opalized wood. Petrifications from bed of ancient river channel, known as the Blue Lead.

Fossils of a variety of fresh water shells. Petrified mushroom, very perfect, from bed of ancient river.

Petrified seeds, resembling the melon seed.

Concretions of a variety of forms from ancient river channel, near Brandy City. One in particular, which we noticed, appears to have been a lost jewel or emblem belonging to the ancient and honorable order of E. C. V. [Pre-Adamite, no doubt.] Argonite—a beautiful specimen.

Hornblende crystals, black prismatic in quartz. Olivine.

Asbestos.

Crystallized Quartz—a variety.

Manganese—black oxyd. Very pure.

Photographic rock. Petrifications and fossil ferns and mosses.

Crystals of magnesia.

Messrs. C. & C. propose devoting a portion of their cabinet to other mining counties, and have quite a collection of representative ores from Grass Valley, Summit City, etc., etc. They propose making exchanges with any party forming cabinets of minerals who have duplicates for exchange.

Address, **DEWEY & Co.,** Mining and Scientific Press Office, San Francisco. 1413-lamf

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 17th, 1866.

Since our last reference there has been rather more activity in the demand for money in certain quarters, but a steady accumulation for a month past in the vaults of the Banks has imparted more ease to the general market, and accommodations are now obtained without much difficulty at 1 1/2 to 1 3/4 per cent. per month. The buoyancy of the mining share market has attracted some attention this week, and if the recent advance in a number of stocks continues to be well maintained, this description of collateral will soon obtain more favor with capitalists and others. For a long time it has been exceedingly difficult to negotiate loans based upon mining shares, even at a very wide margin from current market values, but within the past few days some important loans have been effected upon these securities at comparatively low rates of interest.

In our issue of October 13th, we gave a tabular statement of the Bullion receipts for three months of eight companies working on the Comstock lode. To-day we present it in a thoroughly revised form with the addition of the Confidence and Ophir companies, and with the receipts of October appended:

NAME.	July.	August.	September.	October.	Total.
Yellow Jacket..	\$231,706 00	\$379,699 92	\$292,500 78	\$180,283 67	\$1,184,290 37
Savage.....	140,000 00	145,000 00	145,000 00	210,000 00	640,000 00
Hale & Norcross..	135,073 00	119,417 38	153,000 64	132,303 74	539,800 76
Gould & Curry..	125,000 00	131,395 23	117,821 35	114,321 61	488,538 29
Crown Point..	36,557 00	80,451 10	120,000 00	110,000 00	347,008 10
Imperial.....	65,408 10	75,840 52	78,450 87	98,380 00	318,089 55
Chollar-Potosi..	72,000 00	67,000 00	53,000 00	60,000 00	252,000 00
Confidence.....	40,398 74	20,096 58	37,059 56	41,563 72	139,118 60
Emp. M. & M. Co.	28,440 70	31,520 25	41,813 15	42,000 00	143,774 10
Ophir.....	19,582 60	27,684 50	20,681 23	22,580 24	90,538 62
Totals.....	\$939,904 26	\$1,090,735 54	\$1,060,070 66	\$1,031,501 04	\$4,122,211 40

The Mining Share Market continues to gather strength, and some leading stocks have been sold during the past week at greatly improved prices. The list of dividend-paying mines is increasing and a general improvement is noticeable; still there are claims that have latterly been a burden to stockholders, while some have not paid dividends for many months past, but the majority of this class are now reaching a degree of productiveness that pays expenses and provides the means of future developments. With scarce an exception the Washoe claims now in the market are doing very well, and many are challenging public favor with new evidences of value. In addition to the mining company dividends announced in our last week mention that of Crown Point, Hale & Norcross, and Imperial, making the total cash disbursements of this nature to stockholders for the month of October \$229,200.

Chollar-Potosi opened at \$185, receded to \$159, steadily advanced to \$202 1/2, and closed yesterday at \$225. We learn that favorable results have been obtained by this company in the first station drift of the new shaft. The cross-cut on this level is about 200 feet north of the turn-table, and the developments at a distance of 20 feet exhibit a deposit of fine ore about six feet in width. This is an entirely new body of ore, it appears, and by later information than the 11th inst. is said to be improving as work progresses. Average assays made from ore taken from all parts of the drift give a yield of \$107 and \$133 to the ton, while selected ores produced \$392 and \$900 to the ton. The 700-foot station in the new shaft, it is said, will soon be reached, which is 866 feet from the line on the Gould & Curry croppings. During the week ending the 11th inst., 553 1/2 tons of ore were sent to Custom mills.

Ophir was in more than usual demand the past week, selling at \$82 1/2 seller 3, dropping to \$71 and \$70 rallying to \$85 seller 30, and closing at \$190. This company is at present vigorously at work in stopping from the 7th level toward the Walsh shaft, and they are now about 60 feet east from that point. By this means they are endeavoring to reach the rich deposit of ore under the base metal discovered at that place in going down in the Walsh shaft, but which

had to be abandoned at the time on account of the presence of a large body of water. Assessment of \$72 per foot delinquent on the 19th.

Crown Point was dealt in to a very limited extent during the past week, selling at a recession from last quotations—\$880 and \$850, then dropped to \$800, closing at \$940, ex-dividend. Considerable ore, it is said, is still being taken from above the 300-foot level. In going north from the main drift on the 400-foot level the ore is said to have considerably improved. The middle incline was within about three feet, on the 10th inst., of the 400-foot level, and still in good ore. The mine produced 658 tons of ore during the week ending November 10th. This company paid a dividend of \$50 per foot on the 15th.

Savage ranged from \$1,450 to \$1,490 buyer 30, early in the week, then advanced to \$1,540, suddenly improved to \$1,710 and \$1,750 buyer 30, and closed yesterday at \$1,660. The yield of ore during the week ending November 10th, amounted to 1,469 tons, valued at \$65,659, and deducting the expenses of extraction and reduction, leaves an estimated balance of \$36,735; the average yield is \$14 70 per ton. This amount of ore was taken from the following points of the mine: 6th station, 826 tons; 7th station, 66 tons; upper level, 152 tons; and from the Curtis shaft 425 tons. The winze from the 6th to the 7th level, at a depth of 70 feet, continues in good ore, and the drift on the 7th to connect with it, it is said, also produces fine ore. From this fact the reasonable deduction is made that a large body of ore extends through the entire 100 feet intervening between the 6th and 7th levels. In the Curtis shaft the north drift is vigorously pushed forward in order to reach the old works as soon as possible. It passes through a variable quality of ore.

Gould & Curry realized \$400 per foot during the week, and at the close, sold at \$500. Nothing of importance concerning this company. We notice that Mr. David Bowie, formerly secretary at the company's reduction works in Virginia City, has assumed the secretaryship of the company in this city, made vacant by the resignation of Mr. J. M. Shotwell.

Yellow Jacket opened at \$690, then rapidly improved to \$720 and \$752.50, then sold at an advance of \$175—\$930, and closed at \$935—ex-dividend. We can gain no authentic information relative to the rapid appreciation of this stock. Since the first of this month no reports have reached the office in this city. It is rumored that rich developments have been made in the lower level from the south shaft.

Hale & Norcross remains in firm hands, and no sales transpired in the Board the past week. We quote the stock nominally at \$1,800 bid per foot. The ore delivered to the reduction mills, to the 11th inclusive, amounted to 1,230 tons, 65 per cent. of the assay value aggregating \$69,473. A dividend of \$100 per foot, was paid on the 15th, out of the earnings for October.

Imperial opened at \$109, gradually improved to \$120, then advanced to \$127, receded to \$120, and closed at \$122. This company paid a dividend of \$8 per share on the 15th inst. The first cleanup for November amounted to \$16,000 and upwards. The Imperial-Empire shaft had on the 10th attained a depth of 675 feet. The winter supply of ore, it is said, has been largely augmented since our last report.

Confidence improved from \$55 to \$58 1/2, and at the close \$60 is asked. We learn that the aggregate yield of this mine for the fiscal year ending October 31st, was \$285,680.68. Our readers are referred to the table appearing in this number regarding the yield of this company for the past four months.

Empire Mill sold at \$112.50, advanced to \$120, and \$130 was bid yesterday. ... Belcher jumped from \$62.50, seller 30, to 110, closing at \$130, buyer 30—assessment of \$33 per share delinquent to-day. ... Overman sold to a large extent within a range of \$13 1/2 to \$22, closing at \$31 1/2. ... Bullion opened at \$19, then sold at \$13.50, and closed yesterday at \$17.50.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$446,550.50.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the *Miner* of Nov. 10th: The Washington mill, at Davidson's, is only waiting the arrival of the balance of the machinery to get into action. . . . During the week about twenty-five tons of black ore has been hauled from the Morning Star mine to the Washington mill. Two teams—four and six horse—are now constantly engaged hauling, and the ore vein is of such size that two men can take it out faster than it is taken away. . . . The contractor running the Tarshish tunnel is still making good headway, and expects to see the end of his first work—300 feet—before the new year.

From the *Silver Mountain Bulletin* of Nov. 10th: We learn that the engine and pump for the American Company, located at Monitor, has arrived at Sacramento, and that in a few weeks the steam whistle will afford music for our neighborhood.

Calaveras County—

From the *San Andreas Register*, November 10th: The Monitor and Merrimack works are progressing finely. They are taking out large quantities of rich pay-dirt. Both companies have erected large and substantial buildings over their shaft.

El Dorado County—

The *Alta* has the following telegram: Placerville, Nov. 12th—11 A. M.—The Woodside quartz mine, located at Georgetown, struck the richest quartz on Saturday last, that was ever seen in California. It is estimated by competent judges that over \$50,000 were taken out on Saturday and Sunday. They are now hocking out nearly a pure solid mass of gold three feet in length. This is no humbug, as my informants have seen and handled the chunks, one alone weighing over one hundred pounds. The shaft is one hundred and ten feet deep where the gold was struck.

Kern County—

From the *Havilah Courier*, Nov. 10th: The Joe Walker mine has within the past ten days yielded to its fortunate owners twelve thousand dollars in gold. From the extent of this lode already developed, it is safe to estimate that it will yield at least one thousand dollars per day for years to come.

Nevada County—

From the *Grass Valley National*, November 9th: The American Company, at Manzanita Hill, San Juan, have a claim with a front of about five hundred feet; their sluices are from three-fourths of a mile to a mile in length, at the end of which are three pans, which grind up the coarse gravel. Connected with the end of the sluices is a strainer which saves the said gravel. This company have lately put up an 8-stamp mill. The Yuba Tunnel Company have their tunnel in about one thousand five hundred feet, and also a drift of two hundred feet. Their prospects are exceedingly flattering. From a handful of cement brought down from there the other day, some \$2 in coarse gold were taken.

The Diamond Ledge Company started up their works on Saturday last. They are down on the ledge about seventy-five feet, and they find the ledge to be about two feet in width. All the rock that has been taken out of the ledge so far has averaged about \$25 to the ton.

All the machinery for the 5-stamp mill for the Jim ledge is now on the ground, and will be shortly put up. This company have taken some fine rock out of their mine, and the ledge continues to look remarkably well.

From the *Union*: The claim of the Cincinnati Company contains 2,600 feet, and a drain tunnel has been run a distance of two hundred feet. The ledge has lately been leased to Uncle Billy Chollar, John Bennett and others, who are taking out quartz that it is thought will average \$40 a ton.

From the *Gazette*, Nov. 14th: We learn that gold in considerable quantities has been discovered in a conglomerate formation on the line of the railroad, at a point above Alta. While making a cut on the grade through the conglomerate, some of the rock that had been thrown out by blasts was pounded in a mortar, and on being washed down was found to contain free gold. This led to further prospecting which has pretty well established the fact that the rock will pay for working by mill process. The formation extends for a considerable distance on both sides of the railroad line, and numerous claims have been located. The railroad company will hold two hundred feet on each side of the road, but beyond that miners can locate claims. The discovery, it appears, was made some weeks ago. It is probable that the gold was originally contained in the quartz pebbles.

EXCELSIOR.—The Confidence, Pacific ledge, has been explored to a depth of 66 feet, and

shows an average width of nine feet, with foot and hanging walls well defined. Around the shaft there are between 800 and 1,000 tons of pay ore, which will be worked at the Winton mill. It is the intention of the company to erect over their shaft a substantial building, and continue at work, without cessation, through the winter.

Twenty-eight tons of rock from the Mohawk and Montreal were recently worked at the Metallurgical Works, and yielded, by the chlorination process, \$677.40. Twenty tons were from the bottom of the shaft on the second level, and fairly represents the average of the ore at a depth of 240 feet from the apex of the ledge. The remainder of the rock was taken from near the surface, and contained a large proportion of free gold.

The Gold Run Phoenix Company has erected a substantial house at the mouth of their tunnel. . . . The California Co. has a building 40 by 25 feet, over its shaft near the Knickerbocker ledge, and is well prepared to prosecute all needful work during the winter.

Placer County—

From the *Stars and Stripes* of Nov. 7th: The Union Mill Co. are now opening two ledges—the Elizabeth and Croton Hill. We were shown some of the rock from the Elizabeth at a depth of 35 feet, which shows well in sulphurets and free gold. The ledge is about ten inches wide, and works \$35 per ton. It is in slate casings, and easily got at. A shaft is now down 75 feet on the Croton Hill, and the lead is a paying one. The company propose erecting a new mill in a short time.

Work is being vigorously driven ahead on the suffrage lead. The shaft is down 50 feet, and the present contract will carry it down 20 feet further. The rock is full of sulphurets, and also shows free gold and galena.

Plumas County—

Greenville correspondence of the *Plumas National* of November 10th, has the following: The mines in this section as a general thing, are doing very well. Some few however, have suspended work for a season; amongst these are the Pennsylvania, Union, and Summit. Bidwell & Co. are taking some very fine rock out of the Caledonia. They are also crushing from the Bullion, and from the size of the lump of amalgam which I saw in their store the other day—one week's run—would say they had a good thing.

From the *Quincy Union* of November 3d: There is some excitement in regard to the new diggings in Bear Gulch, near Willow Valley.

. . . The Crescent Company are at work taking out some very rich rock from their claims in Indian Valley. It is expected they will make one of the largest clean-ups this week ever made by the company. In the tunnels where they are now at work, the walls and quartz actually sparkle with gold when the light is near. . . . Fred King, of Mohawk Valley, started below in the stage on Tuesday last. He took with him about 100 ounces of bullion, which was taken out of his four-stamp mill at Mohawk Valley at the last clean-up. . . . One day last week Reed & Co. took out \$1,000 from their claims near Cariboo, on the North Fork. It was all coarse gold, varying in weight from 25 cents to \$50. . . . Messrs. Light & Bro. have purchased Mr. Davis' interest in the old Ward quartz claims at Genesee Valley, and intend putting up a mill in a short time. . . . Capt. Hersey recently sold his mining claims at Hungarian Hill to Aschheim Bros.

Taylorville correspondence of the *Marysville Appeal* has these items: Callahan is about to erect an 8-stamp mill on his claim. The tunnel tapping the lead is 400 feet in length. . . . On the Pennsylvania is erected a sixteen-stamp mill. This mine is paying a handsome profit on the capital expended in its development. . . . The Indian Valley Company have a good 20-stamp mill near their mine which is on the same great lead. . . . The Union is also a mine of considerable value. The company have two mills in operation—one of eight and the other of ten stamps. . . . A small outlay of capital would, I firmly believe, make Indian Valley one of the greatest gold-producing regions in the State.

Sacramento County—

From the *Folsom Telegraph*: In the Fisher claim, and also in the Poudexter claim they have a large face of the cement exposed and from which they expect to realize richly. Each company is working about eight men. It will take years to work out these claims. While at Fisher's claims, he washed about a handful of cement on a shovel, and got about twenty-five cents worth of coarse, rusty gold. Bruce B. Lee has several men now engaged in sinking shafts on the flat within the San Juan Grant line.

Shasta County—

From the *Courier* of November 10th: The Potosi mill, four stamps, cleaned up a four days' run last week, with a result of \$567.76, in free gold. The sulphurets saved from the run will nearly equal in value the amount in free gold. Immediately above where they now

are, the original owners took from near the surface rock that averaged over \$800 per ton in free gold. The hopes of the company run high now because of this prospect.

Accounts from the South Fork district continue to be most flattering. The Big Central shaft is down 60 feet, and at that depth shows a ledge 10 feet, and pays \$40 per ton by working test. . . . The Chicago, at the bottom of the shaft, shows a ledge five feet wide, that prospects better at the bottom than at any intervening point. Other lodes are being opened, and the same astonishing richness is developed in all. . . . We are advised that Mr. Petty, a large claim-holder in the South Fork district, has sold his claim of 300 feet in the Original Crystal, for \$2,000, to a gentleman from Grass Valley, a practical miner and millman. The same gentleman has made other purchases and engagements in the district, which fully justifies the assertion that at least one practical man, with money, has confidence in the district. . . . The Washington mill cleaned up last week, after a month's run. Result: \$1,583.23 after melting. Only five stamps were used in this run. . . . A clean up of four days' run by the Mammoth mill shows a result of \$649.98—the rock averaging about \$18 per ton. The prospects in the ledge are very flattering.

Sierra County—

From the *Downville Messenger* of Nov. 10th: A friend from Eureka informs us that the hoys are getting ready to work as soon as the water comes, which will not be long if this weather continues. The Chaparral Hill Company are enabled to work several hours a day, and are making wages. . . . A ledge of gold bearing quartz was recently discovered about one mile above town, on the South Fork, which prospects finely. R. C. Sternberg traced the ledge across the river and took up an extension, the rock from which prospects equally well with the original.

In our notice of the Page ledge in our last issue, the types made us say that it yielded \$3 or \$4 per pan, which was a blunder. As much as \$80 to the pan has been taken out. We also understand that from \$150 to \$300 have been taken out in a day. . . . An extension of the Page was sold recently for several thousand dollars to parties in town. It prospects finely.

In the Mammoth, the work of exploration progresses slowly owing to the stormy weather. Evidences of an extensive and very rich vein are abundant. About two tons of a very high grade of ore is sacked ready for shipping to San Francisco.

The Ackley mine, discovered this week, is situated about one mile from town, opposite Clements' mill on the South Fork of the Yuba. Where the gold is freed a very rich prospect can be obtained. An assay of its unoxidizing ores gave in gold, over \$3,000 per ton. Power, from eight to twelve feet.

Letter to same from Whisky Diggings, says: The different companies are taking out more than the usual quantity of gravel of more than usual prospects. Owing to the scarcity of water, there has been very little washing done since last spring; but each company has got out a pile of gravel, and now waits patiently for rain.

By permission we publish the result of several assays made by Crossman & Cochrane within a few days, from ores of the recently discovered lodes in this vicinity:

San Jo Bar.—Specimens of quartz containing iron pyrites: Gold, \$10.15. Silver \$1.80. Total per ton—\$12.05.

Good Hope Co.—Sample of quartz containing iron pyrites: Gold, \$650. Silver, \$7.20. Total per ton—\$657.25.

Paxton & Co.—Sample of indurate of talc containing iron pyrites: Gold, \$50.22. Silver, \$3.15. Total per ton—\$53.37.

Ackley & Co.—Sample of quartz and talc containing arsenical pyrites: Gold, \$3,074.96. Silver, \$39. Total per ton—\$3,113.96.

Redding & Co.—Sample of quartz containing iron pyrites: Gold, \$125.46. Silver, \$3.15. Total per ton—\$128.61.

Mexican Mine.—Sample of concentrated sulphurets: Gold, \$374.26. Silver, \$6.82. Total per ton—\$381.08.

American Hill.—Sample of quartz containing iron pyrites: Gold, \$75.24. Silver, \$4.73. Total per ton—\$79.97.

Washoe—

NEVADA.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Gold Hill News* of Nov. 8th: The Yellow Jacket Silver Mining Company, Gold Hill, to-day declared its regular monthly dividend of fifty dollars per share, payable on the 15th.

The Imperial Silver Mining Company have declared a dividend of \$8 per share, and the Hale & Norcross one of \$100 per foot. The Crown Point Gold and Silver Mining Company have also declared a dividend of \$50 per foot.

Reese River—

From the *Reveille* of Nov. 5th: There were

brought into town yesterday from the famous Murphy mine, in the Twin River district, over 5,000 ounces of crude bullion.

Same of 6th: We are informed by persons who have just returned from Twin River, that the magnificent mill of the Murphy Company works beautifully in all its parts, and is the admiration of all who have visited it. It is by all odds the finest mill in the eastern portion of the State. There are six pans and six settlers. The pans are of unusual size, both in diameter and depth, and receive nearly twenty-five hundred pounds at a charge, and it is claimed that a settler is essential for each. Besides the mill structure, there is an elegant and commodious office of two stories high, and other adjacent buildings, affording the most thorough facilities.

Same of 8th: A new mining district has been organized in the southeastern portion of the State. It is about twenty-five miles south of Hot Creek, and adjoins the Empire district. It is called the "Milk Spring" district. Wood and water are abundant. Captain S. Baker and party discovered and located some five ledges, varying from five feet to twenty feet in width, and although spotted on the surface, they exhibit remarkably rich mineral. From present indications it promises to rank with the Reveille and other noted districts lying southeast of Austin.

Two tons of ore were brought in to-day from the Danville district, and were taken to the Keystone mill for reduction. The ore was obtained from the Vanderbilt ledge, which is regarded as the most promising in the district, and is of a superior quality.

Same of 9th: We were shown yesterday by William Parry, a small bar of bullion procured from ore of the Victorine ledge at Blunker Hill, which was of a high grade. It contained a large amount of gold, being worth \$6.50 per ounce. The ore was reduced at the mill of the New England and Nevada Company, at Kingston, and the gold was amalgamated in the battery.

We learn that the Consolidated Silver Mining Company are erecting a 10-stamp mill, with a 30-horse power engine, at Hot Creek, where they own important mines. The machinery passed through town yesterday on the route from Sacramento City to the district. The General Agent of the company, Mr. T. F. Gould, is sanguine of having the mill completed and running by the first of January. The company has five engines and ten boilers, with all the necessary machinery, at Sacramento, and it is in contemplation to erect shortly at certain points two mills, each capable of reducing twenty tons of ore daily.

The Reveille district bids fair to prove the very richest yet discovered in this region. Mr. John Reed has just sent to our office a small parcel of nearly pure silver, which he obtained from one-fourth of a pound of ore from the Fisherman ledge. The ore was burned in a blacksmith's fire, and yielded over thirty cents of silver.

From the *Nye County News* of Nov. 3d: Messrs. Gillette and O. T. Clark, laid upon our table yesterday some very fine ore, obtained from Hot Creek district. They report the discovery of several very fine ledges, and the ore shown us will bear them out in their report. They think the Hot Creek country the richest yet discovered, and report many ledges of immense size and richness. A 10-stamp mill has been removed from Austin to Hot Creek, and the prospect is good for another mill in the district before long.

A gentleman just from San Antonio reports business as tolerably brisk in that district. Courter and Rigby have a large force at work upon their mines, which are being developed with the aid of an abundance of Eastern capital. They have on the ground the machinery for a 4-stamp mill, intended for prospecting purposes. An agent from New York had just arrived at San Antonio, with a gang of men to work upon the Liberty mine, which will be thoroughly developed during the winter.

Esmeralda—

A letter from Wilsonville to the *Mariposa Gazette* of Nov. 10th, has the following: "We are now opening one of the richest mines the world ever saw, if we can judge from present appearances. It is one of those discovered by a Mr. Wilson, in July last, between East and West Walker river, some seven miles west of East Walker district. Mr. Wilson has out some seventy-five tons of rock, that according to the assay pays over five hundred dollars in fine gold. His ledge is fourteen feet thick and widening as it goes down. This ledge is called the Himalaya.

The Mastodon was the next discovery, located by the Wheeler brothers. Their shaft is nine feet square and fifteen feet deep, from which they have taken some fifteen tons of rock as good or better than Mr. Wilson's. The rock is richer at the bottom than on the top. This ledge is located for about one mile, the croppings from the whole of which are good. The next ledge discovered was the Grand Moonshine, which has been prospected about one mile, the croppings from which pay beyond all reasonable calculation. Besides these

ledges we have the General Grant, the Andrew Johnson, the Bridgeport, the Starlight and this Deposit No. 1, 2, 3, and 4. The rock from all these ledges is of the same richness. A Mr. Strutevant has purchased in the Hinalaya at \$100 per foot. There are three parties now negotiating for mills to erect here, and by the first of April intend to have them in operation."

IDAHO.

From the *Owyhee Avalanche*, Nov. 3d: The steam hoisting works recently used at the north shaft on the Poorman have been removed to the Surplus Oro Fino mine—their first location. It is expected that a contract will be let on the Surplus, and work soon commenced. Oro Fino presents quite a deserted appearance, and one that will probably never occur again after the opening of business next spring. . . . We made a call on the Woodstock ledge last week and found the owners at work in good earnest. Their discovery is down the mountain side, and they have thus far been expending their labor mostly upon building a road to the one leading to the Poorman. They now have it in a passable condition and are at work upon the mine, from which they expect to crush ore soon. While at the works we were shown some rock very rich in free gold and silver sulphurets. . . . Geo. S. Norris is now engaged in driving a tunnel on contract on the Hays and Ray ledge, which will strike it at a depth of one hundred and fifty feet below the surface at the South Poorman shaft. He has nearly four hundred feet to run yet. . . . The 4-stamp mill, at Silver City, known as the "Morse & Vass" mill, is being removed to Flint district. We believe Russ Carter and L. W. Greenwell have purchased it with the intention of working and thoroughly testing the Rising Star ledge. . . . Over nine hundred pounds of first-class Poorman ore was discovered in a cabin on War Eagle, by means of a search-warrant placed in the hands of the sheriff.

From the *Boise City Statesman*: John Justus, who has just returned from a general prospecting tour, states that a rich mining district has been discovered on the Salmon river, near old Fort Lemui, and distant from Walla Walla about 450 miles. The gold is represented to be fine, worth \$16 per ounce, and will require quicksilver to work to advantage. A large number of claims had already been taken up, and Mr. Justus anticipates that the New Salmon will become a flourishing mining district.

The *Idaho Times* of the 26th inst., says several of our citizens are about to act on our suggestion of sinking a shaft, and taking a peep under our surface bedrock. We are glad to see it. We will take a little stock, for we are confident that future developments will show that we know but little of the wealth of Boise Basin.

The *Avalanche* has an editorial in which the difficulty of inducing capitalists to invest in the mines of the Owyhee district is attributed to the fear of expensive litigation. The same game that has been so often played in California, is tried there; and an appeal is made to all classes to frown upon such tricks, as being ruinous alike to all interests.

ARIZONA.

From the *La Paz Gazette* of Oct. 25th: The Big Bug mill is entitled to the credit of having turned out Arizona's first gold bricks. The mill is on Big Bug creek, about fourteen miles northeast of Prescott, and was erected by Chas. Berger & Co. It is a 10-stamp mill. . . . The Woodsey mill has been running for some time, with encouraging results. It is of five stamps, and is on the Agua Fria, about twenty-one miles from Prescott. . . . The Johnson & Groom mill is nearly ready for running. It has a four-stamp battery, with two Beath amalgamators. . . . The Vickroy mill will, it is expected, soon be put in operation. It is on the Bully Bueno lode, in Turkey Creek district, about thirty miles southeast of Prescott. It is owned by a Philadelphia company. . . . A. O. Noyes & Co. have on the way from San Francisco a 10-stamp mill, similar to Berger's, which will be put on the Umpqua mine, eight or ten miles from Prescott. . . . On the mine of the New York Moss Association, near Hardyville, Charles L. Strong, the superintendent, has put up extensive machinery, comprising a 40-horse power engine, and two 5-stamp batteries. . . . Mr. Ravenna is about making arrangements for the erection of a mill on his rich lead, the Conquest, near La Paz.

Tyson's mill, on Eureka rock, has got to work; it will yield well. A second Lamson Thunderbolt Crusher is about to be erected on the Ticonderoga. Rich rock has been struck on the Galsua. Woodsey's mill is steadily running, with an excellent yield.

On the 8th Nov., the schooner Isabel arrived from the Colorado river, bringing 3,514 sacks or about 210 tons copper ore. This is by far the largest shipment of copper ore ever made from that region. The ores generally found are carbonates of copper, which are easily worked, being reduced to commercial purity at one smelting.

COLORADO.

From the *Journal*, Oct. 23d: The old Henderson mill, twelve stamps, started up to-day under the management of Charley Aldrich. . . . We learn that the Smith & Parmelee Company are now running 100 stamps. . . . We saw last Monday in the hands of D. D. Belden, over 200 ounces of amalgam, the result of one week's run from a portion of the Black Hawk mill.

Editorial correspondence of same from Backskin, has the following: The Beaver Creek Mining Company have been at work here four years getting a bed rock ditch and flume in to the richer portion of the gulch. Their flume is 20 by 24 inches in size, three-fourths of a mile long, and its upper end, now within a yard and a half of the bedrock. The work is the most extensive of that description I have yet seen. There will be at least nine companies at work in "the Park" next season. The whole country for thirty miles pans out the color.

The Excelsior mine, belonging to the Colorado Company, of Philadelphia, crops out along the edge of a cliff a thousand feet above the town level. The vein is seventeen feet wide, quartz and dirt, and averages, without counting in a small but regular formation of silver of \$5,000 a ton richness, \$79 a ton. Very rich copper ore is coming in at 130 feet depth—17 per cent. There are a thousand tons of quartz and dirt in crib now, and 2,000 mors thrown down in the mine, ready to be raised. About 400 feet below the outcroppings of the lode, a tunnel has been started in, and from that it is expected to work this mine after this year. A part of the machinery of this mill will be started this month.

Below Hamilton, on Faryall creek, two or three companies have been mining by ground sluicing and hydraulics. One of them has worked into the creek bank 400 feet, it paying better this further he goes, and last week his return was \$23 to the hand per twenty-four hours. He has worked out about an acre. The soil is about twelve feet thick, and is a hard, dry gravel, very hard, but easily knocked down and dissolved in water. We shall see, very soon, in the South Park, some of the largest and most remarkable placer mining operations ever seen anywhere.

From the *Denver News*, Oct. 24th: The Nonpareil Prospecting and Mining Company have suspended operations for the winter. The company's prospector, Mr. Joe. T. Boyd, arrived in Denver on Saturday. He has secured some very fine property for the company in the Snake River district. . . . The C. P. & M. Company have discontinued for the winter the work in their mines, over the range, and will turn their attention to the development of mining property in Ward district until next season. . . . A tunnel is now being run on the Eureka lode in Snake River district. The lode is the property of the Colorado and St. Louis Company. At the depth of eight feet, the crevice shows four feet wide. The rock assays \$384 per ton.

Editorial correspondence of same: Along Clear Creek, below Idaho, some mining is being done in the bars. Our sluice is paying twenty-five dollars a day to the hand. Some new bar claims are being opened. . . . At Spanish Bar, the Lombard Company is pushing its works; both building and mining. At Mill City, Mr. Hawkins is pushing work on his company's tunnel and mines with encouraging prospects. . . . In Georgetown and Elizabethtown, four smelting furnaces for silver ores have already been built, and another is under contract to be finished this fall. One of these is the property of Jos. Watson, and was expected to start up to-day on very rich ore from the Baker lead. The furnace of Herrick & Co. is the most extensive and the most expensive of all. It will be completed in about two months.

At Argentine things look dull, most of the cabins have the appearance of being closed for the winter. Work is still going on in one or two mines. The Paymaster is being worked energetically by Messrs. Stowell & Bennett, who carry their ore down to Elizabethtown. In Fern district considerable work is still being done, though quite a number of prospectors have left. Probably not less than seventy-five leads have been sunk upon this season from ten to twenty feet. A few men will winter here with the intention of continuing work upon a few leads.

Mr. F. N. Bogue, of Idaho, informs us that Dr. Holland, of Trail Creek, Clear Creek county, is running a stamp mill for custom work. The mill is doing a good business for the different miners, and all are well pleased with its operations. . . . The Whale mill, the largest in the Territory, is now running. The South Clear Creek Gold and Silver Mining Company are working on Spanish Bar with good returns. Considerable mining is also being done on the bars below Idaho. Mr. Bogue is of the opinion that, from the work now being prosecuted, there will be more money taken out of Clear Creek this month than there has been for the past three years.

Letter from Hamilton, says in regard to the

mines in that neighborhood: One bank claim, working three men, has yielded regularly over a pound of gold per week. Another has given fifteen dollars per day to the man. Still another—which averaged a less amount for the season—yielded twenty-five dollars per day to the man towards its close.

MONTANA.

From the *Post*, Oct. 27th: We saw Mr. Moore, the Recorder of Brown's Gulch, yesterday. He showed a fine nugget that was taken from claim No. 9. Eight flumes are being worked with successful results, but many owners are waiting for the next spring. The depth to the bedrock varies from six to twelve feet, and water is abundant. The discovery is near the rich "True Flag" lead. One claim paid \$70 per hand during the last week, and Mr. Moore states that he has seen six dollars taken from one pan of gravel. About sixty miners are laboring at different points in the gulch. . . . In Rochester gulch, the gravel has yielded forty cents, and \$1.50 to the pan, and all speak in high terms regarding its wealth. This water will be brought from Camp creek, and a ditch has been commenced, which will be finished this winter.

Helena item: The miners in the upper part of Dry Gulch have been prevented from working by the snow and bad weather of the past week. They have no intention, however, of abandoning their claims for this season yet. In this part of the gulch the miners are taking out good pay, and are not compelled to lie idle for want of water, as is the case with those owning claims further down and nearer the city.

From the *Nevada (Cal.) Gazette*: We had a conversation yesterday with Mr. Humphrey, who left here last spring for Montana, and returned a few days ago. He gives a more favorable report of the prospects of that country than we have generally had from other sources. He says the mines are rich and shallow, and easily worked where water can be had; but as yet there are few ditches, although the country is much more favorable for constructing ditches than California. Humphrey is interested in a ditch, which is now completed, and is sixteen miles in length.

OREGON.

From the *Times* of Nov. 12th: Mr. Foster of Umatilla, called on us last evening, and gave us the cheering information that hill diggings were discovered last Friday within a mile and a half of Umatilla City—up the Umatilla river—which prospect from five to ten cents to the pan. The gold is very fine, but no difficulty is experienced in saving it. Claimants were already putting in sluices when Mr. Foster left, and he thinks it safe to say that not less than a dozen will be in full operation before the close of this week. Water in abundance can be used from the Umatilla river without great expense. The locality where these new mines are found has been traveled over for years without discovery or suspicion of their existence.

BRITISH COLUMBIA.

From correspondence of the *Montana Post*, Oct. 27th: The excitement of Salmon and Green rivers still find customers, and in spite of the cold weather and snow-storms just now raging, many are bound thither—some with wagons, some on horse-back, with pack-animals, and less fortunate ones ride on foot. Considerable calculating and figuring is made upon diggings located about 650 miles north of Helena, on the Suchaneau river, in the British possessions. No doubt quite a rush to that section will be the result of a long winter's consolation upon the reported mines.

A gentleman who left the Kootenai mines on Nov. 1st, gives the following items: The weather was fine and no snow had fallen. About sixty white men and three hundred Chinamen will winter at Fisherville. One hundred and eighty Chinamen were reported on their way to the mines from the Columbia river. The diggings average about wages.

STEWART'S EARTHQUAKE REGISTER.—The San Jose *Mercury* of November 8th, says: "During the past seven months the Register, invented by W. F. Stewart of this city, has noted nine distinct shocks or oscillations of the earth's surface. The direction of the oscillations have all been N. E. and S. W. The Register marked seven of these shocks with single straight lines indicating an electrical shock in one direction. Two of the shocks were curvilinear or spiral upon the disk."

EXPLOSION OF YEAST.—A keg of yeast recently exploded in an express office in Freeport, Ill., hurling a forty-pound bar of iron lying upon it through the ceiling above into a crate of crockery, to the detriment of earthen ware. The express agent, who was standing near, was violently thrown over a pile of boxes and considerably injured.

Metallurgy.

To Copper Miners and Others Interested in the Working of Copper Ores.

THE UNDERSIGNED HAVING BEEN APPOINTED Agent and Attorney for N. Haskell, for the sale of his COPPER SALTING PATENT, which has proved a perfect success, is prepared to furnish the same to parties having Copper Ore, or will make arrangements to lay their Ore, receivable at their mines. For further particulars, apply to
JOHN S. RISBOS,
21v12 At Coffey & Risdon's, San Francisco.

MARTIN & CO.,
Office, Stevenson House,
Corner California and Montgomery streets (up stairs).
WILL CONTRACT FOR THE
PURCHASE OF COPPER ORES.
Assaying eight percent, and upwards of Copper to the ton. We will make advances upon Ores of Copper.
San Francisco, Post Office Box 1259. 22

EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.
The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.
S. F. KIMBALL, J. R. MURPHY.

JOHN TAYLOR & CO.
IMPORTERS,
AND DEALERS IN
ASSAYERS' MATERIALS,
Druggists' & Chemists' Glassware,
Photographic Stock, Etc.
512 and 514 Washington Street,
SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior
ASSAY AND BULLION BALANCES,
And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, ETC. We have given this branch of our business particular attention, to select such articles as are necessary for the development of the mineral wealth of this coast. A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUPPLIES, ACIDS and CHEMICALS, constantly on hand.
San Francisco March 6, 1855. 11v10-11

Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of all other ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 11v13-14

GEORGE H. POWERS, M. D.,
Gives exclusive attention to
Diseases of the Eye.
No. 626 California street, between Dupont and Kearny.

Dr. Powers refers, by permission, to Rev. A. L. Stone, D.D., Ira P. Rankin, Esq., L. B. Benchley, Esq. 17v13-6m

For Sale—Cheap.
A GOOD PAYING BUSINESS, TOGETHER WITH THE good will of the party controlling the entire trade of this city and State. It is suitable to any intelligent business man, and has averaged about \$500 per month. It is now offered low, solely because the proprietor is compelled to leave the city. Address "S. H. Lock Box 62 Post Office, or inquire at S. W. HOWLAND'S, No. 24 California street, San Francisco. 17v13-14m

PATENT BUSINESS.
We have lately associated with us in the Patent and Mechanical Department of the MINING AND SCIENTIFIC PRESS, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

San Francisco:

Saturday Morning, Nov. 17, 1866.

NOTICES TO CORRESPONDENTS.

OWING to the large amount of correspondence received relating to interesting points connected with Mining, Metallurgy, Mechanics, etc. we are compelled, for want of time and space, to reply briefly in the following form to a portion of such queries as are of general interest.

S. M., MAGNETISM.—The tendency of opinion amongst scientific men has of late more and more pointed to the establishment of the view that what is termed electricity, magnetism, heat, light, etc., are correlative—that is, having a reciprocal dependence on each other, the varied display being made through the medium of motion. The celebrated Lord Bacon inferred, from a large number of facts, that heat is essentially motion. Faraday made some experiments which went strongly to establish the principle that the particular force discovered and named by Newton, and ever since denominated gravitation, is probably only an allotrope (changed condition) of the same mysterious agency. Notwithstanding the great ability and immense research displayed by recent writers on "The correlation of forces," we are strongly inclined to think that some very simple and well known facts go far, unless fully explained, to negative much of their powerful reasoning, and invalidate what might otherwise be accepted as brilliant demonstrations. We may take the well known property of the magnet itself, either artificial or natural, of suspending a piece of iron for an unlimited time, or attracting, under fitting conditions, a limitless series of pieces, by which force must necessarily be expended in each instance, notwithstanding which the attracting magnet will not lose a particle of its weight; nor will its magnetic property be in the slightest degree impaired. Miners could add much to the facts already known respecting this mysterious agent, by making a series of observations in their mines. In order to be of the utmost service, such observations should be kept in a regular register, inserting not only a variation of the needle, but a column should be added for the temperature noted at the time of each magnetic observation; a wide column should also be left, in order to insert any remarkable perturbation—such as an earthquake, thunder-storm, etc., etc.

THE LOADSTONE is a natural magnet found in some places in enormous masses, and commonly known as magnetic iron ore, the magnetic properties usually being proportioned, as it is more or less composed of exact mixtures in atomic proportions of the protoxyd and peroxyd of iron. It has mistakenly been held even in many recent works on chemistry and mineralogy, (Miller's Chemistry, for instance), that the loadstone, or magnetic oxyd of iron, acquires its magnetism from the inductive influence of the earth. The following facts, however, completely disprove such an inference. If a piece of pure magnetic iron ore (loadstone) is dissolved in muriatic acid, a solution will be obtained consisting of a mixture of the proto and perchlorides of iron; if the acid is subsequently neutralized by an alkali (ammonia is to be preferred), the precipitated mixed oxyds will be found to possess precisely the same magnetic properties as the original loadstone. This solution, neutralization and precipitation, may be repeated a thousand or ten thousand times on the same material, invariably with the same result. As a still more crucial proof that the magnetic property of the loadstone is in no manner connected, or derived from any real or imaginary magnetic currents in the earth's crust, we may add that an artificial loadstone can be prepared from mixtures of the per and proto salts of iron, which are much more powerful in magnetic properties than any natural ores yet discovered.

BOOKS MISSING.—We offer a suitable reward for the return of the following valuable books, recently missed from this office: "Life and Travels of Alexander Von Humboldt," Vols. 1 and 2 of "Cosmos," several volumes "Annals of Scientific Discoveries," and "Popular Treatise on Gems."

ELECTRO(?) QUAKES vs. EARTHQUAKES.

The editor of the *Alta* has recently been pluming himself upon an asserted original discovery made by him, respecting those perturbations of the earth's surface, commonly, and, as we believe, more correctly denominated earthquakes, rather than "electro-quakes," as the sage of the *Alta* proposes that they shall hereafter be called. In order to prevent the slightest charge of misrepresentation, we insert his own statement, which appeared in that journal on the 3d instant:

Some months since a theory was advanced through the columns of the *Alta* which was decidedly novel—so much so, indeed, and so foreign to all previously accepted notions in regard to the cause of the shaking of the earth, as to excite much comment and no little incredulity; but for all that, the article was copied by a scientific paper in one of the older States, and endorsed. We now find, on receipt of our files of Parisian papers, that that which was supposed to have been a severe earthquake throughout France, was, according to the ideas of French savans, nothing more than what might be with consistency called what we first termed it, an Electro-quake. For instance, it is stated that, previous to the shock felt so distinctly at Paris, "The birds in the cages, at least ten seconds before the shock was felt, fluttered and hopped wildly about, and made the most determined efforts to escape." Again: "Owing to the peculiar state of the atmosphere, a paper with some chemical matter on it, which had been put out to dry previous to the shock, turned a color which was totally unexpected."

These and other interesting facts will uphold the *Alta* in the new theory put forth that, owing to the great amount of electricity in the atmosphere at times along the coast near San Francisco, we have these slight shocks, which continue from one year's end to the other, without the least cause for alarm.

Before proceeding with any comments on the above, we have to remark that he has failed to show what French savans endorse, as he asserts, this electro-theory. It is true the same number of the *Alta* which contains the paragraph quoted, has another headed "Particulars of the Earthquake in France," copied from the *Moniteur* of Sunday, the 16th of September last, in which the above and several additional phenomena are described. Fortunately for the character of the scientific (?) paper in one of the older States, which it is now asserted copied the original article from the *Alta*, and endorsed its views respecting electro-quakes, its name is not given; and perhaps the author of this so-called novel theory will continue to be reticent as to its title.

It will, perhaps, be somewhat annoying to the self-gratulatory spirit which pervades the prior part of the paragraph above quoted, as well as some that will be hereafter noticed, to learn that more than a century has elapsed since a similar theory was propounded by Dr. Stukely, whose memoirs on this subject were printed in the Transactions of the Royal Society, London, for 1749 and 1750. Dr. S. referred the phenomena of earthquakes to electrical action, supporting the conjecture (for it has never been accepted as anything more by those best acquainted with this and cognate subjects), by referring to the vast extent and mass of earth simultaneously shaken, and also from the prevalence of electrical phenomena attending earthquakes; several instances of which are given in the papers alluded to.

It will thus be seen, that so far from the theory of electro-quakes being novel, it has been propounded upwards of a century, and inserted in the oldest and highest scientific periodical in existence,—one accessible and well known to all men of scientific acquirements, and frequently referred to; yet, although a hundred and sixteen years have elapsed since the appearance of the papers under notice, and the fact that they were well known to all the numerous eminent electricians who have flourished since that period, including our eminent countryman Franklin, this theory has never been accepted or even obtained a footing amongst well informed electricians; on the contrary, Sir William Snow Harris, one of the first of living electricians, has observed, "That a high amount of electrical action attends these wonderful operations

of nature is quite certain; but in the present state of our knowledge of such phenomena, their reference to pure electrical action as a primary cause, must necessarily be considered to rest on a very hypothetical basis." Such are the modest conclusions of a truly scientific man; yet, if we were to put the question as to the originating cause of earthquakes to an ignorant humpkin, the chances are one hundred to one, if an opinion is elicited at all, that the reply will be electricity. In fact, we have heard this expressed a thousand times amongst the uninformed—and not unnaturally so; for the one class of phenomena must be about as mysterious as the other to the uneducated mind, whilst there are prominent characteristics connected with each which cannot in any manner, with ordinary minds, be so nearly paralleled by any other easily observed natural phenomena.

In another place the modern promulgator of the electro-quake observes:

We based this theory of electro-quakes originally upon purely scientific grounds. If earthquakes are caused, in all cases, by internal convulsions, the houses and structures on the surface of the earth can exhibit no motion but that which had been communicated to them. The most prolific imagination cannot conceive of a trouble in the interior of the earth that would give a rotary motion to anything on top of it.

Had the writer in the *Alta* been acquainted with dynamics, he would have known that where solid bodies have been rent horizontally, and portions twisted from their original position by earthquakes, as in the case of the Calabrian obelisks, and similar instances, that such a transposition of parts is not caused by any vortice motion of the earth, but arises from the center of gravity of the body so twisted or disarranged, lying on one side of a vertical plane in the line of shock, which passes through that point on the base on which such body rests, in which the whole adherence of the body to its support, by friction or cement, may be supposed to unite, which has not inappropriately been called the center of adhesion. The phenomena of twisted columnar structures is not confined to earthquakes; the same not uncommonly takes place when heavy and rapidly driven wheel carriages are brought into contact with such edifices. This phenomenon, together with the philosophy of the earthquake-wave, was more fully discussed and explained in our issues of October 21 and 28, and November 11, of last year.

There are several other erroneous opinions expressed in the articles noticed, to refute which, however, would require more space than can at present be devoted to them, or their importance deserves. We may, however, briefly allude to the disturbances sometime exhibited by the animal creation, either preceding or during earthquakes, occasionally to an extent, it has been asserted, sufficient to destroy life amongst birds and fishes; such mortal termination might, however, be occasioned by other means than that of electricity. This branch of the subject is one which, of itself, would form a long and interesting article; all that we have room at present to state with reference to this point is, that the effects alluded to as occurring to certain members of the animal kingdom have only been observed occasionally during earthquakes—in fact, form the exception, not the rule—nor would we have thought it necessary to refer to this matter, but for the strong desire which we felt to give our cotemporary the benefit of any matter which might be calculated, in the remotest degree, to support his position.

We are far from desirous of being understood as negating the occasional influence of the electric agent, whether called by the name of electricity, magnetism, or any other title, in inducing earthquake phenomena; in fact we would feel inclined to admit that it is difficult to conceive how an earthquake can occur without developing one or more of the forms of these mysterious influences; notwithstanding this admission, we are compelled to maintain that, even in such cases, the influence is indirect, and not the primary dynamic cause.

The most experienced seismologists* deem

*Derived from the Greek word for earthquake.

it established that no earthquake is simply "The transit through its crust and along its surface in any direction, from some point or points within the earth's interior, of a wave or waves of elastic compression, from vertically upwards to horizontally in any azimuth. That the originating force may emanate from any center, or from more than one. Such perturbations, according to circumstances, may be accompanied by sound and great aqueous; and occasionally aerial commotion. The former phenomena will be more or less apparent according to the amount of the initial force and its proximity to the observer. The latter will depend upon the relative position of sea and land contiguous to the center of the disturbing cause."

A careful and candid examination of facts connected with earthquakes, will satisfy any reasonable mind that the theory just quoted not only covers almost all the phenomena usually associated with earthquakes, but also that it is clearly explicable on known principles, and capable of all but mathematical demonstration, notwithstanding the existence of what, to the unlearned, appears to be glaring anomalies and paradoxes.

There are certain features connected with electricity which to us appear to render it improbable that it can be the originating cause of earthquakes. The first is the extraordinary speed by which it travels, amounting to 288,000 miles during a second, or, in round numbers, five hundred thousand times the speed at which the earthquake-wave travels—as the latter rarely exceeds the rate of thirty miles a minute. Our second reason arises from the very concentrated intensity in lines and points which appear to be required in order to produce any powerfully marked effects by electric influence, whilst on the other hand the results of earthquake energies are noticeable for the immense area over which the disturbing influences are sometimes spread, whilst the most intense and extensive electric storm ever known, will only splinter or destroy a few trees or prominent buildings—and these oftentimes miles apart, the bulk of the country being undisturbed.

PROCESS OF ROASTING ORES.—Under the above head, we this week commence the publication of a series of articles translated from the German of F. Plattner, by Prof. J. H. Tie-mann, M. E. a gentleman who has passed considerable time in Germany and other portions of Europe, investigating the various processes of mining and metallurgy, as there practiced and exhibited. These articles are translated originally for the New York *Mining and Gas Light Journal*, and will be reproduced in the columns of the MINING AND SCIENTIFIC PRESS, as fast as they appear in the *Journal*. We need not inform our scientific readers that the author of these papers, in the original German, was the ablest metallurgist of his age, and that his work from which these papers are translated, is the most complete and exhaustive of any work upon the subject of roasting ores which has ever been written; yet, strange to say, it has never yet appeared in the English language, although there is a French translation of it. Our mining readers will find an amount of information in these papers which will repay for their perusal, and which alone will be worth more than a year's subscription to the Press.

ACCIDENTAL INSURANCE.—This class of insurance has proved popular wherever introduced. It appears to be a lucky lottery, in which if you draw a prize your money is well invested, while if you draw a blank it is better than a prize. For a company of good reputation, we refer our readers to the advertisement of Messrs. A. D. Smith & Co.

PERSONAL.—Mr. John Wasson, of the Owyhee *Avalanche*, published at Silver City, Idaho, is now on a short visit to this city. He has contributed for our cabinet several valuable specimens from the Poorman and other ledges in that vicinity, which we shall describe next week.

THE "CUTTING BROMIDE PATENT."

The disposition to evade and over-ride patents, so often seen, deserves the censure of every honest man. For our own part, we favor the doctrine embraced in the phrase, "Live and let live." If a man is entitled to the fruit of the labor of his hands, he certainly is to that of his brains.

Probably all photographers in the United States, certainly all those who are in the habit of reading those journals which are devoted to their own specialty, are familiar with the patent named above. It will not, however, perhaps, be amiss to recapitulate, in brief, its history, and to state the present relative position of its assignee with photographic artists.

The patent was issued on the 11th of July, 1854, to James A. Cutting, of Boston. The principal claim embraced in it, is the use of bromide of potassium in combination with collodion. The issue of the patent caused a considerable excitement throughout the country. Societies were formed among the photographers in Boston and New York "to resist it to the very death," and money in abundance subscribed to defend any one who might be prosecuted for infringement. In 1858, William A. Tomlinson, the assignee of the patent for the city of New York, commenced a suit for infringement against C. D. Fredericks & Co., of that city. They determined to stand the claim and make it a *test suit*. Able counsel were employed, and all accessible testimony gathered from American and European scientific journals, to show, if possible, the lack of claim to novelty in the invention. The suit was still pending at the commencement of the war; and, owing to circumstances growing out of it, was continued until 1865. In that year T. H. Hubbard became general assignee of the patent, and gave notice that he should press the suit at once. Messrs. Fredericks & Co. became satisfied that it was useless to prolong the contest, and submitted to a judgment against them. They then, by the payment of a sum of money, made an arrangement by which they secured a license to use the invention for the remainder of the term for which the patent was granted; and in conjunction with several others, published a card detailing the facts, setting forth their belief in the impossibility of defeating the patent, and recommending all parties who were using collodion for photographic purposes, to make arrangements as they had done.

The Philadelphia *Photographer* for January of the present year, has an article on the subject, in which the opinion is expressed that the case is fully settled, and that it will unquestionably be the cheapest and quickest and best way, to submit. It has been fully decided that "the use of a known equivalent to an infringement," and that, "although the patentee has not expressly claimed equivalents, he does in contemplation of law embrace them without any express mention." In the said article, a letter from Mr. Hubbard is introduced, in which he states that nearly all photographers in New England, and many in other States, have settled the matter. He proposes terms which he submits as fair, while at the same time he announces his determination to take stringent legal measures against all those who refuse to meet him. He says, "I claim as infringers all who use a 'Bromo-Iodized Collodion' for photographic purposes."

In the October number of the same journal, Mr. Hubbard publishes a French formula in which the bromide and iodide of cadmium, are used instead of those of potassium, and in very different proportions from those named in the patent. This formula has been sent to him with the question whether it is sufficient to defeat the Cutting Patent. He answers that it does not even touch its validity. He adds: "Photographers may go on and keep 'fishing up' such fossil defences as this; and, in the end, they will find that I am not to be intimidated, but shall give them all an opportunity to invest in litigation upon the subject to their heart's content." He furthermore says, that he does not propose to give them the benefit of a combination to defeat him, inas-

much as the law gives him a remedy. In support of this point, he quotes the language used by Judge Storey, in a certain case: "It would seem that a combination of persons to resist a patent, approaches very near, if it does not actually reach, a criminal conspiracy." Mr. Hubbard closes the communication by insisting that it is for their own interest that "he warns photographers not to attempt to evade or defeat the bromide patent."

Messrs. Bradley & Rulofson, of this city, have become possessed of the sole right in this patent for the Pacific coast. We understand that they now offer to meet in a liberal spirit, and on satisfactory terms, all photographers who choose to adjust the matter with them, while they intend to enforce the law against those who stand aloof, and persist in their use of Bromo-Iodized Collodion, or its equivalent, without the payment to them of a consideration to be agreed upon, which will doubtless be based upon the rank among operators which is held by the respective artists.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

RECENT INVENTIONS.

"GUN CLOTH" is the name given an article by the *London Builder*, the inventor of which claims for it great advantages over gunpowder, gun-cotton and other explosives. It is intended to supersede the use of gunpowder, and all similar explosives, for all the purposes of throwing projectiles and for blasting.

The patentee claims for the gun-cloth charges freedom from all risks of accidental explosion, except when confined in a gun barrel or bomb-shell. They are non-explosive, they burn but do not explode, and if lighted and held in the hand they are harmless—in fact they may be dropped down a red-hot barrel without fear of danger. A hundred may be lighted at once, and the result will not be more explosive or dangerous than the fire of a lot of shavings. Neither would the firing of a whole magazine be attended with more danger than the burning of so much wood or cotton paper. The recoil is scarcely perceptible; the report is only one-half; smoke there is none, the combustion is perfect, and there is no residue left to foul the barrel; and withal, these charges are superior to gunpowder as a propelling agent—at least so says the inventor. Gun cotton was, as formerly made and used, an uncontrollable, unmanageable, capricious force, besides being liable to ignite at a low temperature and fire by spontaneous combustion. Gun cloth, this patentee says, as made according to his patent, is a strong but docile servant; weight for weight many times stronger than gunpowder, and capable of being used with entire safety in existing firearms.

A NEWLY INVENTED and novel kind of anchor was recently tested in Baltimore harbor with marked success. The anchor is triangular shaped, with six flukes, which work on pivots, and when one side is imbedded in the soil, the upper part closes; thus, it is claimed, preventing fouling, which is the cause of many ships being lost.

PATENTS RECENTLY ISSUED.

TURBINE WATER WHEEL.—A. Lind, San Francisco, Cal.: This invention relates to a new and improved turbine water wheel, and it consists in constructing the rim of the wheel entire, and placing the stationary buckets in the upper part of the rim, to be cast with the rim. Stops are placed at intervals above these stationary buckets, to be opened and closed in order to utilize the head of water. The power wheel is placed below the stationary buckets. Its upper portion revolves on a flange, which completely surrounds the lower portion of the rim, being a part of it. By this means leakage is prevented. When the rim of the rotating wheel or the flange becomes worn, the vertical shaft carrying the wheel is keyed up from the shaft, thus forming a tight joint. I claim, in combination with the stoppers, H, H', the stationary wheel, C, and revolving wheel, A, substantially as described.

QUARTZ MILL.—Cummings P. Colby, of Laacha Plana, Cal.: This invention relates to an important attachment to stamps used in quartz mills, and it consists in lowering the cam shaft used in stamp batteries to near the top of the mortar, and surrounding this shaft with eccentrics; also surrounding each eccentric with a collar, from which extends an up-

right arm, through which a horizontal spring passes, having a chuck at the end, through which the stamp stem passes, and is kept in place by a set screw. A vibrating bar is placed above the spring and attached to the frame of the machine. At the end of this bar is attached a strap, through which also the spring passes. In this strap is placed an iron chuck, which is pressed down upon the spring by a set screw, thus regulating the action of the spring. By this arrangement a quick percussion blow is given to the rock, and the elasticity of the strap regulated by the set screws. The inventor of this machine claims a large advantage over the ordinary quartz mill, as many more blows may be struck in a given time than by the use of stamps arranged in the ordinary way. I claim the combination of the eccentrics, B, with collars and spindles, and spring, A, arranged to operate the stamps substantially as described.

WASHING MACHINE.—Alexander Badlam Sr., San Francisco, Cal.: This invention relates to so dividing the bottom portion of the machine that the clothes will be above the dirty water, resting on concave hars set edgewise. The beater is a half round piece of wood, corrugated or not, as the case may be, and curved to correspond with the concavity in the elats. Upright arms are attached to the beater, with a loose cross roll or handin, which renders the machine very easy to work. I claim the combination and arrangement of the wnter box with curved slats, a, metal dogs, e, e, serving as weights, handle, e', and dashboards, c, c, the whole being constructed and arranged for joint operation substantially as described.

MACHINE FOR WASHING AND SAVING GOLD. M. A. Woodside, of Georgetown, Cal., has invented a new and improved machine for saving gold, which he calls "Woodside's Endless Blanket," and consists of a machine driven by pulleys, around which an endless blanket of canvas is drawn. A perforated box is placed across the machine, into which the ore or dirt is introduced. A perforated pipe is also placed across the machine above the box, through which jets of water pass, washing the debris downward, while the heavier and valuable particles are carried upward on the endless blanket, and are discharged into a water tank at the head of the machine by means of revolving brushes. By this means the necessity of frequently washing the blankets is obviated. 1st. I claim the endless blanket, H, and revolving brush, K, when arranged substantially as described for the purposes set forth. 2d. The perforated feed box, I, and water pipe, J, substantially as described and for the purpose set forth.

SPICE BOX.—Wallace A. Miles, Meriden, Conn.: The object of this improvement in spice boxes is to prevent the loss of the aroma of their contents. This is accomplished by making them tight and close when not in actual use, their tops being so arranged as to be easily and readily opened to allow the spice to be shaken out after the manner of sprinkling or dredging powdered substances out of a box.

Patents can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, in one-half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE.

DEWEY & CO.,
Patent Agents, 505 Clay street, San Francisco.

A NEW ROCK DRILL.—We understand that Mr. R. A. Thomas, the inventor and patentee of the new drill to which we made brief allusion last week, proposes to visit the mines, in person, with the view of introducing the same. He will take with him one of the machines, which weighs about 150 pounds, and give practical illustrations of its value. The instrument is properly a machine hand drill, and works by pressure with a ratchet; the drill being held to its place by convenient appliances. It is designed to work only in moderately soft rock, but too hard to remove by the pick or gad, each, for instance, as the slate which usually underlies the cement diggings of the ancient river beds. The inventor is a practical miner, and devised the machine for the express purpose of tunnelling in such rock, in his cement claims at Damascus, Placer county, at which place several of the machines are now in use. Mr. Thomas estimates that this drill has saved him at least \$1,000 in two years' working of his claim.

ANOTHER NEW GUNPOWDER.—A letter from Paris states that a German has brought to that city a new gunpowder, invented at Leipsic, which does not explode in the open air when inflamed, but burns like tinder. But in a close cavity it explodes with much more force than any other known species of powder; it is cheaper than ordinary gunpowder, and can be manufactured anywhere. Its ingredients are, however, kept secret.

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. nol0

Our Patent Agency.

The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Its correspondents are men of science and learning, and hail from all parts of the coast. It is published at San Francisco, at \$3 per annum, or \$3 for six months. Address Dewey & Co., publishers of Mining Press, San Francisco. (Nye County News.)

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Bag, Serey and Drop Presses, Coling Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Salvo Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Fine, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Vench's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Oaring, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

DECISION AGAINST THE EXTENSION OF A
PATENT.—The Commissioner of Patents has
decided that the Yale patent upon cast, chilled
and wrought iron burglar and fire-proof safes
and vaults, dated October 19th, 1852, ought
not to be extended or renewed for a new
term or a term of seven years from to-day, on
the ground that the invention and improve-
ments contained in the patent were the inven-
tions and improvements made by Lewis Lillie,
of Troy, N. Y., as the originator and first
inventor, and embraced in and covered by the
re-issue of his (Lillie's) patent, dated Novem-
ber 21st, 1865, it being a re-issue of a patent
granted on his application—July 15th, 1851.

COSTA RICA GOLD MINES.—It is reported
that a lot of gold dust has arrived in Paris
from Costa Rica. It is said to consist of
about 1,000 pounds of pure gold, and several
specimens of mineral. The latter have been
sent for analysis to the Mining School in Paris.
This is the first result of the efforts of a French
company to which ten gold mines have been
conceded by Dr. Castro, the new President of
Costa Rica. The director of this company is
a French General, named Gallemer, who has
obtained the Emperor's permission to take for-
eign service, and now holds rank as General of
Engineers under Dr. Castro.

THE New York millionaire, A. J. Stewart,
proposes to devote one million of dollars to the
building of small tenement houses for the use
of the working classes, to be let at a low rent,
suited to the means of those in receipt of but
small incomes, and to devote the accumu-
lation of receipts for rent, etc., to the exten-
sion of the undertaking. For this purpose Mr.
Stewart has applied to the municipal authori-
ties for a grant of land, stipulating that the
sole management of the matter, the appoint-
ment of trustees, and one or two minor points,
should be vested in his hands.

METALLIC ABSORPTION.—Snuff, when kept
in metallic vessels, possesses the property of
metallic absorption; thus, when kept in a
lead vessel, it will soon become poisonous
by taking up a portion of the metal—so says
the Druggists' Circular. If so, why does not
tobacco become poisonous from the same cause
when wrapped in tin-foil?

generally, made to order, and warranted to give perfect

satisfaction in every particular. 25v12-3m

"CAPPING OUT."—In an answer to the paragraph in the Nevada Gazette, in relation to "ledges capping out," which we quoted in our last week's issue, the Sun says:

It is true that in the rage for locating, which prevailed last year, everything that wore the semblance of croppings was taken up and called a mine. In such instances it has often happened that within a few feet of the surface all indications of a ledge disappeared, but except in one solitary case we have yet to hear of a vein that could be traced down twenty feet which "pinched out."

The Board of Directors of the Agricultural College, passed, at their last meeting, the following among other resolutions: That all questions pertaining to the location of the Agricultural Mining and Mechanical College be postponed until March 13th, 1867. And, that when this meeting adjourns, it adjourn to meet at the Governor's office, in Sacramento, on the 13th day of March, 1867.

It is reported that an inexhaustible bed of valuable white clay has been found on the estate of a Georgian, who has just returned from his exile in the North.

MELLVILLE C. KEITH, M. D.

Rheumatism!!

ANOTHER WITNESS!

SALMON FALLS, June 17, 1866.
H. BOWMAN—DEAR SIR: HAVING HAD A PAIR
of test of the virtues of RICHARDS' REMEDY FOR RHEU-
MATISM, I take great pleasure in stating that it has done
me have been even better than its recommendations claim.
In 1863 I first heard of the Medicine. I had then been for
three years severely afflicted with Rheumatism, and hav-
ing tried everything I could hear of, without any perma-
nent benefit, I concluded to try this also.
On taking the medicine, in three days I experienced great
relief, and in one week was entirely free from pain, and had
completely recovered the use of my limbs, which had be-
come almost powerless, so much so that I could not dress
myself without assistance. Since that time I have been
free from Rheumatism. I have recommended RICHARDS'
REMEDY to numerous friends, and in every case it has proved
successful. I therefore take great pleasure in recommending
it to all who are afflicted with Rheumatism, and es-
pecially to all mercurial chronic Rheumatism cases.
Yours respectfully,
(Signed) ERASTUS PARSONS,
President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento.
Price, \$2.50 per Bottle. 11v13

Important to Californians.—Many inventors have
lately had their claims for Patents seriously (and in some
cases fatally) delayed by the unqualification of agents who
have not complied with the Government license and revenue
laws, as well as other new and imperative regulations.
These discrepancies, although arising from the inexperience
of honest agents, are none the less dangerous to applicants
for patents, whose safest course is to trust their business
with none but active and experienced solicitors. The MIN-
ING AND SCIENTIFIC PRESS PATENT AGENCY has strictly com-
plied with the requisitions of the Department, and properly
filed all necessary papers as Claim Agents.

Pacific Law and Collection Office

W. H. ALLEN,

Our Circulation.—THE MINING AND SCIENTIFIC PRESS
has a large and permanent subscription list, and enjoys a
more universal circulation among stockholders and per-
sons directly interested in mining than any other paper on
this coast.

CONNECTICUT

Mutual Life Insurance Co.

The Largest Life Insurance Com-
pany in the World.

ASSETS.....\$12,000,000.

THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE
Insurance Company in the world, and it has

The Largest Number of Members,
The Largest Amount Insured,
The Largest Surplus,
The Largest Business,
The Largest Income,

And as it obtains the LARGEST average rate of interest on
its investments, and has had, through its whole history,
the SMALLEST average expenses, it therefore affords in-
surance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy
Holders during the current year is SIXTY PER CENT. of
the premiums paid during the year ending 31st of January,
1868.

Insurance can be effected in this Company in all the
forms desired, and to meet all the contingencies to which
Life Insurance is applicable, among which forms are—
Whole Life Policies, by a continued annual life
premium.

Whole Life Policies, by TEN annual premiums.
Endowment Policies, by a continued annual
premium.

Endowment Policies, by a limited annual pre-
mium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age
stipulated.

ALL POLICIES issued by this Company are either un-
forfeitable by their terms, or may be converted into those
which are so, at the option of the insured.

This Company offers all the advantages of a CASH or
NOTE Company. The assured are not required to give a
note in part payment of the premium, but may, if prefer-
red, pay the first four premiums in cash after which their
dividends on Annual Premium Life, and Continued Pre-
mium Endowment Policies, will, if the past success of the
Company is continued, reduce their premiums ONE HALF.
When notes are given for Annual Life and Continued En-
dowment Premiums, no notes will be required after the
fourth payment, and the returned surplus—dividends—
will be applied as cash to the reduction of the annual
premium.

None but Unexceptional Risks Accepted; and
only upon ages between Fourteen and Sixty.

DIRECTORS:

JAMES GOODWIN, HENRY C. ROBINSON,

Accidental Insurance!

The Accidental Insurance Company

OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF
all kinds, and death resulting from accident.

In case death does not result from the injury, the insured
receives a weekly compensation, as long as he is disabled
(not to exceed twenty-six weeks).

ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensa-
tion of \$5.

\$10 will buy Policy for \$2,000, with weekly compensa-
tion of \$10.

\$50 will buy Policy for \$10,000, with weekly compen-
sation of \$50.

SHORT TERM POLICIES.

Policies will also be issued for any other amounts within
the limits before stated, for periods of one to six months,
at rates in tents of the Annual rate, as follows:

1 month, 2-10.	4 months, 5-10.
2 " 3-10.	5 " 6-10.
3 " 4-10.	6 " 7-10.

GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by
many of its Agents at Hotels and Ticket Offices through-
out the country.

They make Insurance for \$5,000, and \$25 per week com-
pensation, against Accident of every description, Traveling
or otherwise; good for one to six days, as required, at
TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which
cover only injury or death, the result of an "Accident to
the Public conveyance in which the insured may at the
time be traveling," but they are GENERAL ACCIDENT
TICKETS.

SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and
other Ports. Rates varying with the season, and the voy-
age to be taken. Information can be had of the Company
or its Agents.

The Company has PAID UP CASH CAPITAL OF
\$250,000. One hundred thousand dollars deposited with
Wm. Havens, Esq., Superintendent of the Insurance Depart-
ment of the State of New York, and the remainder securely
invested in Stocks in the hands of the Company.

INDUCEMENTS.

The rates of Premium are very low.
The Plan is so simple that any one can comprehend all
its workings.

NO MEDICAL EXAMINATION IS REQUIRED, and those who
have been rejected by Life Companies, in consequence of
hereditary or other diseases, can effect Insurance in this
Company at a very small cost.

No better or more satisfactory use can be made of so
small a sum.

For Policies or further information, apply to

 patched for CHINA on TUESDAY, January 1, 1887.
 For passage and all other information, apply at the Pa-
 cific Mail Steamship Co's office, corner of Sacramento and
 Leidesdorff streets.
OLIVER ELDRIDGE, Agent.

Illegal Supplemental Advertising.—It
 would be well for Mining Companies, whose advertis-
 ements are repeatedly appearing in the Supplements of
 daily papers, to inquire into the legality of that class of
 advertising.

THE MINING AND SCIENTIFIC PRESS, published by Dewey
 & Co., San Francisco, should be in the hands of every
 miner. It gives every week information that is indispen-
 sable to the proper prosecution of mining. Every miner
 can avail himself of the latest improvements by subscrib-
 ing for it.—[Havilah Courier, Oct 13.]

New Mining Advertisements.

Chaparral Hill Gold and Silver Mining Com-
pany, Albany Flat or Hill District, Calaveras County,
California.
 Notice is hereby given, that at a meeting of the Board of
 Trustees of said Company, held on the seventh day of
 November, 1886, an assessment of fifteen cents (15) per share
 was levied upon the capital stock of said Company, payable
 on the fifteenth day of November, 1886, in United States
 gold and silver coin, to the Secretary, A. de SENAIGHAC,
 at the Company's office, 606 Montgomery street, San Fran-
 cisco, Cal.

Any stock upon which said assessment shall remain un-
 paid on the tenth day of December, 1886, shall be
 deemed delinquent, and will be duly advertised for sale
 at public auction, and unless payment shall be made before,
 will be sold on Monday, the thirty-first day of December,
 1886, to pay the delinquent assessment, together with
 costs of advertising and expenses of sale. By order of the
 Board of Trustees. A. de SENAIGHAC, Secretary.
 Office, 606 Montgomery street, San Francisco. no10

Colorado Silver and Copper Mining Company.
 Notice.—The Annual Meeting of the stockholders of the
 Colorado Silver and Copper Mining Company, will be held
 at the Company's office, No. 528 Clay street, San Francisco,
 on MONDAY, December 24th, 1886, at 8 o'clock P. M., for the
 election of Trustees, and the transaction of such other bus-
 iness as may properly come before it.
 no10-4w B. W. MUDOE, Secretary.

Del Norte Constock Company, Low Divide
District, Del Norte County, California.
 Notice is hereby given, that the Annual Meeting of the
 shareholders of the above named Company will be held on
 MONDAY, the third day of December, 1886, at 7 1/2 o'clock
 P. M., at the office of the Company, No. 331 Montgome-
 ry street, San Francisco, for the election of Trustees to serve
 the ensuing year, and for the transaction of other business.
 R. N. VAN BRUNT, Secretary.
 San Francisco, November 15, 1886. no10

And upon which said assessment, the shareholders unpaid on the 15th day of December, 1866, shall be deemed delin-

quent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirty-first day of December, 1866 to

on Monday, the thirty-first day of December, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of

Office, Room No. 22 Court Block, 636 Clay street (up stairs),
San Francisco, California. no10

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Müller; C, Legs; D, Cross-Framework; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective millers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the miller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burned. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture, and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
- PACIFIC FOUNDRY, San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 80 feet fall. Let us know how much water you have either in miller's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to
- KNAPP & GRANT, San Francisco.

Leffel's Lever Jacks, For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by
- KNAPP & GRANT, San Francisco.

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG, 87-13-15 Stove Store, No. 125 Clay street, below Davis.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict confidence with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Patent Right for Sale.

I WILL OFFER FOR SALE, UNTIL THE SEVENTEENTH day of November, 1866, the Patent Right of a new and effective Drill.

FOR DRILLING SLATE BED ROCK, And other similar kinds of rock. There is a large amount of rock tunneled in California, for which this Drill is just the thing that is needed.

The Patent papers (dated August 7th, 1866) can be seen by parties interested. A working size machine, now being constructed, will be ready for exhibition in a few days. Address the subscriber at the Office of the MINING AND SCIENTIFIC PRESS, or call on me at the same place, 505 Clay street, between three and four o'clock, P. M.

R. A. THOMAS, Inventor and Patentee. 19v13
San Francisco, November 10th, 1866.

THE BESSEMER AND MUSHET CONTROVERSY.

In our issue of Nov. 3d, in the course of an article on the "Progress in Iron and Steel Manufacture," we alluded to the claim which Mr. Robert Mushet had set up on moral grounds, to remuneration from Mr. Bessemer, for the use of his "spiegeleisen" invention. The unfortunate "lapse" of his patent right through the negligence of the trustees in charge, had of course barred all legal claims. The summing up of the newspaper controversy, and the present position of the parties, will be made apparent by a few extracts from two long communications to the London Mining Journal, of recent dates; one of which, in the number for Sept. 8th, is from the pen of Mr. Mushet, the other, in that of Sept. 22d, from that of Mr. Bessemer. Mr. Mushet says:

"Mr. Bessemer seems to be under the impression that I wished to claim the use of manganese generally and exclusively in the manufacture of steel. I had no such wish, being well aware that the use of manganese in the manufacture of steel had been more or less adopted for upwards of half a century before the date of my patent. What I claimed was simply this: The addition of melted spiegeleisen to melted pneumatically cast iron; in other words, a novel and useful application of a known substance to a novel method of manufacturing iron and steel. Mr. Bessemer also appears to think that my patent was taken out with a design to crush and cripple the progress of his own invention. So far was this from being my wish or intention, that one chief object I had in view was the speedy development of Mr. Bessemer's process, which I well knew was the greatest metallurgical invention of modern times. * * I was about the only one who appreciated and defended Mr. Bessemer's invention from the unsparing ridicule which many, who ought to have known better, were not slow to heap upon it. In short, Mr. Bessemer struggling with difficulties was one individual, and Mr. Bessemer as the successful inventor is now viewed in a very different light. * * I cannot but think, that when he has well weighed the matter, he will come to the conclusion that I have a strong moral claim to receive some pecuniary acknowledgment," etc., etc.

Mr. Bessemer, in his communication, declares that the whole thing was a scheme concocted between Mushet and a Mr. Brown, to obstruct the practical development of his invention, by depriving him of the use of manganese even by the old and well known methods; with the view of inducing him to buy off the conspirators. He says that "the genuine inventor knows, to his cost, that horrid parasite, the 'speculative patentee,' a character, who, though without any originality, has nevertheless a capacity of readily appreciating a novel and valuable invention; and who, upon the appearance of such an one, sets to work to patent everything that may obstruct its progress, and then quietly waits to be bought off." Mr. Bessemer further says, that having become convinced that Mr. Mushet's patent possessed so little novelty, and was so far anticipated by his own patent, that it could not be sustained, he had commenced to make use of spiegeleisen before the lapse of right referred to; having resolved deliberately to do so after consulting eminent counsel. He therefore utterly repudiates and denies that even the shadow of a moral claim, exists against him on the part of Mr. Mushet. In alluding to certain attempts which have been made by the friends of Mr. Mushet, to influence him by threats of expensive litigation, he simply remarks that if any persons should be unwise enough to undertake the repeal of his patents, they will find him prepared with sufficient means and sufficient evidence to carry his cause successfully through every court in England up to the House of Lords.

He closes with these words: "I must now take a final leave of this most unpleasant subject. I have no ill-will for Mr. Mushet, but I feel neither respect nor friendship for him. The world is wide enough for both of us, and I think it would be well for him to allow a subject to rest, the discussion of which can neither bring him honor nor profit."

ECONOMICAL SIEVES.—A very convenient and economical sieve for sifting dry powders may be made, by taking a piece of stiff white paper and punching it with a needle—the size of the needle, of course, determining the fineness of the sieve. It may be secured to a drum in the ordinary manner of fixing a sieve. Where extreme fineness is required, such a sieve will often be found very convenient and cheap.

Brevities.

A MINERS' and Mechanics' Institute is talked of for Colorado.

RAILROAD communication between the Black Sea and the Baltic will be complete within a year.

SPLENDID long staple, silky cotton is being raised in the Sandwich Islands by Henry J. Whitney.

STRAW PAPER is now worth \$3.50 per ream. Some of the large paper mills in the Atlantic States have ceased to manufacture anything else.

HOUSES eleven stories in height are now being built in Paris. Platforms ascend and descend every minute, and furnish the means of communication between the different stories. There are no stairs.

A MECHANIC who was employed to place the engine and boilers on board the Evening Star, says they were old, and in reality unfit for service for the last two years.

IN some of the Owyhee claims, Idaho, miners are paid in greenbacks at par, instead of gold dust, which in that region is of indefinite value, owing to the mixture of various sorts, and the frequent counterfeits.

At a late meeting of the British Association for the advancement of the Arts and Sciences, Mr. Bessemer said that the American iron which he had seen was peculiarly adapted to the manufacture of steel by his process.

J. D. PETERS, grain and commission merchant, of Stockton, has prepared four sacks of wheat to be sent forward to the Industrial Exhibition at Paris. The bags are of satin, and are covered with linen.

By the 20th instant the locomotive will be running to Cisco, which is ninety-three miles from Sacramento, and at an elevation of six thousand feet. Yaakees think nothing of building railroads over mountain ridges. Work will be continued throughout the winter on the other side of the Sierra, below the snow line.

SEVERAL tons of valuable copper ore were received in this city a few days ago, from one of the mines in the Peavine district, on the Truckee river, near Crystal Peak, Nevada. This ore was brought from Alta by the Central Pacific Railroad, being the first shipment from that section of Nevada.

The volcano Popocatepetl has recently been explored by a party which reports the crater accessible. Millions of tons of sulphur are lying there, and in many places in a pure state. It can be carried to the summit of the volcano, and from thence to the base of that eternally snow-crowned mountain, at an expense of only fifty cents the hundred pounds. The value of one hundred pounds in Mexico is \$10.

Mammoth Quartz Lode, Keysville District, Kern County.

"To all whom it may concern,"
ALL PARTIES negotiating for interests in the above Lode, would do well to examine titles before investing, as the legal title to a considerable portion thereof is vested in the undersigned.

Begin to inform purchasers that they have just received a large stock of Glasgow and Staffordshire best refined Bar Iron, Boiler Plate, Anvils, Cast Steel, Boiler Tubes, Gas and Water Pipes, GAS FIXTURES, etc. They offer the same for cash, on liberal terms, at wholesale and retail. The Company have superior facilities for supplying the constant demands of the market.
Country Orders punctually attended to. 19v13-q

IMPORTANT
—TO—
WORKERS OF GOLD & SILVER ORES.

THOSE INTERESTED WILL FIND IT TO THEIR ADVANTAGE to call on MR. WILLIAM SLOSSON, at Prof. W. P. Blake's Office, and obtain a Business Circular, just published by the WURTZ AMALGAMATION COMPANY of New York, who have secured, under the Patents of Prof. Henry Wurtz, the sole and exclusive right to the use of soda in amalgamation. Mr. Slosson is prepared to supply the business of the Company, with the material for applying this new and wonderful discovery, by which, in the words of President Barnard, of Columbia College, "two grains of gold may be gathered where but one was before." 19v13-2m

Knox's Improved Patent Amalgamator and Separator, With Palmer's Patent Steam Chamber or Die.

For further particulars, inquire of
19v13-12q

THIS CUT REPRESENTS AN AMALGAMATOR and Separator that has stood the test of eight years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mill built in the latter Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much Less Cost.

2d. They do not "hour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "clogging" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

ISRAEL W. KNOX, or
W. A. PALMER, Inventors,

At the Golden State Iron Works, No. 19 First street, San Francisco.

CAUTION!

NOTICE.—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1864, and issued June 27th, 1865, to Professor Henry Wurtz, for the use of Sodium and Amalgam thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY,
OF NEW YORK,

Assignees of letters patent granted to Prof. HENRY WURTZ, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.
The terms and conditions upon which rights to use the process are obtainable, can be had on application to
W. M. SLOSSON,
Agent of the Company, Union Iron Works, corner of First and Mission street, San Francisco. 19v13

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Crushing or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the crushers are enabled to offer these machines to the public at the following low terms:
No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—price, \$850
No. 3—Or 20-inch Crusher, with a similar main shaft, crush from seven to eight tons per hour—price, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, built with heavy wrought iron bars, making it very strong, and at the same time light and portable. The crusher is bolted to a wooden frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.
The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county:
RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.
JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
R. P. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED OERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in California and Nevada. Diagrams and explanations are furnished on application to the subscribers.
A drawing and full description of this machine will be found in the Mining and Scientific Press, of Sept. 22d, 1866.

Strict attention will be given to all orders for Book and Pamphlet Printing entrusted to the Mining and Scientific Press Job Office.

Excelsior Double-Acting Suction and Force Pump.

The Best for Mining, Farming and Domestic Use.

THE EXCELSIOR PUMP is a California invention of intrinsic merit, and as such is being rapidly introduced, and giving perfect satisfaction. At the Mechanics' Institute Fair (1865), it was awarded, for its superiority, a

Premium Medal.

It is manufactured by California Mechanics, in the most perfect and durable manner.

It is remarkably simple in construction, and its valve chest is almost instantly accessible without disconnecting the air-chamber, suction or discharge-pipes. It can be worked at any speed.

Figure 1 is a sectional view of a 6-inch Mining Pump, showing the plunger and hemppacking, and the valve-chest containing the puppet valves. Fig. 2 illustrates the water-passages and valve seats in the chest.

The following sizes are constantly manufactured of this

SUPERIOR DEEP-WELL PUMP.

- No. 1.—Cylinder 2½ inches; stroke, 6 inches; capacity 750 gallons per hour; weight, 60 pounds.
- No. 2.—Cylinder, 3 inches; stroke, 7 inches; capacity 1,250 gallons per hour; weight, 80 pounds.
- No. 3.—Cylinder, 4 inches; stroke, 9 and 8 inches; capacity, 2,500 gallons per hour; weight, 200 pounds; with iron frame and slide complete.
- No. 4.—Cylinder, 5 inches; stroke, 15 inches; capacity 5,250 gallons per hour; weight, 200 pounds.
- No. 5.—Cylinder, 6 inches; stroke, 24 inches; capacity 12,575 gallons per hour; weight, 1,000 pounds.

The Nos. 3, 4 and 5, are made to endure the severe test of use in mines, and are constantly superseding those of other manufacturers. The pistons being packed with hemp, are proved to be far more durable and less expensive than leather.

We manufacture to order 8 and 10-inch Pumps. Also, sell at cheap rates, 5 and 6-inch Brass Pumps for ships.

For Circulars, or further particulars, inquire of or address J. W. BRITTON & CO., Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or CUSHING & CO., Prop'rs. San Francisco.

WORDS FOR MINERS.—The Gold Hill Daily News, Nevada—a medium of good authority—saith thus:

The MINING AND SCIENTIFIC PRESS is a weekly journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would tend vastly to the particular "posting" and general enlightenment of our sort of working folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have an agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

CHURCH AND STEAMBOAT BELLS,

TAVERN AND HAND BELLS AND GONGS.

FIRE ENGINES, FORCE AND LIFT PUMPS,
Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, &c.

HYDRAULIC PIPES AND NOZZLES
For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Couplings joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."
Highest Market price paid for OLD BELLS, COPPER AND BRASS. 8v12

Pacific Map Depot.

Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the Mining and Scientific Press.

Orders from the interior faithfully attended to.

Endorsement by the Miners' State Convention

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

THE MINING AND SCIENTIFIC PRESS.

Terms: One Year, \$5; Six Months, \$3.

Single Copies, Fifteen Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS,
And Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 24, 1866.

California Academy of Natural Sciences.

REGULAR MEETING, Monday, Nov. 19, 1866.

President in the chair.

Seventeen members present.

Minutes of previous meeting read and approved.

Mr. J. B. Russell and Dr. E. Bell were elected resident members.

Donations to Cabinet.—Specimens of copper ore from Balajaqua, Chihuahua, presented by Mr. R. C. Jacobs.

Donation to Library.—Pamphlet on the Polyps and Corals of Panama, by A. E. Verrill.

Prof. W. P. Blake read several mineralogical notes, which were on motion referred to the Publication Committee.

A paper was received from Mr. W. M. Gabb, upon certain cretaceous fossils collected near the south end of Clear Lake.

Remarks in connection with certain fossils described by Mr. Conrad, elicited from Prof. Blake the reply that the species referred to were collected by himself, and were in exceedingly good condition; that the number of specimens was not meager, but in quantity sufficient to fill a quarto plate with figures.

Prof. Blake read a paper upon a fossil fish found in the Great Basin, Nevada; referred to the Publication Committee.

Prof. Blake also directed the attention of the Academy to specimens of the fossil vertebrae, collected by him in Tulare county. These specimens are about twenty in number, and are from two to six inches in length, and two to three inches in diameter. He believed them to belong to large marine saurians, like crocodiles, but wished to make further study and comparison previous to making a more formal communication to the Academy. If correct in his opinion, it was, he believed, the first instance of the discovery of Saurian remains on the Pacific coast of the United States, and the discovery will be rendered still more interesting by the fact that the remains occur in strata reputed to be Miocene, associated with shurks' teeth and numerous marine remains, at least fifteen hundred feet above the present ocean level.

Prof. Whitney stated that the State Geological Survey discovered fossil specimens belonging to the ichthyosaurus, in this State some two years ago.

Prof. Whitney also stated that a large and interesting collection of fossils, from the south-easterly portion of Nevada, had been received from Dr. Blatchley by the State Geological Survey, comprising some twenty-five or thirty species.

Prof. Blake referred to Dr. Newberry's statement of the existence of silurian rocks along the cañon of the Colorado, and to his own statement of the probable existence of pre-silurian rocks in that region.

Dr. Gibbons announced the death of the distinguished naturalist, Dr. Augustus A. Gould, of Boston.

On motion, Messrs. Bolander, Whitney and Gibbons were appointed a committee to devise some plan for procuring essays, on different subjects, to be read at the meetings of the Academy. Adjourned.

THE CULTURE AND MANUFACTURE OF SILK.

The business of silk culture and the manufacture of silk goods, has long been a favorite idea with many people in the Eastern States. The first important attempt at the introduction of the silk business on this continent, was made in the State of Virginia during the reign of James I of England, but, notwithstanding its promising inception, owing to the great demand for tobacco which just then began to come into general use, and the large profit derivable from its culture, the filthy Indian weed soon got the advantage of the web of the Chinese worm, and Jamestown became noted for its tobacco, rather than for its silk, for which its climate and soil is so peculiarly favorable.

About the middle of the eighteenth century, some enterprising citizens of Georgia procured artisans and others skilled in the culture and manufacture of silk, and established the business in that State with such encouraging indications of success, that considerable quantities were exported, and Georgia silk was pronounced in Europe fully equal to the best that could be produced in Italy, and actually commanded the highest price in London of any silk in the market. The business was also at this time obtaining some foothold in Connecticut. Just as success, ample and remunerative, was beginning to be realized, the troubles which preceded the Revolutionary war, and finally the war itself, intervened, and effectually closed out that class of industry.

After the war was over, the general introduction and rapid growth of cotton at the South, and its manufacture at the North, opened up such a wide and promising field for enterprise that the silk business was almost entirely ignored, until a few speculators started the *moris multicaulis* mania of 1836-7. If no other advantage came of that speculation, it certainly produced a beneficial effect in once more calling the attention of the American people to the fact that the silk business was one which might still be advantageously introduced into this country. The idea of silk culture and manufacture has, in fact, never been lost sight of in the Atlantic States from that time to the present. Its progress has since been slow but continuous, until it is now assuming proportions of no little importance.

The chief interest in the silk business in this country is now centered in Connecticut. In Hartford and Manchester, in that State, the Cheney Brothers have established quite extensive silk manufacturing operations. They manufacture ribbons and dress silks, said to be in no way inferior to the very best imported. Tobias Kohn, a Hungarian, has also quite an extensive establishment in Hartford, and furnishes from thence the best articles of silk braid and trimmings to be found in the New York market.

But nearly all the raw material to supply these and other establishments comes from China, Japan and Southern Europe. There is no adequate reason, however, why our own country should not produce all the material necessary to keep our home manufactures running, and encourage thereby the erection of

others. The Southern portion of the Atlantic States is particularly well adapted to the culture of silk, and experience has also proven that it can be successfully and profitably cultivated in the Middle and most of the Northern States.

SILK CULTURE IN CALIFORNIA.

California, however, presents the most encouraging field for this business. No part of the world possesses so many and such decided advantages for raising the silk-worm, and we have here land enough to supply the entire country with the raw material. Mr. L. Prevost, of San Jose, well known as the pioneer silk culturist of this coast, has given almost his undivided attention to the business, for several years past, and acquired a fund of experience here, which, added to his knowledge of silk operations in Europe, will furnish our people with all attainable, and, in fact, all really desirable information concerning the business. With a spirit worthy of the highest praise, and without the most distant pecuniary end to gain, he has announced his willingness to furnish this information *free of cost*, to all who desire to make a practical use of it. This benevolent purpose he has already carried out, as far as he has been able to do, by personal intercourse and by private letters, and communications to the public press. In the furtherance of this disinterested effort, he is now engaged in the preparation of a

CALIFORNIA SILK MANUAL,

Which will contain, in the form of a small volume, the complete results of his experience and observations in silk culture, as particularly applicable to California. This work will soon be published, and will comprise the fullest and most complete information attainable for the economic and profitable culture of silk. It will comprise the result of years of experience and voluminous correspondence, all of which has been undertaken with the sole purpose of determining the best character of soil, the best species of worm and tree, and the fullest details of management suited for this State.

With this same object still in view, Mr. Prevost has recently furnished to the press throughout the State, for the guidance of those who may wish to know something of the price of cocoons, previous to engaging in producing them, the following information with regard to their value in France. The information here given is the report of actual sales recently made, and informs the reader from what localities the silk manufactures of Europe chiefly derive the raw material:

3,000 lbs. of Cocoons from Syria, sold for \$2.40 per lb.	
2,000 Nonka, .. 1.30 ..	
2,000 Nonka, .. 1.40 ..	
42,000 Nonka, .. 1.50 ..	
2,000 Acoulis, .. 1.50 ..	
4,000 Caucasus, .. 1.30 ..	
2,000 Andrianople, .. 2.50 ..	
2,000 Demirch, .. 2.40 ..	
1,000 Demirch, .. 2.00 ..	
1,800 Greece(yel), .. 2.40 ..	
3,000 Greece(yel), .. 2.30 ..	

It is highly necessary that those who are preparing to go into the business should know what they are about; hence Mr. P. has promised to keep them thoroughly posted. By referring to the above list of prices, it will be observed that the scale varies from \$1.30, the lowest, up to \$2.60, the highest; the price being regulated by the quality of silk which the cocoons will produce. Mr. Prevost writes us that he is confidently of the opinion that as soon as our people become conversant with the business we shall raise cocoons of the very best quality, and consequently shall be able to command the highest price. The price of cocoons raised here cannot be definitely fixed

until they are produced, and their quality determined. There need be no fears of the lack of a market for cocoons raised in this State, without the expense and delay of sending them abroad, for it has already been stated that Messrs. Neumann & Myers have fully determined upon the establishment of

A SILK MANUFACTORY

In San Jose, which will create a large home demand for all that can be raised, and at prices materially in advance of those which are paid in Europe for the same quality. During our recent visit to San Jose we had the pleasure of meeting these gentlemen in that place. They had just then concluded the purchase of twenty-five acres of land for their buildings, on which, we understand, they have already commenced work. It is their intention to have the manufactory in operation early the ensuing spring. Of course, it is not expected that California will immediately produce a sufficient supply of the raw material to keep the factory in operation; but our proximity to China and Japan, where the best silk is raised, will afford a plentiful supply until that want can be obtained at home.

While in San Jose, Mr. Prevost showed us a letter which he had just received from Mr. Rice, the United States Consul at Hakodada, in which that gentleman writes that it is his intention to soon resign his consulate and take up his residence in California, with the view of going extensively into the culture of silk. He purposes to bring with him several Japanese who are well versed therein. Mr. Rice has evidently looked carefully into the business, with the eye of making money out of it. Such a determination arrived at from his standpoint, should be received by Californians as a most encouraging indication that the business must prove highly remunerative here.

We learn from the Marysville *Appeal* that quite a number of the citizens in Yuba, Sutter, Colusa, Butte and Tehama counties contemplate planting mulberry trees the coming season. Great numbers in the San Jose valley and other central portions of the State purpose, also, to embark in the business; some of whom will go into it on a very large scale.

CALIFORNIA PECULIARLY ADAPTED TO THE BUSINESS.

The market for silk is as wide as the world, and there is no danger of its being overdone. The demand is increasing much faster than the supply. Silk sells according to quality, and experience has fully established the fact, which philosophy and chemistry had previously indicated, that California can produce a better silk fiber than any other portion of the world. The clear and quiet atmosphere of this State is peculiarly favorable for the undisturbed operations of the worm, and enables it to carry on its mysterious operations to the greatest perfection, and maintain a degree of healthfulness nowhere else observed. The beautiful and continuous sunlight of the summers of this State, scarcely ever, during the critical period of the existence of the worms, being disturbed by a cloud or thunder storm, constitutes the crowning feature of the peculiarly favorable nature of the climate—a feature which even Italy, with its boasted, halmy atmosphere cannot afford. Hence, we may reasonably infer, that, with proper energy, California may not only be able to supply her own manufactures with the raw material; but that when it is known abroad that she can and does produce the best quality of cocoons, every silk manufacturing country in the world will seek our shores for the coveted supply of the best material for their looms.

COBALT ORE IN CALIFORNIA.—Prof. Blake has recently described a cobaltic variety of arsenical pyrites from Meadow Lake, in Nevada county. The mineral is known as *Danait*, after the distinguished metallurgist of that name.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

Placers of Sierra County.

BY AN INDEPENDENT CONTRIBUTOR.

[Continued from Page 274.]

Even an attempt to locate and describe this ancient river and its tributaries, from its source to its mouth, without accurate maps, the reader must be aware, will be attended by almost insurmountable difficulties, and can but be approximated. I will, however, to the best of my ability, from evidence deduced from actual observation, endeavor to trace its course, asking the reader to accompany me on Bancroft's map of the State of California, published in 1864.

We find the first faint traces of the source of these important streams in the fortieth parallel of latitude, near the volcanic peaks of Plumas county, and the northern portion of Butte, capped and covered by volcanic lavas. The Middle Fork of the Feather river having flowed at right angles, has eroded its rocky covering, cut through its walls, and exposed its slightly water-worn gravel. From the head of its most easterly Fork to its westerly branch, it has served to drain an extent of country from seventy-five to eighty miles wide; thence flowing southerly, without regard to its sinuities, we find its mouth in the thirty-eighth parallel of latitude, a distance of more than one hundred and fifty statute miles, through the heart of the most productive auriferous belt of the Sierra range.

The source or extreme head of the Dahlenega (in Sierra county, known as the Blue Lead) was in the vicinity of what is now known as the Spanish Peak, in Plumas county; thence flowing southerly, east of Pilot Peak, and entering Sierra county, passing through Howland's Flat, Cold Cañon, Poker Flat, Monte Cristo, Excelsior, Forrest City, Alleghany, Chipps, Minnesota, and entering Nevada county, at Snow Point, flowing through Alpha, entering Placer county, at a point near Libertyville; thence through Iown Hill, Birds' Flat and Michigan Bluffs, it enters El Dorado county near that point; thence through Works Hill, Johnstown, Kelseys, Placerville, Diamond Springs, Logtown, and enters Amador county at Yeomere. At a point near Fiddle Town the river makes a considerable detour to the eastward, describing nearly the half of a circle, flowing in a southeasterly direction, between Volcano and Jackson Buttes, enters Calaveras county near Stony Bar; thence through Mokelumne Hill, it flows in a southwesterly direction through the extreme northern portion of Stanislaus county, debouching into the bay or ocean at a point near the easterly boundary of San Joaquin county, in the thirty-eighth parallel, where, owing to denudation and accumulation of alluvium, from washings of the Sierra range, covering and obliterating the remains of its bed and contents, its traces are indistinct and obscure.

Within the arc of the circle described, the channel of the river appears to have been repeatedly changed, gradually cutting channel after channel, in a westerly direction, the remains of which, and their numerous contents, cover a large area in Amador and the western portion of Calaveras county, when not obliterated and destroyed by the denuding agencies of the present river system, and originally forming a delta, whose extreme length was thirty-five by twenty miles wide at its widest point, forming the extensive placer fields for which these counties have been so justly celebrated. On its most westerly channel we find located the towns of Drytown, Amador, Suttersville and Jackson; and it passed from thence through the western portion of Calaveras, and uniting with the easterly channel at a point near the thirty-eighth parallel, on the borders of San Joaquin county. The Jackson Buttes shows strong evidence of having been an independent volcanic vent, and no doubt has, to a certain extent, occasioned this disturbance, from the repeated overflow of its lavas filling

the river banks and forcing its waters westerly through other channels.

The stream which I have designated as the Saranac, unites with the Dahlenega at or near its mouth, taking its rise at a point near the "Silver mines," in Calaveras county, flowing westerly and southerly for about twenty miles, where a fork comes in from the eastward, which takes its rise in Silver Valley; thence the Saranac passes on, forming the boundary line between Tuolumne and Calaveras counties, covered and capped by basaltic lavas for sixteen miles, where we find the volume of the stream again augmented by a branch which heads in Strawberry Valley, flowing through Columbia and Table Mountain; thence on its course near Knight's Ferry a still larger branch intersects, which flowed from the vicinity of the Green Mountains, through Sonora and Jamestown; thence nearly due east, to its confluence with the Dahlenega.

For a distance of fifteen miles, in a northerly direction from the head of the delta previously described, the Dahlenega appears to have had no eastern tributaries of note, until reaching the vicinity of Diamond Springs, in El Dorado county. Here the river designated as the Altan unites, flowing from the vicinity of the American Valley. Its traces are, however, indistinct, and the river of minor importance for its auriferous gravels; thence northerly, forty miles, on the boundary line between Nevada and Placer counties, an important tributary (which I will designate as the "East Fork") is observed, which has flowed from the northward, taking its rise in the vicinity of Nelson's Point, in Plumas county, and flowing southeasterly, passing near Jamison City, entering Sierra county at Gold Lake, its bed cut by the Forks of the Yuba river, at a point four miles east of the Downieville belt; thence down the ridge opposite American Hill; thence southwesterly, entering Nevada county at a point near Jackson, in Sierra county, and passing through Washington and Oneida, unites with the main stream at the place designated. This fork is easily traced, and plainly marked for its entire distance (where not destroyed by the present river system), by a capping or covering of lava and tufa, which has flowed from the volcanic peaks near its source, filling its gorge from crest to crest. The Forks of the Yuba, in their westerly flow, have in places not only destroyed this almost indestructible material, but cut gorges hundreds of feet below the beds of these ancient streams, exhibiting nearly vertical sections of the stratified auriferous deposits. There are several small tributaries of this fork that have taken their rise near Galloway's Hill, in Sierra county, and flowing easterly, unite with the main stream opposite American Hill, forming gravel deposits of note for their auriferous yield. Nebraska City is the most noted locality.

In article of November 10th, for "broken up," read "opened up;" for "Lamijar," read "Lamine;" for "velo 125 feet long," read "chute;" for "Woods & Warren," read "Woods & Warner;" for "past history and disbursements," read "developments."

[Written for the Mining and Scientific Press.]

Southeastern Nevada.

BY J. D. EMERSON.

About one hundred and forty miles southeast of Austin, and not more than sixty miles from Pahranaagat, is located the Reveille mining district—so named in honor of the little daily newspaper which stands up so spunkily for the interests of the Reese River country. Amongst the many rich discoveries made this summer in the southeastern portion of the State, represented by Silver Bend, Northumberland, Danville, Marcy, Hot Creek, and Empire districts, Reveille stands pre-eminent, in the quality and quantity in sight, of its high grade silver ores. The formation is a feldspathic granite, capped over by silicious limestone, having imperfect crystallization. The veins are numerous, varying in width from three to twenty feet, and where the calcareous cap is light they are well defined and traceable for quite a distance. Their course is usually a little east of north and west of south, varying according to the contour of the surface a few points either way. As far as can be determined, from the small amount of work done on the ledges, they appear to dip easterly, with considerable regularity, at angles varying from forty-five to sixty degrees. The mineral is well diffused through the gangue of the vein, and, judging by the outcrop, the chimneys of ore are extensive as well as numerous. One or two of the most promising locations in the district, such as the Fisherman and Santa Fe, yield a very rich chloride ore of a dull, dirty color; its dinginess being due to the presence of heavy sheets of horn silver. When put into a forge, this ore sputters and boils in globules of molten silver, as a piece of fat meat would in its own grease when thrown into the fire. Assays of

almost any amount, from \$500 to \$15,000 per ton, can be obtained from this mineral; and tons of ore are in sight, without any work being done, which will mill \$1,000 to the ton. Other locations, comprising the Crescent, Highbridge, and Indian Queen, show bodies of ore, varying in width from five to twenty-five feet, which with very little assortment will yield \$200 to \$300 per ton by mill process. Rarely, if ever, have such splendid deposits of high grade mineral been seen in undeveloped mines as are now in sight on these and dozens of other newly located claims in the district. If the surface ore will only hold out to a depth of ten feet, there is sufficient pay rock available to keep several mills in full work for years to come; and, judging from the character of the formation, there is nothing to lead to the supposition that the ore will not be as good hundreds of feet down as it is on the surface. The best mines in Silver Bend district become richer as they are gone down upon, and there is reason to believe this will also be the case in Reveille.

There are no mining streams in the vicinity, but water is readily found by sinking fifteen to twenty feet; and about six miles from the mines, on a down hill grade, sufficient water for milling purposes can be obtained. Wood is plentiful six miles from the water, and will be hauled on a descending grade most of the way. With such ores as abound in the Reveille district, the disadvantages of wood and water being scarce in the vicinity of the mines will soon be surmounted, and ere another year its record in the yield of bullion will incontestably demonstrate the sterling value of its mines.

Austin, Nevada, November 15, 1866.

PROCESS OF ROASTING ORES, ETC.

Translated from the German of F. Plattner, for the Mining and Gas-Light Journal, New York.

BY J. H. TIEMANN, M. E.

NUMBER TWO.

[General remarks upon the changes which finely pulverized ores or mill products undergo, when roasted in properly constructed furnaces.]

When finely pulverized ores or mill products, consisting chiefly of sulphur metals, are roasted in a reverberatory furnace with a horizontal hearth, upon which they are spread several inches in depth, at a temperature which exactly serves to cause the sulphur and the metals in combination with it to absorb oxygen from the air passing over them, free metal-oxides, and generally sulphates are formed, while sulphurous acid is generated which has but a slight affinity for metallic bases; many arsenic metals act in a similar manner, either free oxides and oxides in combination with arsenic acid are formed, together with the generation of arsenious acid, or only oxides in combination with arsenic acid, (less frequently arsenious acid). Many sulphur metals, also, in combination or united with sulpho-arsenic metals, change to sulphates and arseniates, or to free oxides and arseniates. Under certain circumstances, antimonites appear to be formed, when, for instance, the ore to be roasted contains sulphur metals combined with antimony, or which in general contains a sulphide of antimony which, when roasted alone, as is well known, changes to a compound of antimoniac acid with the teroxide, while a portion of the teroxide passes off in the form of white vapors.

It being a condition that the air necessary for the oxidation of the sulphur and arsenic metals should have free access, it would seem at first sight to be more advantageous to have a muffle-shaped roasting furnace heated from the outside, in preference to one where a flammable fuel is used and the flame passes directly into the furnace, but upon closer investigation this is found not to be the fact.

Although in a roasting furnace of the first named description, a so-called "muffle furnace," the conditions may be fulfilled by which an oxidation of the sulphur and arsenic metals is possible, inasmuch as pure atmospheric air can be brought in contact with the ore, and the admission of a greater or less quantity is completely under control; there are three circumstances worthy of particular notice.

1. That for the proper heating of the muffle a larger amount of fuel is necessary than where the flame passes directly into the furnace.
2. That the temperature of a muffle furnace cannot be increased or diminished as desired, which is so necessary in many roasting processes, in which at certain periods a higher or lower temperature is required.
3. That the heating of the substance to be roasted is principally from the hearth, which is highly disadvantageous for many ores and mill products which sinter or smelt. The muffle furnace, therefore, is to be preferred to the ordinary flame or reverberatory furnace only in the follow-

ing cases: First, when it is desired to roast arsenic and sulphur metals, especially cobalt and nickel ores, arseniates, etc., with stone coal, and at the same time avoid impurifying with soot the resulting arsenious acid (giftmehl), metallic arsenic and suboxide of arsenic. Second, when, in roasting sulphur metals (schwefelkies, zinkblend, etc.), the resulting sulphurous acid is to be conducted into leaden chambers and there converted into sulphuric acid; though for zinkblend, which requires for its complete roasting a higher heat and longer time, the furnace is built with a double hearth, where, for the better economizing of the fuel, the gaseous products of combustion which pass under the lower hearth are allowed to pass directly into the upper one. Third, when the ores or mill products are rich in silver, and there is fear of loss in silver by volatilization by the passage of the heated products of combustion directly over the ore.

In most cases the object is obtained by using an ordinary reverberatory furnace, having a roasting space of proper light, and whose roasting surface and the open working doors, or other openings for the admission of air, bear a definite relation to the opening in the stack or chimney, and which has besides a good draught. The flame passes from the fire-box over the fire-bridge into the roasting chamber, always with some undecomposed atmospheric air, and diffuses itself at first through the whole space; but when the latter has become sufficiently heated, it ascends in waves to the arch, where the oxygen of the undecomposed air which has passed into the chamber is absorbed by the inflammable gases and carbon, making the flame illuminating, and the ore, which is spread on the hearth six or eight inches deep, is heated by the radiated warmth. At the same time air is admitted by the working doors or openings made for that purpose; this air being cold, and consequently denser than the burning gases, forces itself between the flame and the ore, causing a complete combustion of the carbon in suspension, and the still unignited gases, to carbonic acid and carburated hydrogen, thereby increasing the temperature and heating the ore more thoroughly. At the same time the temperature at the arch is increased, for the specifically light gaseous combustible products pass upwards through the gases which constitute the flame, and thus give an opportunity for other portions of the flame to become ignited, so that the flame on its way to the stack loses indeed its illuminating property, but in its stead develops new warmth. The gaseous combustible products, hydrogen and carbonic acid, which enter or are formed in the roasting chamber, pass off up the chimney in connection with the remaining undecomposed atmospheric air and the nitrous oxide-gas which has been generated, in the same ratio as new qualities are formed. If the roasting chamber is of such a height that a larger quantity of air is admitted than is necessary for the combustion of the gases and burning particles of carbon in the lower part of the flame, a part of the oxygen of the air causes an oxidation of the ore, the gaseous products or vapors thereby formed, heat being at the same time generated, pass up the chimney with the gaseous products of the fuel, the liberated nitrous oxide-gas and the remaining undecomposed air.

[To be Continued.]

THE YANKEES AHEAD.—A man-of-war regatta recently took place off Cherbourg, France, in which fifteen French boats and one American were entered. The race was for double-banked boats of all nations, pulling not more than sixteen oars, with boats from twenty-nine to thirty-five feet long. The American boat was thirty-four feet in length, with but twelve oars; all the French boats had sixteen oars each. The distance was 2,000 metres out and back. The American boat came in, amid the plaudits of both squadrons, half a ship's length ahead of all the others.

WATER SUPPLY FOR LONDON.—People who doubt the practicability of providing a water supply for San Francisco from Lake Tahoe, on account of the cost of bringing the water so great a distance, will do well to reflect for a moment upon what is now very generally considered the most feasible project for supplying the city of London with water. In addition to the immense amount of money already spent in that direction, the plan now in progress of development is to bring water from the mountains of North Wales, at a cost of from thirty-five to forty millions of dollars. The average rain fall of those mountains is larger than that in the Sierra Nevada—or about sixty inches per annum.

Mechanical.

Effect of Percussion on Iron.

Dr. Percy, in his late work on the metallurgy of iron and steel, raises an important point for discussion, with reference to a supposed deterioration in the quality of iron from the effects of percussion, which applies equally well to steel. The ideas advanced by Dr. Percy are quite at variance with the popular idea on the subject. He says it has long been a moot point with engineers, whether, under repeated light blows, or rapid vibration of machinery in action, iron becomes disintegrated and consequently brittle. This is undoubtedly the case with brass, which, when subjected to vibration, in a few weeks becomes as brittle as glass. When the frightful accident occurred on the Versailles Railway, some years since, occasioned by the breaking of a crank axle, the best men of science and practice in France were called upon to give evidence upon the point; but they were by no means agreed. The whole subject was again discussed before the Commissioners appointed by the English Parliament in 1849, to inquire into the application of iron to railway structures. Evidence was given to show that pieces of wrought iron exposed to vibration frequently break after long use, and exhibit a peculiar crystalline fracture and loss of tenacity; whilst other witnesses maintained that this peculiar structure was the result of an original fault in the process of manufacture, and that the internal constitution of the metal remained unaffected by vibration, however rapid or long continued. In opposition to the popular view as to the brittleness of iron being occasioned by vibration, Mr. Robert Stephenson pointed to the engine-beam of a Cornish engine, which received a shock equal to about fifty-five tons eight or ten times a minute, and yet went on working for twenty years without apparent change. He also referred to the connecting rod that communicates the power of the locomotive to the wheel, and receives a violent jar eight times in a second at ordinary speed, and yet remains unaffected. He pointed out that in a case of that sort a rod that has borne two hundred millions of such jars, will be found, on examination, to have retained its fibrous structure.

Where iron exhibits a crystalline appearance on breaking, Dr. Percy rightly points out that time plays a most important part in determining the character of the fracture. When the metal is broken with extreme rapidity the fracture will be crystalline; when broken slowly, it will be of a fibrous appearance. In the case of the breakage of a crank axle, we apprehend the cause to be torsion, not vibration. It was stated in evidence by a locomotive engineer, at the inquiry into the causes of the Bow accident on the Great Eastern line, that the very first turn of a crank axle begins the process of breaking; and that the final fracture—nearly always at the same place—is only a question of time. That

THE BRITTLENESS OF IRON IS INCREASED BY FROST.

Is also a prevalent notion among engineers, similar to the popular impression that bones are more brittle in winter than in summer. But the railway accidents which occur in frosty weather are more properly attributable to the circumstance that at that time the road is hard and rigid, and the engines running over it at high speeds are much more strained, and consequently more liable to accident than they are in ordinary weather, when the road is soft and yielding; just as in frosty weather we are more liable to falls, and consequently to fractured limbs, arising from the slipperiness of the roads rather than to the increased brittleness of our bones at that season. To put the matter to a practical test, however, Mr. Ramshot had a piece of rail taken up while covered with sharp frost and placed under the large steam hammer at Crewe, when it stood the blows necessary to double both ends together without showing the smallest indication of fracture. Nevertheless, the suggestion of Dr. Percy is well worthy of consideration, in which he says, "It is most desirable that the subject should be accurately investigated, and the Institution of Civil Engineers would render excellent service by conducting an elaborate inquiry into it."

NON-CONDUCTIVE STEAM PACKING.—When it is necessary to carry steam any considerable distance, the best non-conducting protections, which have been proven by experience, are to first cover the pipe with hard felt, then enclose the pipe in a box, packing the same close with spent tan, sawdust, straw or fine charcoal.

DETERIORATION IN IRON.—Attention is being called by English engineers to the asserted fact that a great deterioration is being observed in the quality of modern-made iron over that produced thirty or forty years ago. It is noted that all the earlier experimenters with iron found greater strength in ordinary qualities made at that time, than is now possessed by the very best which is made. The rails for railroads, made thirty years ago, are said to possess much more durability than those now being made. Speculations are advanced as to the probable cause of this deterioration; whether it arises from the greater rapidity in the processes of manufacture employed now, as, for example, the use of the modern "squeeze," by which the cinders and sand may be pressed into the metal, instead of being beaten out, as by the old tilt-hammer process; or from the use of the hot blast, by means of which it is found that much poorer ores can be reduced than by the cold blast; or the spirit of competition, which induces iron manufacturers to turn out the largest possible quantity at the smallest possible cost—whatever may be the cause, the fact is claimed by English engineers as patent, that the manufacture of wrought iron in Great Britain has undergone a serious deterioration during the last half century.

The only remedy suggested, is the more general application of steel for iron, since that metal can now be made so much cheaper than formerly. Few persons, even among experienced mechanics, we apprehend, are fully aware of the great difference in the character of cast iron as it comes from the furnaces.

THE MANAGEMENT OF IRON AND STEEL.—George Edes, of London, has recently published a work under the above title, which is highly spoken of as supplying a want long felt by mechanics, and all engaged in the practical manipulation and application of iron and steel. Mr. Edes, in his preface, very properly states that if young apprentices were taught to make themselves better acquainted with the materials they work upon, and for which their tools are made, as well as the proper management of these materials, the advancement of the sciences would be greatly hastened; as this knowledge would increase the powers of the head to contrive, and the hands to execute. The inventions which become publicly known, are few in comparison with those which spring up in the minds of ingenious mechanics, and perish with the hour that gave them birth, through the want of a better knowledge of the properties of the material, which they are endeavoring to call into exercise. Mr. Edes might have added, that a vast amount of labor and money might also be saved to inventors, in their investigations, from the possession of such knowledge, in the judgment that it would give them in rejecting such contrivances as are not suited to the end in view. Many an inventor has spent months of toil and study in bringing out an invention which any person, moderately well versed in mechanics, would have condemned at the start.

PLATINIZED COPPER VESSELS are being introduced into Europe, for purposes where heretofore those made entirely of platinum, have been employed. The former are said to be fully as safe and reliable for containing strong acids as the latter, and are of course very much cheaper.

TERRIBLE BOILER EXPLOSION.—An upright stationary boiler recently exploded at Pinkbead, Glasgow, Scotland. The boiler was of singular construction, somewhat resembling a huge nautical telescope, 36 feet high, 5½ feet diameter, standing upright upon its broadest end, the whole surmounted with twenty feet of large pipe. When the explosion occurred, the entire boiler and pipe was thrown perpendicular upward, a distance of 300 feet, and with so much precision that it came down with a tremendous crash directly upon its bed.

ENGLISH RIVER STEAMERS are not generally provided with engine signal bells, as is the case with American steamers; but the captain or pilot conveys his orders to the engineer by means of a boy, who is stationed at the entrance of the engine room to repeat the word.

Scientific Miscellany.

THE DISSOCIATION OF GASES.—It has recently been learned that, at very high temperatures, compound gases and their components have no action on each other. Cailletet has fully proven this, and the fact is now deserving the special attention of metallurgists, inasmuch as it may seriously affect results in furnace operations in particular. This *savant* has furnished a record of some curious experiments in this direction for the *Comptes Rendus*, which show that at very high temperatures compound gases become separated into their elements, and that at such temperatures these gases have no distinct action on each other. He heated metal in a fire of coal and wood charcoal to such a temperature that platinum was easily fusible in it. The experiment was conducted in a porcelain tube, from which the gases were afterwards collected. The analysis of these by M. Peligot gave the following result:

Oxygen	15.24
Hydrogen	1.80
Carbonic oxyd	2.10
Carbonic acid	3.60
Nitrogen	77.86
	100.00

These results proved that oxygen has no action upon hydrogen, carbon, or carbonic oxyd, in the midst of a combustible mass which is maintained at a temperature higher than that of the fusing point of platinum.

THE CONDITIONS UNDER WHICH IRON RUSTS. Few persons really understand this question or know the cause. The rusting of iron, which proceeds so rapidly when it is exposed to air, is caused by the attraction which the metal has for oxygen. It is very remarkable that iron is unable to combine with the free oxygen always in the air, but is liable to take it from water, its compound with hydrogen; for we find that in dry iron remains bright and clean for a long time, but very rapidly rusts when exposed to the joint action of air, carbonic acid gas and moisture, under which circumstances water is decomposed and oxyd of iron is formed.

ELECTRICITY IN STEAM BOILERS.—Dry steam has electric properties; when in a gaseous state it is a non-conductor of electricity. The electric discharges which may be obtained from dry steam, are supposed to attend the process of coalescence. A small steam boiler, insulated upon a glass plate, was recently exhibited for some considerable time at the Polytechnic Institution in Paris. Under a pressure of steam, continuous electric flashes were discharged from the boiler.

FIRE FROM FRICTION.—The jungles of India are often set on fire by the larger bamboos, as they are swayed by the wind, emitting fire from their hard, glossy stems through the violence of their friction, and thus spreading destruction through adjacent mountain forests. These are so extensive that the fire often continues to burn for many days together, and is suddenly extinguished by mighty deluges of rain so common in mountainous countries where water pours from clouds resembling small cataracts.

TEST PAPERS, used by chemists and others, are made by dipping sized paper into a solution of vegetable matter which will change color when subjected to the action of an acid or alkaline solution. Litmus and tumeric are most commonly used as a coloring matter—litmus for the detection of acids, and tumeric for that of alkalies. Such paper, after being dried, is cut into slips convenient for use. By dipping the appropriate test papers into any solution, we can readily ascertain whether it is acid, alkali or neutral.

ANIMALCULES.—The polishing stone obtained in Bohemia, has been computed to contain 41,000,000,000 skeletons of animalcules in each cubic inch; or 187,000,000 in each grain of weight of the slate. One of these skeletons would therefore weigh about one 187-millionth part of a grain.

At a white heat all magnetism disappears; it is still sensible in iron when heated to a dark red glow.

QUININE IN HUMAN TISSUE.—Among the novelties in organic chemistry, we may allude to the discovery of Drs. Bence Jones and Dupre of a substance resembling quinine in all the tissues of the body—resembling quinine, that is, in being precipitable by the same reagents, and in being possessed of the property of fluorescence. About the chemical composition of the substance nothing is as yet known or has been made public. The substance is obtained by first treating the animal matter with a dilute acid, then neutralizing the acid solution with an alkali, and subsequently extracting the fluorescent substance with ether. Not having as yet obtained the substance in a crystalline form, the discoverers have provisionally named it Animal Quinoidine. It deserves to be mentioned that the experiments undertaken in the course of this research showed the extreme delicacy of the fluorescence test for quinine itself. The author found that a grain of quinine dissolved in one million eight hundred parts of water showed the blue fluorescence distinctly in twenty grains of the solution.

SOME NEW COMPOUNDS OF SULPHUR AND CARBON have been obtained by O. Loew. Sesquisulphide of carbon is an amorphous brown body, which decomposes into its constituents when heated to 210° C, indicating a loose state of combination of the elements. A hydrosesquisulphide of carbon is also a brown amorphous body, having a faint odor of garlic. When this body is boiled with alkalies it gives oxalic acid and lower sulphides of carbon. By acting on a chloriac compound of hydrosesquisulphide of carbon dissolved in bisulphide of carbon, with a solution of bromine in bisulphide, the author obtained a body which appeared to be monosulphide of carbon, but found it impossible to procure the compound perfectly pure.

HOW TO OBTAIN CRYSTALLIZED CARBON.—M. Lioanet communicated to the Paris Academy a process for obtaining carbon (diamond) in a crystallized state. His plan consists in taking a long and thin gold or platinum leaf, rolling upon it a thin piece of tin foil, and putting it into a bath of sulphuret of carbon. The liquid is decomposed under the influence of the weak electric current thus excited, the sulphur combines with the tin, and the carbon is deposited in crystals at the bottom of the vessel. The author thinks diamond must be produced by nature in a similar way.

A NEW ALKALOID.—M. Hesse, in examining the red poppy for morphia, has discovered a new alkaloid, in which he has named Rhœadine, and which he says is also to be found in good opium. It is soluble in water, alcohol, and ether, crystallizing from the last in white prisms. Ammonia precipitates it as a white crystalline floculi, bichloride or mercury gives a white amorphous precipitate, and chloride of gold a yellow precipitate. Strong acids decompose it, giving it a purple solution.

AN INGENUOUS MODE of getting a correct representation of an actual battle, landscape, etc., in a panoramic form, has been suggested in Paris. The main feature is the arrangement is a revolving cylinder, with a vertical slit in it, through which the images, etc., enter, and are thrown on a photographic medium properly sensitized.

ELECTRICITY IN BLOOD, ETC.—By using delicate gold electroscopes, indications of static electricity have been obtained from living blood, nerve tissues and muscular fiber.

It has been ascertained that nitrogen in large quantities is so necessary to the life of plants that vigorous vegetation cannot take place if there is no other supply of nitrogen than the air.

In burning carbon to carbonic oxyd, a pound of oxygen generates only 2,962 units of heat; while, in burning this carbonic oxyd into carbonic acid, a pound of oxygen generates 4,258 units of heat.

The divisibility of copper is so great that a grain of it dissolved in an alkali will give a sensible color to 500,000 times its weight in water.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, November 24th, 1866.

The Money Market has exhibited no marked change since our last issue, if we may except a slight tendency to greater ease. Deposits continue to flow into Bank with more freedom, and there is evidently more capital for discount purposes than for some time past. The wants of the business community are not very urgent at present, all the facilities they require are readily obtainable at current rates of interest—1¼@1½ per cent. per month. The continued activity and buoyancy of the mining share market furnishes an outlet for the employment of considerable money, but capitalists and others are somewhat reluctant to loan upon this class of securities, except at a margin that renders the operation comparatively safe, exacting at the same time very full rates of interest—in some instances from 2 to 3 per cent. per month.

Legal Tenders have been quite active during the week, and by the very material fall of gold in New York the appreciation here has been from 2 to 3 per cent. Sales were made yesterday at 73@72½ closing at 72½ bid, and 72¾ asked.

Gold Bars quoted at 840@845, and an improvement is anticipated over these rates for next steamer purposes. Silver is selling at 1@1¼ per cent. discount.

Currency bills on the Atlantic cities are offered at 30 per cent. premium on gold. Our latest dispatches quote Gold in New York as low as 137@139, weak. Sterling 109½.

Sight Drafts, payable in coin, are selling at 2¼ per cent. premium, and Telegraphic Transfers are made at 3 per cent. premium. Bankers' Sterling, best 60 days' bills, rule at 49d; Commercial do. 49½d@50.

City Stocks are inactive. We note sales of California Steam Navigation Co. at 66@65½ per cent; Spring Valley Water Co. at 60½; and San Francisco Gas Co. at 65@64. For the Bank of California \$140 per share is asked.

The share market since Saturday has been somewhat variable and irregular. Most stocks are stronger, and have been dealt in at enhanced rates, and the general line of transactions in the Board have more or less sympathized with this appreciation. No important developments have been made during the past week, if we except the ascertainment of the continuous deposit of 100 feet of ore from the sixth to the seventh level in this Savage mine. The present activity in the market carries with it a speculative feeling, and the transactions in the Board for the week are largely in excess of a like period for a long time past.

Crown Point opened at \$900, receded to \$800, advanced to \$860, then sold at \$850@875, and at the close \$890 per foot is asked. We are informed that at the connection made by the incline at the fourth level, the ore looks very good, and that there is also some improvement in going south. During the week ending Nov. 17th, 597 tons of ore were raised from the mine; the previous week 658 tons. On the 19th inst., the mine produced 103 tons of ore.

Chollar-Potosi sold early in the week at \$225, buyer 30, then at \$200@205, declined to \$180@187.50, advanced to \$207.50, and closed at \$200. It is said that the first station drift in the new shaft reveals a body of ore 13 feet wide. Sampled lots from this drift show a large percentage of gold. At a later date, the indications in this drift, it is thought, were not so favorable. The Blue Wing station is said to look quite encouraging. It continues to carry a very large amount of low grade ores. The 700-foot station in the new

shaft has been reached, and drifting will soon be commenced. This company sent 694½ tons of ore to custom mills during the week ending Nov. 18th; the previous week 553½ tons.

Savags sold at \$1,660@1,645, jumped to \$1,710 and \$1,740, then sold at \$1,735@1,730, improved to \$1,760, and closed at \$1,775. On the sixth level, the southeast face still continues in good ore, and the upper floors are also said to be in fine ore. The second winze from the sixth to the seventh level is completed; it passed through good ore the entire distance of one hundred feet between the two stations. The seventh station produces as good average ore as is obtained in the sixth. In the south mine, Curtis' shaft, the ore is said to be more abundant than was expected, but is somewhat inferior to the quality produced where the deposit was narrower. The north drift from the same shaft is being rapidly advanced to connect with winzes No. 3 in the seventh level, the latter having gained a depth of eight feet—both drift and winze being in good ore. During the week, ending Nov. 17, this two stations in the Curtis shaft yielded 744 tons of ore, and during the same period 1,971 tons of ore were extracted from all parts of the mine, giving an approximate assay value of \$85,435—\$43.34 per ton—and leaving an estimated profit of \$47,623 after deducting all expenses.

Yellow Jacket was not dealt in to so large an extent as during the previous week, opening at \$900, buyer 30, receding to \$820, advancing to \$910, falling to \$885, gradually improving to \$935@960, and closing at \$930. The south mine, it is said, is still producing 125 tons of mill ore per day. On the 15th inst., they were 80 feet from the new level. In the north mine they have drifted about 60 feet east, and have still 80 feet to run to reach the ledge. No weekly reports have reached the office in this city since the October balance sheet was rendered, and it is difficult to gain any information in regard to the late appreciation of this stock.

Hale & Norcross continues out of the market. Some ask \$2,000 per foot. The yield of ore from this mine, it is said, is fully up to previous months, and this bullion receipts for the present month will be as large as formerly.

Gould & Curry is inactive; a few feet were sold for \$500; at the close we quote it at \$525 asked. We learn that the ore in this mine is improving in quality.

Ophir realized \$190 per foot early in the week, and then sold at \$155@160, improved to \$190@172½, receded to \$165, advanced to \$175@185, and closed at \$190. We learn nothing new in regard to the recent new developments.

Empire Mill and Mining Co. sold at \$130, and at the close \$130 is asked. The yield of bullion from this mine for the present month, it is said, will be equally as large as during the previous month.

Imperial opened at \$127, buyer 30, then sold at \$124@125, and closed at \$128. The receipts of bullion up to the 17th aggregated about \$29,000. The new shaft has attained a depth of 685 feet. It is said that the ore now extracted from the Alta mine is of a better quality.... Belcher was sold at \$110, then at \$135@125, and at the close \$125 is asked.

Confidence was in the market to a larger extent than for some time past, over 100 shares changing hands; selling at \$60, improving to \$62½@63, and closing yesterday at \$61, seller 3.... Bullion also changed hands more freely, opening at \$16, then selling at \$23, receding to \$16@17, and closing at \$17½. The publication of the delinquent list was postponed till to-day.... Overman was quite active, and over 2,000 shares were sold, opening at \$40, dropping to \$26, then selling at \$16, and closing yesterday at \$18¾. The expectations of striking the lead in the 450-foot level, have been dissipated. Work has already progressed beyond the point where it was supposed the lead would be found.

Alpha sold at \$50 per foot, and Sierra Nevada receded from \$2.62½ to \$2, and at the close \$2 is bid.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$666,461.

2 shs Yellow Jacket at 990 per foot.
 20 shs Cal Steam Nav Co at 66 per cent.
 1 shs Imperial at 124 per share.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Amador County—

From the *Ledger* of November 17th: Stuart & Cronise, at Middle Bar, crushed fifteen tons of rock from a new lode near the bar that yielded \$81.62 per ton. Pretty fair for "top rock." . . . Craft & Dane, of Pine Grove, have a very large fine quartz lode near the grove, which promises to soon make a good showing. Unaided, they have kept their work moving most of the time night and day during the past summer and fall. . . . David Fake & Co. have found some splendid prospects on the main flat at Pine Grove. The upper and lower ends of the flat were rich, but the middle portion has been unworked, in consequence of the great depth and the amount of water. Fake & Co. will erect a large whim. . . . J. F. Bradshaw has been working a claim on Negro Gulch, and often pans out from five to ten dollars per day. Hawkins & Co. have panned out as high as twenty-five dollars in a day.

At no period within the history of quartz mining in Amador, has the fall campaign opened so vigorously as at the present, and it is safe to assert that nearly, if not quite, double the work is being done than at any former time. Experience has demonstrated, what we have for the past two years labored to prove, that no business, whether for the laborer or capitalist, pays as well as quartz mining, when judiciously managed. Scores of miners in this county, as elsewhere, are to-day worth fortunes that two years ago, many of them not less than one year ago, were not considered worth a dollar. Capitalists are becoming reassured, and it is now only necessary, in this part of Amador, for the prospector to show a chance for a mine and he can readily obtain the means necessary for development.

Humboldt County—

From the *Times* of November 10th: We learn that Mr. Wentworth, the superintendent of the Union Oil company, has all the machinery of the Jeffrey company on the ground of the former, and that it will be set up and ready to commence operations early the next week. The Irwin Davis well is down something over thirteen hundred feet.

Kern County—

From the *Havilah Courier* of November 17th: A run of six days on the Joe Walker gave a return of \$12,000. . . . We have the figures to show that the mines of Kern county recently yielded, in six days, the sum of \$200,566. . . . Long Primmer Hall has sold no interest in his mine for a good price.

Calaveras County—

From the *San Andreas Register* of Nov. 17th: A Mexican has struck the celebrated "Fairplay" lead, as it comes out on Indian Creek. The rock is full of fine gold, visible to the naked eye, and the lead is as wide as where it was originally discovered, over five feet. Several of our townsmen have been fortunate enough to get interests therein. . . . Mr. William Irvine has got his mill in successful operation at El Dorado. A gentleman who was there informs us that Mr. I. has struck it enormously rich. Upwards of two thousand dollars were raised in one blast.

Colonel Bowman, proprietor of the celebrated Pink Smith lead, located on the South fork of the Mokelumne river, near Mosquito Gulch, in Calaveras County, has recently disposed of it for \$50,000 in gold coin. A large mill will be immediately erected on the lead by the gentleman who purchased it.

Contra Costa County—

From the *Contra Costa Gazette* of Nov. 17th: We have been shown a sample of very good coal from the Pacheco coal mine, which is located, as we understand, about a mile west of Clayton. The width of the vein is said to be six feet on the outcrop. The company have run a tunnel about ninety feet, striking the vein only thirty feet below the outcrop, where they find it four feet wide, and of the quality shown. The promise of this vein is very satisfactory.

El Dorado County—

The Placerville correspondent of the *Alta*, writing under date of Nov. 17th, confirms the reports of the rich strike in the Woodside mine. He says: The mass or slab of gold mentioned in your telegram has not been taken out. It stands there, nevertheless, a monument to helie the oft-repeated assertion that our "mines have given out." In order to take this mass of gold out intact, the company are sinking down eight or ten feet, and will block it out whole if possible. The depth of the shaft now is 125 feet.

The parties who have purchased the Pacific mine have contracted to go down 300 feet, ledge or no ledge, and the work is being driven night and day.

The same writer says that several cement or gravel claims in the vicinity are yielding

largely. "So far the results have been astonishing, inasmuch as heretofore this sort of stuff has not been considered of much account. I can say with safety that there are acres of this belt unclaimed and open to location; working interests are freely offered by parties who have not sufficient means to properly work their claims."

A correspondent of the *Sacramento Union*, writing from Georgetown, Nov. 12th, also confirms the newspaper accounts of the Woodside mine.

Nevada County—

From the *Gazette* of November 17th: The Boston Ravine ledge has been lying idle until quite recently, when the owners commenced sinking an incline. At the depth of forty feet they struck water in such quantities as to render it difficult to proceed with the work, and have suspended operations for the present. The ledge is very regular, being about eighteen inches in width, the rock containing free gold and sulphurets. The quality of the ore rapidly improved with the depth reached on the ledge.

From same of 19th: A company of Germans are working a quartz ledge at Wood's Ravine, by sluicing. The quartz rock, together with as much of the censing as it is necessary to take out in running tunnels and drifts, is dumped on a pile, from whence it is shoveled into sluices. A large quantity is already out, and will be washed up as soon as they can obtain water. The rock is mostly decomposed, and the ledge is spotted, paying largely in some places and but little gold being found in others.

Craig & Co., whose diggings are situated on Oustemah Hill, expect to begin washing gravel to-day—having out already about a thousand tons to commence on. The diggings are drained by a bedrock tunnel, and the gravel is hoisted to the surface by a whim, through a double shaft. The gravel prospects finely, and the owners have the best reason to anticipate a rich reward for their energy and perseverance.

Same of 20th: Eureka township has already become of considerable importance. Last year there was but one quartz mill in the township, that of the Jeffersonian company, near Bowman's; but four new mills have been put up during the present season, two of which are completed and the other two nearly so. The Lamborn mill has recently been leased to the owners of the Liberty ledge, who are making arrangements to put it in operation. The mill of Hunt, Curtis and others, erected on the Jim ledge, is nearly completed; so also is the mill erected by Puttee on the Grizzly ledge. In addition to these, an arastra mill has just been erected by Booth & Co. In the Glenbrook mine, the rock thus far crushed has mostly come from the upper drifts, and these only furnish enough to keep the mill running about half the time, and is got out at considerable disadvantage. In the course of a few weeks they expect to be able to keep the mill running constantly. The principal office of the Jeffersonian company has been removed to San Francisco.

Same of 21st: At the Cornish mine and mill they have been carrying on operations vigorously, and have out now some fifty or sixty tons of as fine looking sulphuret ore as we ever saw. This was all taken out in running the tunnel. In some of the ore free gold is visible, but its richness mainly consists of the sulphurets. The ledge is from three to four feet in width, and the entire vein rock is saved for crushing. The mill is run by water power, has six stamps, and will crush about ten tons in twenty-four hours. They will commence crushing in the course of a week or two, by which time they will have enough rock on hand, with what can be taken out, to keep the mill running steadily.

From the *Grass Valley Union* of November 17th: We are informed, through a reliable source, that the Illinois and Wisconsin Consolidated mine, near this place, is now turning out ore which will average \$250 per ton. The quartz is not what would generally be called specimen rock, but it is well filled with fine gold. This is one of the old mines of Grass Valley, which for years was under a cloud of litigation.

A correspondent of the *Transcript* states that many of the miners are returning to the "old camping ground" at Rush Creek, and are now engaged in developing the quartz ledges of that locality. In the past few weeks seven or eight promising ledges have been located, among them the Great Eastern, Vanderbilt, Essex, Shakspeare, Rough Diamond, Excelsior and Golden Eagle, all of which show most encouraging prospects. The Golden Eagle is located about a quarter of a mile from Chapman's ranch.

Excelsior. — The *Transcript* of the 14th instant says: We are informed by a gentleman who came down from Meadow Lake district on Monday, that a large number of people will winter in the new district, and a number of companies will work through the winter. The Excelsior mill is kept in constant operation and the rock is yielding well. A new mill is

being erected near the Excelsior, which it is expected will soon be ready to start. The Grant mill has been stopped for a few days, to enable the owners to put in a permanent flume in place of the temporary structure through which they have been running water. The mine is yielding handsomely, and the mill will start up again on next Monday. During the last storm, snow fell to the depth of eighteen inches at Meadow Lake.

Placer County—

The *Stars and Stripes* of Nov. 21st, says: An extensive formation of conglomerate or "pudding stone," exists at a point on the railroad above Alta, and a number of claims have been located on either side of the road. Gold is found in the formation, enough, it is thought, to pay for crushing. It has been pretty thoroughly prospected.

From the *Dutch Flat Enquirer* of Nov. 27th: We learn that there is a project on foot by some of our business men to make up a joint stock company to prospect for the blue lead, in this vicinity. Those who have taken the initiative step in this matter appear confident that the project is entirely a feasible one, and that the rich leads which have been worked with so much profit in our neighboring towns of Little York, You Bet and Red Dog in Nevada county, have a continuation in the claims here. They propose, as a prospecting operation alone, to form a joint stock company of twenty shareholders, with a paid up capital stock of two thousand dollars, or one hundred dollars each, by this means they will be enabled to ascertain beyond a doubt whether the blue cement exists in such quantities as will pay or not.

Plumas County—

Nelson Point correspondence of the *Marysville Appeal*, of Nov. 16th, has the following: Most of the companies on Nelson Creek were flooded out. It was a very sudden rise; the water came rushing over dams, leaping into holes and filling them up, suspending all work. Some of the companies were able to get in again with two or three days extra work; others have given it up and taken out their flumes. Murkin & Co., when the water drove them out, had a piece of ground stripped down to the high points of bed rock, on which the gravel prospected \$1.50 to the pan. They have been trying for the past week to get the water out, but have given it up. The flood at Nelson, coming all at once, has been attributed to the breaking away of a Chinese dam some six or seven miles above.

Shasta County—

From the *Courier* of Nov. 17th: W. H. Gooch informs us that the miners on Dog Creek are making active preparations for mining during the coming winter, and he anticipates a prosperous season for both miners and traders in that locality. . . . There will be more men at work on Mad Ox the coming winter than for several years past. Several new claims will be opened and thoroughly prospected by experienced miners. A nugget of gold, weighing twenty-two ounces, was found on this stream last week.

An effort is being made to form a company for the purpose of fluming Town Creek, near Pittsburg, which is known to contain rich gold deposits. The creek has never been mined much heretofore, on account of the heavy character of the diggings, but several fortunes have been taken from its bed in early days.

Sierra County—

From the *Downieville Messenger*, of Nov. 17th:—The town is alive with speculators and prospectors, daily bringing in rich specimens of ores from newly discovered lodes. We hear of several sales this week at advanced figures. Our Recorder appears to be doing a lively business; nearly ten miles of quartz lodes have been recorded thus far this month. . . . We have been shown a rich piece of ore from a newly discovered lode on the East Fork, two and one-half miles above town.

At Alleghany, the Union mill is the only one that is running at present. They anticipate a rich clean-up. The other mills have only stopped running for the present, while they are in search of more rock.

La Porte letter to the same, says:—All the talk now is of the "Big Thousands," which will be taken out the coming water season by Conly & Co., to say nothing of the smaller gravel banks in this vicinity.

The "Downieville Mining Company," reported in the Atlantic States as having failed, is not, as might have been supposed, in Sierra county. The *Messenger* says it is at Meadow Lake, Nevada county.

The *Nevada Gazette* never heard of such a mine, and thinks it never had existence, "except in the imaginations of confiding stockholders."

The same paper speaks of the comparative cost of working large veins, with nit levels and water power, and thin veins, with shafts and steam power. The writer takes, as two representative counties, Sierra and Nevada; and as the representative mine of Sierra, the Sierra Buttes mine. The following are the

items: Power from 8 to 25 feet, worked by nit levels, with inexhaustible backs; water power for propulsion in abundance; number of hands employed, 40; average wages, \$55 for 26 days, \$2,200; hoard, \$4 per week, \$594; candles, \$26; iron, steel, and coal, \$20; powder and fuse, \$70; shoes and dies (over estimate), \$400; extra for mill and other expenses, \$200; total expenses for 26 days, \$3,510. Crushing capacity, 26 days, 780 tons. Cost of quarrying and crushing, per ton, \$4.50. Against this he asks Grass Valley men to give facts and figures for some representative mine in that region of comparatively thin veins, worked by shafts and steam power.

Siskiyou County—

From the *Yreka Union* of Nov. 17th: The proprietors of the Siskiyou quartz lead, situated on Humboldt, are in a happy state of mind over the most flattering prospects for a fortune. A few days ago, at the bottom of their new shaft, they found the ledge to average three feet and a half in width, and containing the richest rock ever taken from any claim in this vicinity.

Tulare County—

From the *Times* of Nov. 17th: A gentleman has shown us some quartz which he says was obtained in the hills near town. The appearance was good. He pulverized some, that with a glass showed a large percentage of gold, much of which could be seen with the naked eye.

Yuba County—

A correspondent of the *Mountain Democrat* writing from Brownsville, November 6th, says: In July last, Talloch and others from Amador county discovered and opened a rich lode of gold-bearing quartz. They erected an 8-stamp mill upon it, and commenced crushing a fortnight ago, and in a run of less than twelve days got forty pounds of amalgam for their labor, valued between \$3,500 and \$4,000! There are a number of other claims here supposed to be equally rich.

The Brown's Valley miners, at their annual meeting, resolved that ten dollars' worth of work and improvements performed on each and every claim of 150 feet, annually, in order to hold the same, in addition to the annual representation, and that a sworn certificate of said work or improvements must be recorded with the mining recorder of the district; and that unless such certificate be recorded that said work has been done, then such claim or claims shall be forfeited. The owner of every 150 feet in such claim not worked, is required to perform on or before the 1st of January next labor to the amount of \$10.

NEVADA.

Washoe—

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Gold Hill News* of Nov. 13th: Mining stocks are gradually on the rise. All the mills from the mouth of Six-Mile Cañon to Washoe, and from Washoe to the extreme limits of Ormsby and Lyon counties, are employed. The old worn out mills are being rebuilt, and the capacity of many of our first-class mills being increased. Every day we see large wagons loaded with mill machinery on our streets, while all the teams in the whole country find constant employment in hauling quartz. Hundreds of miners who have been in outside districts during the summer, have, within the past month, returned to this county, and all who desired it have found employment at good wages. In short, we do not hesitate to say that times are more prosperous at the present time in the State of Nevada than they have been since 1863.

From the *Enterprise* of 16th: The Imperial and Empire Companies of Gold Hill, have received a portion of their new machinery, which will be erected at the new shaft, which is now down 700 feet. It is now the intention of the superintendent to commence drifting at the depth of 900 feet. All the machinery will be on the ground in a few days.

Reese River—

From the *Revelle* of Nov. 10th: Work will be immediately resumed in the Beal North Star mine, by Capt. Phillips, just returned from the East.

The Murphy mine, at Twin river, is yielding ore fully up to the expectations of the most sanguine. We are informed that seventy-one tons were reduced at the mill with the average yield of \$185.55 per ton, producing the handsome sum of \$13,174.05.

Same of 11th: In Hot Creek district, the erection of a light 10-stamp mill by the Consolidated Silver Mining Company of New York, is giving an impetus to work as well as trade. Mr. Gould, the agent of the company, has been successful in securing a good mill site, and is pushing on the building operations with great dispatch. . . . The "Old Joe" and "Old Jake," new locations, are deserving of notice. The former will be opened during the winter. The prospects of the district are very encouraging.

The same of the 15th, gives an account of a trip to Silver Peak district. We quote a paragraph: "The citizens of Belmont seem impressed that it will soon be a large city, and in that faith are living in great disregard of present comfort. To see men, ragged and dirty to the last degree, sleeping, cooking, and eating in the open air, without protection from the wind and dust, and coddling over their specimens and talking of hundreds of thousands, is interesting."

An editorial in same issue refers to the incredulity with which the *American Journal of Mining* receives the stories of large ledges and rich rock, which have from time to time been told by the *Reveille*. The article closes thus: "Our duty is to make statements of what we know, and if these are discredited we can do no more. We have lately published discoveries of the most astounding character made in the southeastern portion of the State; but these, although some of them are producing a great deal of interest, attract but little attention other than in our own neighborhood. Yet we do not despair. The great wealth of the country is an incontrovertible fact, and whether attracting the attention of capital or not at present, the day is very near at hand when those so cautious now will look back at our exertions with regrets at their incredulity, and that will be our reward."

[See communication in to-day's issue, confirmatory of these large stories.—Eps. Press.]

The Nye County *News* of Nov. 10th, says of Hat Creek district: "This district is about 110 miles southeast of Austin, and about 90 miles east of Lone. Already there is a good wagon road from Austin to the mines, and a stage running weekly, carrying passengers and mail. The ledges, as a general thing, are large and well-defined, showing much native and horn silver. As an instance, how little capable a man is to judge of the quality and richness of ores, a lot of four tons—two of first and two of second class—taken from the Gazelle mine, worked in a mill at Austin, first class over \$300 per ton, and second class over \$400 per ton. The second class, looking more barren, contained a greater proportion of native horn silver, and less of coloring of sulphurets. There are many claims in this district of the same character and quality of quartz that we find in the Gazelle, for instance, the Old Joe, Old Dominion, Indian Jim, Keystone, Oro, and many others, all large and well-defined, assays from some of these claims ranging as high as \$22,000 per ton. The facilities for mills in this district are good, there being wood and water in abundance, the principal mines being easy of access, cañons large, so that wagons can be run up and down without moving a rock or grading. A mill, I am informed, will soon be taken down at Austin, and put up at Rattlesnake Springs, about six miles south of the Hot Creek mill, for doing custom work, and when spring opens, I apprehend that the Hot Creek country will show some of the richest silver mines and busiest mining camps in the State."

Esmeralda--

T. W. Abraham writes to the Nye County *News* as follows: "I have just returned from a trip of three weeks to the new gold mines between East and West Walker rivers, in Esmeralda county. I shall go back in a few days and stop through the winter. The mines of which I speak are wonderfully encouraging, being gold-bearing quartz lodes of good width and well-defined. Enough has already been discovered to give great hopes of permanency and future success."

Humboldt--

From the *Register* of Nov. 10th: Oreana is lively. The furnaces were not in blast when we were there—were undergoing repairs; but were fired up Monday, and are turning out plenty of bullion. The new building, for the large and improved furnaces, is going up as rapidly as the carpenters can do the work. Coarse bullion stands in high stacks all about the mill, and finer bullion in large quantities in adjacent boxes. The refining has not yet kept pace with the smelting, and no shipments till next week.

Pahrump--

A number of miners will winter in this district. One mill has been completed, and two others are to be put up immediately. The prospects are reported to be good for business in the spring.

IDAHO.

From the Idaho City *World* of Nov. 3d: Judge Hough brings us mining news from the northern part of the State. Warren's diggings is one of the liveliest mining camps on the coast. There are about 500 men at work about there, and the claims generally pay very handsomely. New and rich discoveries are being frequently made in that locality.

The quartz interest is promising very favorably in Northern Idaho. Several ledges discovered about Warren's diggings, and in the Elk Creek country, prospect richly. A quartz mill will be put up in the spring.

From same of 10th: In Alturas, the Wad-

diagham mill is running. The Benson mill will run a short time. The other mills will likely remain idle during the winter. Two or three arrastras have made some money this fall—among them one working Ada Elmore rock. Rucky Bar is still the principal mining camp of that country. Red Warrior is about deserted.

The Enterprise Tunnel Company have contracted with a party of miners to run 300 feet of their tunnel at \$4 per foot. The work is to be commenced immediately from the Moro's Creek side of East Hill, and when completed will be about 150 feet below the level of East Hill Tunnel, which is now 350 feet in length.

MONTANA.

From the *Post* of Nov. 3d: The best statements regarding Rochester gulch are repeated in our presence every day. In the basin, which is nearly three miles square, the ground from the surface to a depth of four feet yields from three to five cents to the pan. There has been no snow there during the present season. The distance from Virginia City to the mines is about forty-two miles.

On the Kennett lode, near Slade creek, five miles from Virginia City, a shaft has been sunk to the depth of the original lode, and another of twenty-five feet upon the extension. The rock resembles that of the celebrated Ore Cacho in its appearance, and every fragment contains free gold in the form of thin scales. . . . Some prospectors belonging to Helena, discovered in the Mengher county, a rich copper lead, which they named the "Green Clay Smith Lode." There are traces of gold and silver in the rock.

COLORADO.

From the *Journal* of October 30th: Mr. Fletcher came down from Montgomery the other day. We hear it said that Captain Plummer has made a small shipment from his new mill—thirty-six ounces. The Buckskin people are emigrating to a large extent for the winter. Mr. Napheys tells us that the snow fell there on the 15th and 16th to a measured depth of fifty-eight inches. . . . The Bobtail mine is at last drained, and among others the Barstow company will soon resume work. They will doubtless sell their first-class ore, as will also the Seneader company, to Lyon & Co., for seventy-five dollars per ton. As selected, the Bobtail ore contains from fifteen to twenty per cent. of copper.

Mr. Fish is cleaning out the old 70-foot shaft, and preparing to mine the Davenport, in Gregory Gulch, above Mountain City. . . . The mining camp of Tarryall has shipped, by express, from twelve to fifteen pounds of gold per week since last spring. One bank claim, working three men, has yielded regularly over a pound of gold per week.

Mr. C. S. Stowell has run out about 60 cwt. of metal from his Argentine mines, its value estimated at \$200 per ton. It is to be shipped East in its present shape, and run through the lead oxidizer in Portland, Me., parties running the machine there wishing to try their hands at cupelling with their patent oxidizer. In the trial made by Mr. Stowell, silver at the rate of sixty-eight ounces per ton of litharge was found in the litharge.

Mr. Solomon Robeson, for two summers prospecting in the Medicine Bow mountains, returned a few days since, and from him we gather that there is a mining district of considerable extent, about two hundred miles northwest from Denver, and fifty southeast of Fort Halleck. The best gulch found varies in width from three hundred to six hundred yards, is generally about ten feet to the bedrock, has enough fall to ground sluice, and runs an abundance of water. The surface prospects just about enough to pay for running off. Deeper and on the bedrock it prospects ten cents to the pan. The party examined the gulch pretty thoroughly for fifteen miles in length, and found it very even.

Editorial correspondence from Montgomery has these items: The El Dorado has a shaft more than 100 feet in depth. The Ogden also has a deep shaft with an engine house upon it—engine and hoisting house in good repair and looked up. The Harrington and Washington look precisely as they did a year ago. Some Eastern companies have been organized upon them, but have as yet seen no cause for doing anything. At the Parsonage, the upper adit, starting 300 feet in altitude from the top of the hill, has been driven 160 feet. Thirty or forty cords of quartz and ore lie at the mouth.

On the Susquehanna, 700 feet east from the German lode discovery, Mr. Morgan has sunk the old shaft thirty feet deeper. Some very good ore was taken out. At Mr. Klein's shaft, just above the Susquehanna mine, very fine looking ore is seen. Three wagon-loads of the ore, run in Holbrook's stamp mill, gave 11 ozs., 16 dwts.,—at the rate of about fourteen ounces to the cord. Ryan & Co. are buying the best quality of Klein's ore. The gold averages \$17.93 to the ounce.

The Consolidated Gregory mine lies idle. Lyon & Co. having expended \$130,000 upon it,

and got it into good condition, are waiting for the other stockholders to pay their portion of the expense incurred.

In the Gregory No. 2, the Black Hawk company have, within a week, struck the finest vein of ore they have had for three or four years—four to five feet in width and pure and rich. At Keith's we are told that the Smith & Parmelee company have paid the mill \$20,000 within about six or eight weeks. DuBois is getting well under way, and Col. Tannatt is gradually warming up his furnace preparatory to starting. Mr. Fitzpatrick is doing better than before for a year, and his monthly average, for about fourteen months, has been as high as 500 ounces. The Smith & Parmelee and the Ophir are getting the finest and the richest ores they ever had. The Congdon have the largest pile of ore in the Territory, a mine second to none in character, are clear of debt and with money in the treasury, stockholders jubilant, and stock selling for three times as high a figure as that at which it was originally placed in the market in the feverish stock excitement of 1864.

From the Denver *News* of October 31st: The reports from Ward mining district are very flattering, and promise great things for the future. The Ni-Wot mining company are now taking out twelve hundred dollars in gold every day. The Columbian lode, upon which the Ni-Wot mill is situated, has been discovered lately to have a crinoid of solid ore sixty-two feet in width. The ore yields two hundred and eighty dollars to the cord, is soft quartz containing free gold, easily saved by the ordinary process.

ARIZONA.

From the Los Angeles *News*: The mining interests of the Territory are looking up. At Williams' Fork the Great Central company have completed their extensive smelting furnace, and ten tons of copper had been smelted. All the mines at Williams' Fork are doing well; the ore now being obtained from the different companies will hereafter be smelted on the ground. The only company now shipping ore is the Placet, and that company will smelt their ore as soon as they have finished shipping what they have already on the banks of the river.

Mr. Ravena, on a recent trip from Prescott to La Paz, brought down a gold bar weighing two hundred ounces; the result of a run of Captain Bogart's mill, at Prescott.

Mr. Ravena is still prosecuting the work of developing his gold mine, having run a drift twenty-two hundred feet; the lode is now laid bare for a distance of nine hundred feet, and varies from nine to twenty-one feet in width. This mine is pronounced very rich, an abundance of wood and water is close at hand, and it is situated only six miles from La Paz.

OREGON.

The Idaho *World* of Nov. 10th, says: New diggings are reported on the banks of the Umatilla river, a mile or two back of Umatilla Landing.

UTAH.

From the *Vedette* of Nov. 8th: We were yesterday shown a certificate of an assay made by Messrs. Bohm & Molitor, of ore from the "Ballion" lode, No. 3, in Bingham Cañon, which takes the lead of all yet found. Messrs. Bottsford, Skidmore & Co. are the proprietors of this rich discovery. The following is the assay: Gold, oz. 216.27, value, \$1470.67; Silver, oz. 160.35, value, \$207.35; total value, \$1678.02. Who now can doubt the existence of great wealth in this Territory.

BRITISH COLUMBIA.

From the British *Colonist* of November 8th: Passengers from Big Bend report that the Fort Yale company, on McCullough Creek, have struck pay at a depth of seventy feet. Also, that a company adjoining the Fort Yale have got dirt that prospects two dollars to every three paces.

Reports came into Fisherville that on the other side of the Rocky Mountains, four days' travel from Kootenay, new gold diggings had been discovered by Kootenay miners who were on their way to Saskatchewan, and that companies there were making sixty ounces per day.

Rains had caused a cessation of mining operations in several of the more populous and favorite localities, and claims were being laid over for the season. Reports of new discoveries, some of unusual value, continued to be received, but their truth cannot be verified until next spring.

The Cariboo *Sentinel*, of October 29th, publishes the following statement of the amount of gold produced in the district of Cariboo, for the season ending on that date: Exported by the Bank of British Columbia from the 7th of May to the 29th of October, \$518,710.52; Bank of British North America, \$452,220.58; amount exported by merchants, packers, miners, etc., \$100,000—total, \$1,070,931.10. This is exclusive of the amounts lodged in the banks on special deposit, and is said to be a low estimate.

Metallurgy.

To Copper Miners and Others Interested in the Working of Copper Ores.

THE UNDERSIGNED HAVING BEEN APPOINTED Agent and Attorney by S. Baskett, for the sale of his COPPER SMELTING FURNACE, which has proved a perfect success, is prepared to furnish the same to parties having Copper Ore, or will make arrangements to buy their Ore, receivable at their mines. For further particulars, apply to JOHN N. KISDORF, 21v12 At Coffey & Kisdorff's, San Francisco.

MARTIN & CO.,

Office, Stevenson House,
Corner California and Montgomery streets (up stairs).

WILL CONTRACT FOR THE
PURCHASE OF COPPER ORES.
Assaying eight per cent. and upwards of Copper to the ton. We will make advances upon Ores of Copper. San Francisco, Post Office Box 1259. 22

EUROPEAN

METALLURGICAL WORKS,

—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of ore adapted to the smelting process attended to. Sulphuric, pyrites, and the so-called "rebellious ores," are having special attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL,

J. E. MURPHY.

JOHN TAYLOR & CO.

IMPORTERS,
AND DEALERS IN

ASSAYERS' MATERIALS,

Druggists' & Chemists' Glassware,
Photographic Stock, Etc.

512 and 514 Washington Street,
SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,

And from France and Germany, as well as the Eastern States, PURCHASERS, CHEMISTS, MECHANICAL BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such appliances as are necessary in the development of the mineral wealth of this coast.

A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' Sundries, Acids and Chemicals, constantly on hand. San Francisco March 6, 1865 11v10-1f

Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, efficient and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 14v15-1m

GEORGE H. POWERS, M. D.,

Gives exclusive attention to

Diseases of the Eye.

No. 626 California street, between Dupont and Kearny.

Dr. Powers refers, by permission, to Rev. A. L. Stone, D.D., Ira F. Rankin, Esq., L. E. Bencley, Esq. 17v13-6m

For Sale—Cheap.

A GOOD PAYING BUSINESS, TOGETHER WITH THE good will of the party, controlling the entire trade of this city and State. It is suitable to any intelligent business man, and has averaged about \$800 per month. It is now offered low, solely because the proprietor is compelled to leave the city. Address "S. H.," Lock Box 602 Post Office, or inquire at S. W. HOWLAND'S, No. 24 California street. San Francisco. 17v15-1m

Just Published.

THE PHILOSOPHY OF MARRIAGE, BEING FOUR IMPORTANT LECTURES ON FUNCTIONS AND DISORDERS OF THE Nervous System and Reproductive Organs, to be had by addressing and inclosing twenty-five cents, postage stamps, to Secretary PACIFIC MUSEUM OF ANATOMY, Montgomery street, San Francisco. 12v13-1y

ELECTROTYPING CUTS, ENGRAVINGS, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

Canyassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

San Francisco:

Saturday Morning, Nov. 24, 1866.

NOTICES TO CORRESPONDENTS.

STAR GAZER.—The somewhat sneering observations made by many contemporaries at the non-occurrence of the anticipated meteoric shower of the 12th, 13th and 14th instants, can only be accepted as indications of their lack of science and wit. The soundness of the prediction that a great meteoric shower might be expected tri-centennially, at nearly equal spaces of time between each appearance, cannot be invalidated, because we in the United States failed to observe such during the current month. When the spaces traversed by the earth and the meteors, during a third of a century, are taken into consideration and contrasted with the, in comparison, almost infinitely small area occupied by the North American Continent, it cannot be a matter of surprise that the periodic shower of meteors should, on the present occasion, happen to be more visible in some other point of the earth, than the North American Continent. Phenomena of the character under notice are almost annually observed in Mexico, Central and the northern part of South America, at this period of the year, whilst they are only faintly, and often not at all visible, at other parts of the earth. As an illustrative instance, may be mentioned a very splendid meteoric shower, seen in England in the year 1837, while a most attentive and skillful observer at Braunsberg, in Prussia, saw on the same night, which was there perfectly clear, only a few sporadic shooting stars fall between seven o'clock in the evening and sunrise the next morning. From this fact, Bessel concluded that a dense group of aerolites, composing a great ring, may have reached that part of the earth in which England is situated, while the more eastern districts of the earth might be passing at the time through a part of the meteoric ring proportionally less densely studded with these bodies. A telegram from Greenwich announces that the meteoric shower was visible at that observatory, much more numerous and brilliant than is generally seen in ordinary years. It ought not to be forgotten, also, that a distinguished astronomer calculated that the unusually brilliant periodic shower which ordinarily takes place about the expiration of every third of a century, will not become due until November, 1867. In a few months we shall probably be in possession of information respecting the meteoric appearances presented by the heavens over the greater part of the earth, during the nights of the 12th, 13th and 14th, of this month. When all these data are collected, we shall perhaps be able to judge more understandingly.

S. M.—ARTIFICIAL MAGNETS OR LOAD-STONES, may be prepared in several ways, the easiest manner and the most powerful, are made by a method first proposed by Mr. John Mercer, a talented chemist residing at Manchester, England, the recipe of which is as follows: "Take a quantity, say one pound of the common crystallized protosulphate of iron, dissolve it in water, and add nitric acid in sufficient quantity to peroxidize it, and afterwards expel carefully all excess of nitric or nitrous acid by boiling. To this add one pound of protosulphate of iron, with water sufficient for its solution. Pour the mixture into a solution of caustic potash sufficient in quantity and strength to decompose the whole, and then boil. The precipitate thus thrown down consists of a mechanical mixture of the protoxyd and peroxyd of iron atom to atom; raise the temperature of the mixture to 212° Fahrenheit, and their chemical union is effected. That such is the succession of changes, is proved by dipping into the mixture previous to boiling it, a piece of cotton cloth, which, after exposure to the air for four minutes and washing in water, exhibits the buff stain peculiar to peroxyd of iron precipitated upon cotton fiber. But if this is performed after the boiling, a dirty black stain is obtained, indicating the formation of the black oxyd."

This fact is further proved by the oxyd, after boiling, having a crystalline structure, when examined under the microscope; the minute plates having a brown color and being transparent, although the edges of the crystals are not sufficiently defined to trace the form. The application of the artificial magnetic oxyd of iron, either in a dry or moist state suspended in water, has been recommended as a substance well adapted, from the extreme susceptibility of magnetic influence, to indicate the direction of magnetic or galvanic currents, the magnetic curve described by Dr. Brewster being beautifully exemplified by the use of this oxyd.

THE ANGULAR PADDLE WHEEL.

Considerable interest has been manifested in this city, for the past year or more, among steamboat men, with regard to what is known as the Jones & McComb Angular Paddle Wheel. The design of this invention is to do away with loss of effective power, necessarily involved in the working of the common paddle wheel—an object which has been long but ineffectually sought for, by mechanical contrivances, for "feathering" the floats of the common wheels as they revolve. The float devised by the gentlemen named, is set across the face of the wheel, at an angle with the line of the shaft, and is so twisted or warped, that every inch thereof, from one end to the other, is perpendicular to the center of the shaft, a condition which cannot be obtained from the straight angular floats which have heretofore been tried. By this arrangement there is neither blow or impact as the wheel strikes the water, nor pressing down as it goes in, nor lifting up as it comes out; but the floats have a uniform and constant heering against a solid body of water, precisely like an oar in sculling.

The theoretical result is a greater economy in the application of power, less slip, a total absence of the vibrating action due to the "heating" or impact of the ordinary wheel (so unpleasant to passengers and injurious to boat and machinery), and the capacity of an almost unlimited speed at which the wheel may be run.

The mechanical effects of impact are well understood, as is also the great loss of power thus involved in the motion of the ordinary steamboat wheel. By the impact of a hammer, actuated by the hand, we may drive a nail which a ton weight of power will not start. The philosophy involved is a multiplication of the velocity of the falling body into its weight, which is taken up by the object struck. In the case of the paddle-wheel, that force is taken up by the water and lost, so far as propulsion is concerned. The amount of that force may be imagined by the effect it exerts upon the boat, and just that amount, together with the subsequent pressing and lifting, must be saved by the angular or feathering paddle. Competent engineers have calculated that the saving of power, as above, will allow of an increase in the periphery of the angular over the ordinary wheel, of fully twenty-five per cent., without any increase of power being required to give the wheel the same number of revolutions. When to this is added the capacity which these wheels possess for almost unlimited increase of revolution, with their acknowledged decrease of slip, it may well be inferred that the speed of a boat driven thereby need be limited only by the strength of its construction.

The ordinary wheel can be run at a speed under which propulsion will almost cease, as the force of the wheel will be chiefly exerted against a falling column of water, while this wheel may be run at any attainable speed, greater even than that admissible in the submerged propeller; as whatever the speed, the floats must be constantly pressing outwards or inwards, according as they are set, against a volume of undisturbed water.

So much for theory. The first practical trials of this wheel were made in a Whitehall boat, driven by hand. Careful estimates are claimed to have been made, which showed that in these hard trials the "slip" of the angular wheel was only three per cent.; while the slip of a model wheel of the same size, constructed after the ordinary manner, was twenty-five per cent. It should be borne in mind that in these trials the angular wheel was constructed exactly after the manner which experiment had shown was required for an accurate development of the principle, while in the subsequent trials on board the S. M. Whipple, this proper construction was so far departed from as to allow the slip of the angular wheel to fall back to nearly the same as that noticed in the ordinary wheel.

The principle of the angular wheel requires fourteen floats for such wheels as those upon the S. M. Whipple; but the frame work of her wheels was such as required the use of either

ten or twelve floats. Four trials were made with that boat—the first with her usual wheels; the second with ten angular floats; the third with twenty, throwing this water outwards, and the fourth with twenty floats, throwing it inwards. These trips were made to Red Island and back, and in each case, so far as possible, under equal conditions of tide, wind, and pressure of steam. The result was a slight gain for the new wheels of about fifteen minutes in the total time of running—a little short of two hours—with about the same amount of slip. No appreciable difference of speed was noticed between the third and fourth trials; but when the floats were set so as to throw the water inward, the boat did not mind her rudder so well as when they were set the other way, and more power was required at the wheel than with ordinary wheels. On the first trip, when throwing the water outward, she moved forward in a straight line for upwards of thirty minutes without the wheel being either moved or held in place, except by the headway of the boat. All the trials were made under about sixty-seven pounds of steam pressure.

The last results are considered as highly encouraging, considering the unfavorable conditions under which they were made; and it may reasonably be expected that when a trial is made, with a wheel constructed in perfect accordance with the principle involved, results will be obtained closely approximating the theoretic deductions derivable therefrom. The practical deductions from the results already obtained, after making reasonable allowances for unfavorable conditions, would seem to indicate an effective saving in the angular wheel of from one-sixth to one-fourth of the power required to perform the same amount of propulsion with the old wheel. We hope soon to be enabled to give a mathematical demonstration, showing the precise theoretic difference, in obtainable results, between the application of power to the angular and common wheel. We also understand that a properly constructed angular wheel is to be put upon the Alameda boat, at an early day, such as will give an effectual and practical solution to this interesting problem.

THE ÆTNA IRON WORKS.—Messrs. Hanscom & Co., proprietors of the above named works, have their hands full of business. Among other matters at present in hand, are the furnishing the iron works for the front of the Fireman's Fund Insurance building, on the corner of California and Sansome streets; a "monitor," or miner's hydraulic distributing chest, for W. V. Clark of Mokelumns Hill; a sawmill for Thos. S. Farmer of Santa Cruz; machinery for a cotton mill, for Mr. Curry, to go to Mexico; machinery for Martin Myrick's coffee and spice mill, San Francisco. By the last Oregon steamer they forwarded an 18-inch Tyler water wheel to order. They have castings to make also for petroleum stoves, the demand for which seems to be increasing. A large amount of miscellaneous work in their line is being constantly turned out at these works.

Mr. Smith, of this firm, has the agency for Dunbar's Piston Packing Rings, which are being extensively introduced on this coast. A set of these rings recently manufactured by Messrs. Hanscom & Co., for the McKee Plantation, Sandwich Islands, was spoken of in the highest terms in a recent letter to the firm, and the mechanical execution of the work was especially praised.

These gentlemen opened the Ætina works during the last spring. Through judicious advertising and faithful attention to business, they have secured a good share of patronage throughout the entire season. We congratulate them upon their success.

A deposit of peroxyd of manganese, which it is thought will prove valuable, was struck on the 21st inst., near the Mission Dolores, by workmen who were blasting rock.

THE LARGEST TUNNEL in the world is known as the Box Tunnel, on the Great Western Railway, in England. This tunnel is 9,680 feet long, 30 feet high, and 35 feet wide.

J. ROSS BROWNE'S REPORT.

The report of J. Ross Browne, Government Commissioner for collecting mining statistics on this coast, was forwarded to Washington by the last steamer. Although intended merely as a preliminary report, it fills about 500 manuscript pages, containing a large mass of valuable statistics. It would have been, of course, impossible for any one man to have collected in person all these items, in the course of the two months which have elapsed since the appointment. Mr. B. secured the services of experts, and by a judicious division of labor, managed to have the thing done expeditiously and effectually.

The report is in ten sections. The first relates to the history of gold and silver mining on this coast, from its inception to the present time. The second to the geology of the gold and silver belts, together with the processes for the reduction of ores; prepared chiefly by gentlemen connected with the State Geological Survey, especially for Mr. Browne. The third section describes the present condition of the mining interest, with statistics of representative mines. The fourth relates especially to the State of Nevada. The fifth is devoted to copper, and is especially complete; giving, as it does, what may be denominated an exhaustive paper on that subject, as regards this coast. Quicksilver furnishes the matter of the sixth section. The seventh refers to the borax, sulphur, tin and coal resources of California. The eighth section sketches the legislation of different governments in reference to mineral lands, and the late action of the United States Government on the same subject. The ninth shows the manner in which the local mining laws vary from each other in different districts, and urges the propriety of a uniform system in all. The tenth and last section, gives a list of the most important works that have been published in reference to the mining interests on this coast.

This report undoubtedly presents the substance of the facts that have been, up to this time, collected on the subject to which it relates, in the most complete, and at the same time succinct form possible. The effect will no doubt be seen in the more intelligent legislation on these matters, which is likely to be the result. But as the subject cannot be exhausted while the mining interest exists as the chief one on this coast, the commission should be a permanent one; and without doubt our National Legislature will see this necessity of a further appropriation, in order that it should be made such, inasmuch as it is only by that means that the mining interest can be properly represented and advocated at the National Capital.

THE recent rich strike in the Woodeide quartz ledge, near Georgetown, at the depth of 125 feet, has waked up the people in that vicinity to the fact that the reason their mines have been under a cloud, is simply that they have not been sunk upon to a sufficient depth. They assert there is not a shaft in El Dorado county which is 200 feet deep; and that of six quartz mines in that region which were owned by San Francisco parties, the average depth is only fifty feet. Yet these six mines were all abandoned as worthless, although mills had been put upon three of them, and two furnished rock which yielded \$15 and \$25 per ton! Several claim owners have set themselves to work in earnest, to sink at least 300 feet.

It is doubtful, after all, whether a section of the Big Tree will be sent to the Paris Exposition. It is ascertained by calculation that a section one foot in length, would weigh eighteen tons; and that one three inches in length, would weigh three and a half tons! The cost of laying it down in this city would be about one thousand dollars.

WORLD'S FAIR COMMITTEE.—Dr. J. B. D. Pigne Dupuytren, Professor Wm. P. Blake and Alvina Maynard have been appointed by the Chamber of Commerce a Special Committee to represent them at the World's Fair at Paris next year.

THE BUENA VISTA OIL COMPANY.

The property of this company, which consists of a claim of ten quarter sections, is located near Buena Vista Lake in Tulare county, and was the first location for petroleum made in that region. The company was organized about two years ago; but little was done, however, until last summer, during which a refinery was put up on the company's ground, with a capacity for refining about 250 gallons per day. The works are now in operation under the immediate charge of Mr. Sleeper, late of Columbia.

Mr. J. O. Lovejoy, President of the company, called upon us on Thursday last, and left upon our table a package each of the illuminating and lubricating oils produced at these works, which appears to be of as good a quality as any imported. This oil has been quite extensively used in Mariposa county for some time past, and, as we learn from the Mariposa Gazette, gives most perfect satisfaction. Five hundred gallons of burning fluid and lubricating oil was received in Mariposa, a few days since, for local consumption there; and it is expected that the company will be able to produce from this time on, from 5,000 to 7,000 gallons each month. The dealers in that portion of the State will be supplied directly from the works, and the surplus will be sent to this city.

A shipment of forty-eight casks was received here on Tuesday last, per schooner Joseph Wadley, via San Luis Obispo, to which port it is transported on wagons, a distance of seventy miles from the works. Reddington & Co., of this city, will act as agents for the sale of the oil.

The company's supply of crude oil is derived, for the present, from a single pit about twenty-seven feet deep, and 6x8 in size, cribbed up. About 300 gallons of crude oil can be pumped from this pit every morning; the supply being replaced by percolation from the surrounding gravel during the balance of the day and night. The crude oil yields, by practical working, as follows:

	per cent.
Burning Fluid	45
Lubricating Oil	45
Residue, (mostly Carbon)	20
Total	100

The density of the oil as it comes from the pit, is from 20° to 25°. The residue from the still is used for fuel, for conducting the process of distillation, and for other purposes; but a small portion of the amount, however, is required. Mr. Lovejoy informs us that there is a belt of ground, from two to three miles in width, extending for a distance of thirty or forty miles, parallel with the coast range, throughout the whole extent of which, at intervals, oil indications may be found. The most promising portions of this strip of country has been located as petroleum grounds. The large cost of transportation at the present prices of oil, will but little more than cover the expenses of manufacturing and delivering the same in this city. The profit of the company now at work is mainly derived from the local sales in that portion of the State. There can be little doubt, however, that should the contemplated railroad to the southern portion of the State be constructed, a most lucrative business in this line would speedily grow up. The successful experiment of the Buena Vista company, and the companies operating in Santa Barbara county, have given a practical demonstration that that portion of California is capable, not only of producing oil enough for home consumption; but can also, by going deeper, and otherwise extending the field of operations, furnish an almost unlimited supply for shipment to foreign markets.

Mr. A. HAYWARD, who has been appointed one of the California Commissioners to the Paris Exposition, has prepared a block of quartz from his own well-known mine in Amador, which he will take with him. It is from a depth of 1,250 feet, and weighs seventy-seven pounds.

A USEFUL ARTICLE.—Dr. Boynton's Medicine Chest. See advertisement in to-day's paper.

HENDY'S NEW CONCENTRATOR.

[Will soon be illustrated.]

Hendy's Latest Improved Concentrator, for Gold and Silver Ores, With Revolving Stirrers and Rotary Distributor.

(As described in the MINING AND SCIENTIFIC PRESS, November 17th, 1866), can be seen at H. J. Booth & Co's, Union Foundry, First street, corner of Mission. For further particulars, send for a Circular. Address

J. HENDY,

403 Montgomery Street, San Francisco.

N. B.—The proprietor is prepared to furnish these Machines on thirty days trial, to responsible parties.

SILURIAN FORMATIONS IN NEVADA.—At the recent meeting of the Academy of Natural Sciences of California, Prof. Whitney stated that a collection of silurian fossils had recently been sent in by Dr. Blatchley, of Nevada, and that they were sufficient to show that the lower silurian formations were developed in Nevada about one hundred miles southeast of Austin. Fossils, specifically identical with those found in the Niagara, Chazy and Trenton groups in New York, are abundant. They appear to be similarly grouped, and are remarkably like the New York fossils. Corals and trilobites are numerous and are very well preserved. These fossils show that there was deep water in that region in the silurian period, and that the rocks are contemporaneous with those which form the larger part of the State of New York. This, the Professor said, completed the whole series of geological formations on this coast.

Prof. Blake remarked that Dr. Newberry, in his exploration of the Colorado River, had seen and reported what he considered to be lower silurian rocks resting upon the granite at the base of the cañon of the Colorado, and that the cañon gave a complete section of the geological formation from the base of the silurian to the tertiary inclusive. Other observations made in that region, had led Prof. Blake to the opinion that we not only had rocks there of silurian age, but a region of rocks still more ancient or pre-silurian, which probably had formed a shore or island, around which the silurian rocks were deposited, as in the State of New York.

NITRO-GLYCERINE.—An advertisement appears in our columns to-day from Messrs. Bandmann, Neilson & Co., the agents for the sale of Nobel's Patent Blasting Oil, or Nitro-Glycerine. Next week we shall publish a letter from that firm, giving a brief history of their connection with this article, and its present position before the public.

A MILL for the manufacture of all kinds of knit goods, has just been completed at the corner of Folsom and Eagle streets, in this city. The machinery is of the best construction, and is already on the ground. An engine of 100-horse power will be the motor.

With the first steamer of the China line, which will sail on the first of January next, will go the first number of Marriott's new journal, entitled the "Californian China Mail and Flying Dragon." It is to be printed in Chinese and English.

Air Pump for Sale.—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JOHN ROACH, mathematical instrument maker, 622 Montgomery street. 21v13-3p

DR. A. HARTMAN,

Electro-Magnetic Physician,

CURES ALL CURABLE DISEASES, BY THE CONCENTRATION OF THE VITAL FORCES. Nature's own method of cure. The blind made to see, the deaf to hear, the lame made to walk, and the sick healed. Come and see the afflicted at the rooms. They will speak for themselves. The poor treated free from 10 to 11 A.M. and 4 to 5 P.M. Operating rooms, Cream House, 523 Kearny street, between Sacramento and California. 21v13m

THE MINING AND SCIENTIFIC PRESS, published weekly, in San Francisco, California, by Dewey & Co., is one of the oldest and most valuable papers published in the "Golden City." Mining is its specialty, but it is full of a variety of scientific and valuable information. Subscription price is only \$5 a year. —[Philadelphia Mining News.]

To Miners and Families Living in the Country.

DR. BOYNTON'S MEDICINE CHEST, is put up in San Francisco expressly for the use of families, and consists of a chest of moderate dimensions, neat in its appearance, containing those household articles, simple remedies, that families always feel like keeping on hand for immediate and common use, and a book of brief instructions, describing their use.

The object in preparing this Chest was not to make doctors, but for the simple purpose of nursing; hence, a majority of the remedies are such as are familiar to nearly all who are advanced in life, and the book is simply a representation of those plain truths relating to the department of the nurse already set forth in more extensive works. It was the object, not to say many things, but to say few things—to simplify and make plain for common use. And in selecting the contents of the Chest, the object was not to set forth something new and wonderful, but those of old and well-known worth.

In view of the above facts, physicians have everywhere encouraged the circulation of this chest in unqualified terms. They recognize the fact that families do not, will not, need call on them on the occasion of every slight derangement or infirmity. They do not and cannot deny the fact that such obligations of home care rest upon heads of families.

The book gives a description of nearly every medicine in the collection, their use, and their component parts, so that every person may know what he is receiving into his stomach or applying to his person. This openness and frankness is regarded by the best practitioners, and all considerate persons as just, more than policy. The universal conviction of the more thoughtful is, that that which relates to our health and physical well-being in this life should, above all things, be known, and not kept in the darkness of secrecy.

In introducing this chest in the country, we always first submit it to the criticism of practicing physicians, and feeling the importance and acing the necessity in this sparsely settled country of home-nursing, and seeing the adaptability of this chest, physicians in San Francisco, Sacramento, Stockton, Knight's Landing, Cacheville, Marysville, Colusa, Oroville, Lincoln, Polson, and Auburn, have given it their hearty sanction. Seeing the necessity on this coast of people relying upon themselves in such matters, physicians in this State have remarked: "If I could choose but one for a family, I would every time choose the nurse instead of the physician." "If families would get a collection of simple remedies, with plain instructions for their use, they would do away with half the doctoring." "All families should possess themselves of a collection of common remedies, with plain instructions for their use." "I would like to see the chest in every family."—"It is a convenience."—"It is useful."—"much sickness and much expense might be saved by such home care."

We subjoin the following statistics from Sutter County, California:

"The undersigned have had Dr. Boynton's Medicine Chest in their families for the last few months, and willingly state that they regard it as a wise provision, strictly practical and highly useful."

Every person having the chest in the above named county has signed the above article. The publishing of the names being unnecessary, we withhold them and save space.

The undersigned have known Dr. Boynton's Medicine Chest for the last few months, and regard it as a wise provision, and highly useful in every family. The medicines being put up with instructions, its utility, convenience, and great economy are unquestionable.

Signed by Judge HUNNERT and 45 others.

STATE OF CALIFORNIA,) ss.

County of Sutter,)

I, C. E. WILCOXEN, County Clerk in and for said County, hereby certify that I am personally acquainted with a majority of the individuals whose names are subscribed to the foregoing certificates, and that they are good and substantial citizens of said county.

Witness my hand and official seal this 27th day of

December, A. D. 1865.

C. E. WILCOXEN, County Clerk.

Agents wanted in every County to sell this Family Chest.

Their compensation will be a liberal commission on all sales.

The Agent should be a resident of the district which he is to canvass, and accompany his application with good references, and of this city if possible.

We can give further particulars when desired.

All letters should be addressed through the post office, to

E. NORRIS,

NITRO GLYCERINE.

Nobel's Patent Blasting Oil!

WE ARE NOW PREPARED TO SELL NOBEL'S PATENT Nitro-Glycerine. The same is stored with Mr. C. S. SWENSON, at Michigan Bluff, Placer county, from where the oil has to be received by purchasers.

Application to be made to Mr. C. S. Swenson, or to the undersigned.

IGNITERS AND CARTRIDGES!

For sale at the same place.

Mr. Swenson is willing, if desired, to show purchasers the mode of blasting, either at his own mine, Michigan Bluff, or at the places of purchasers.

Pamphlets, with minute instructions, will be presented to every purchaser or applicant.

BANDMANN, NIELSON & Co.,

21v13 210 Front street, San Francisco.

The Mining Press has entered upon its thirteenth volume. It is a valuable publication in its sphere, and its sphere is a large and important one. —[Marysville Appeal.]

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Frater's concentrators, Wakley's pans, Boers' pan, Germain Barrels, Arastar Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Stralight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL ROBIN TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Eike at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

THE "FREEZE OUT" GAME.—The Shasta
Courier of Nov. 10th, has an editorial on this
subject, a portion of which we copy: "We
have ever opposed the plan of applying to capi-
talists for means to open our mines. Either
sell or have nothing to do with the moneyed
mao. On other terms than as a purchaser let
him aloof, for the moment you enter into co-
partnership with him you have undertaken the
task of playing with edged tools without being
wounded."

In the South Fork district capitalists have
undertaken to open two lodes—the Chicago
and Big Central. What is the result? They
have done work enough to satisfy themselves
of its richness, without going far enough to
admit of the work paying. Orders were then
given to suspend work. Capital will proceed
no farther until the whole thing is placed in
its hauds, on its own terms; and poverty, dis-
gust, or some other potent cause will induce
owners to part with what, under favorable cir-
cumstances, would be a fortune, for a soog, and
sing it themselves.

San Francisco capital is too much concen-
trated. There is lack of competition, for the
reason that it is so easy to combine and consoli-
date all the capital held for mining purposes;
hence, our miners owning rich quartz claims
can only protect themselves by combining, and
jointly work to develop their mines so as to
attract capital from the Atlantic side and from
Europe. They must adopt the system of "help
one another," or the concentrated capital of
the mining sharps of San Francisco will play
them out—completely freeze them out!"

GOLD IN THE COAST RANGE.—The Healds-
burg Standard has the following:

Considerable excitement was manifested in
town on Monday and Tuesday, about the re-
ported discovery of a rich quartz ledge above
here, on Russian river. We are informed that,
at the depth of forty or fifty feet, a ledge was
struck, and so rich that particles of gold could
be seen through it. That there are small
deposits of gold in the Coast Range is un-
doubtedly true, but further than this we are
skeptical.

ing accounts of new discoveries in gold, silver and cop-
per, and should be taken by every person that wishes to
keep well posted on the developments of our State and the
Territories.—[Mountain Messenger.]

WHY A PIANO JINGLES.—Mr. Wilde, a piano maker and tuner in Washington city, has discovered the reason why a piano sometimes emits jingling sounds, as if some screw was loose inside, or some of the strings were loose and jarred together. Mr. Wilde insists that it is something in the room, and not the piano, that produces the jingling. A pane of glass will be found loose, and its key note in exact unison with the piano note. Whenever this note is struck the glass sounds, in accordance with the sympathetic law of acoustic vibration. Sometimes a clock that has run down produces the jingle.

GASTON'S AMALGAMATING PAN.—The Nevada Gazette of Nov. 10th, says of this pan: "It has been in operation at Stiles' mill for the past three weeks. Quite a number of practical millmen have examined it since it was started in operation, all of whom express a favorable opinion of it, and it is adapted for working either gold or silver ores. The motion of the 'screw' is such as to keep all the pulp in constant action, and bring it in regular order under the millers. In amalgamating, the rate of the speed is slackened and the motion reversed.

Bell's Assay Office.

THE UNDERSIGNED, HAVING FORMED A COPARTNERSHIP this day, would inform the former patrons and the public generally, that they will continue the ASSAY BUSINESS in all of its branches, at the old stand,

No. 512 California street,

One door west of Montgomery, San Francisco, with the same employees, under the name of Rogers & Brown.
MR. EDWARD WOLLER, for the last seven years Assayer for Mr. Bell, will have charge of the Assay Department.

The Melting Department will be under the charge of MR. HENRY J. FISHER, for ten years in the United States Mint in this city and Philadelphia, and for the past seven years with Mr. Bell.

We would inform Photographers that we are prepared to work their chloride of silver and ashes from their paper clippings.

We have, in connection with our Assay business a MILL, and are prepared to

WORK GOLD AND SILVER ORES,
In quantities from 25 to 500 pounds; also, Assayers' Sweeps.

**GEORGE E. ROGERS,
H. W. BROWN.**
October 13, 1866. 18V13 41p1r

Work.—We would specially call the attention of MILL
owners and Engineers to our superior PARAFFINE OIL,
which we manufacture from the California Petroleum.
This Oil will not gum. Machinery thoroughly cleaned and
lubricated with it will not heat, and after remaining at rest,
can be started without cleaning off.

A sample can of our Paraffine Oil will be forwarded
on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

An elegant and complete assortment on hand. 4V13 3m1r
414 Front street, San Francisco.

THE MINING PRESS is particularly the miners' Journal,
and is doing more for the solid interests of the State than
any other, by enabling its readers to unlock the mines of
untold wealth which lie waste around them.—[Mountain
Messenger.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call special attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY.

Rheumatism!!

ANOTHER WITNESS!

SALMON FALLS, June 17, 1866.
H. BOWMAN—DEAR SIR: HAVING HAD A FAIR
test of the virtues of RICHARDS' REMEDY FOR RHEU-
MATISM, I take great pleasure in stating that its effects were
completely recovered, the use of my limbs, which had be-
come almost powerless, so much so that I could not dress
myself without assistance. Since that time I have been
free from Rheumatism. I have recommended RICHARDS'
Remedy to numerous friends, and in every case it has proved
successful. I therefore take great pleasure in recommending
it to all who are afflicted with Rheumatism, and espe-
cially to all mercurial chronic Rheumatism cases.
Yours respectfully,
(Signed) ERASTUS PARSONS,
President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento.
Price, \$2.50 per Bottle. 11V13

Important to Californians.—Many inventors have
lately had their claims for Patents seriously (and in some
cases fatally) delayed by the unqualification of agents who
have not complied with the Government license and revenue
laws, as well as other new and imperative regulations.
These discrepancies, although arising from the inexperience
of honest agents, are none the less dangerous to applicants
for patents, whose safest course is to trust their business
with none but active and experienced solicitors. The MIN-
ING AND SCIENTIFIC PRESS PATENT AGENCY has strictly com-
plied with the regulations of the Department, and properly
filed all necessary papers as Class Agents.

Pacific Law and Collection Office

—OF—
W. H. ALLEN,

Attorney and Counsellor at Law,

ments, Artificial Limbs, etc., are manufactured and applied
by himself.
He has no connection with any Agency. 8V13-4V11p

BROWN & BEADLE,

Offer their services to

INVENTORS AND THEIR ASSIGNEES,

—AS—

PATENT SOLICITORS.

They will make Preliminary Examinations in the Patent
Office, with a view to ascertain the Patentability of any
invention that may be submitted to them for that purpose;
will prepare the necessary papers for those who wish to
make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as Attorneys in presenting Ap-
plications at the Patent Office, and in managing them to a
final issue; will draw up Assignments; will examine into
the condition of Rejected Applications when desired to do
so, and undertake the prosecution of such as may be con-
sidered patentable, and do whatever else is usually done by
Patent Solicitors.

Address, P. O. Box 257, Washington, D.C. 7V12-3m

Our Circulation.—THE MINING AND SCIENTIFIC PRESS
has a large and permanent subscription list, and enjoys a
more universal circulation among stockholders and per-
sons directly interested in mining than any other paper on
this coast.

CONNECTICUT

Mutual Life Insurance Co.

The Largest Life Insurance Com-
pany in the World.

ASSETS.....\$12,000,000.

THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE
Insurance Company in the world, and it has

The Largest Number of Members,
The Largest Amount Insured,
The Largest Surplus,
The Largest Business,
The Largest Income,

And as it obtains the LARGEST average rate of interest on
its investments, and has had, through its whole history, the
SMALLEST average expenses, it therefore affords in-
surance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy
Holders during the current year is SIXTY PER CENT. of the
premiums paid during the year ending 31st of January,
1867.

Insurance can be effected in this Company in all the
forms desired, and to meet all the contingencies to which
Life Insurance is applicable, among which forms are—

Whole Life Policies, by a continued annual life
premium.

Whole Life Policies, by TEN annual premiums.

Endowment Policies, by a continued annual
premium.

Endowment Policies, by a limited annual pre-
mium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age
stipulated.

ALL POLICIES issued by this Company are either non-
forfeitable by their terms, or may be converted into those
which are so, at the option of the insured.

The Company offers all the advantages of a CASH or
NOTE Company. The insured are not required to give a
note in part payment of the premium, but may, if pre-
ferred, pay the first four premiums in cash after which their
dividends on Annual Premium Life, and Continued Pre-
mium Endowment Policies, will, if the past success of the
Company is continued, reduce their premiums one-half.
When notes are given for Annual Life and Continued En-
dowment Premiums, no notes will be required after the
fourth payment, and to return surplus-dividends—
will be applied as cash to the reduction of the annual
premium.

None but Unexceptional Risks Accepted; and
only upon ages between Fourteen and Sixty.

DIRECTORS:

JAMES GOODWIN, HENRY C. ROBINSON,
GEORGE S. GILMAN, GUY R. PHELPS,
MARCUS S. HOLMES, R. D. HEFANY,

Accidental Insurance!

The Accidental Insurance Company
OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF
all kinds, and death resulting from accident.
In case death does not result from the injury, the insured
receives a weekly compensation as long as he is disabled
(not to exceed twenty-six weeks).

ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensa-
tion of \$5.
\$10 will buy Policy for \$2,000, with weekly compensa-
tion of \$10.
\$50 will buy Policy for \$10,000, with weekly compensa-
tion of \$50.

SHORT TERM POLICIES.

Policies will also be issued for any other amounts within
the limits before stated, for periods of one to six months,
at rates in tens of the Annual rate, as follows:

1 month, 2-10.	4 months, 5-10.
2 " 3-10.	5 " 6-10.
3 " 4-10.	6 " 7-10.

GENERAL ACCIDENT TICKETS.

This Company also issues Tickets, which are sold by
many of its Agents at Hotels and Ticket Offices through-
out the country.

They make Insurance for \$5,000, and \$25 per week com-
pensation, against Accidents of every description, Traveling
or otherwise; good for one to six days, as required, at
TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which
cover only injury or death, the result of an "Accident to
the Public" conveyance in which the assured may at the
time be traveling, but they are GENERAL ACCIDENT
TICKETS.

SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and
other Ports. Rates varying with the season, and the voy-
age to be taken. Information can be had of the Company
or its Agents.

The Company has a PAID UP CASH CAPITAL OF
\$250,000. One hundred thousand dollars deposited with
Wm. BARRETT, Esq., Superintendent of the Insurance Depart-
ment of the State of New York, and the remainder securely
invested in Stocks in the hands of the Company.

INDUCEMENTS.

The rates of Premium are very low.

The Plan is so simple that any one can comprehend all
its workings.

No Medical EXAMINATION is required, and those who
have been rejected by Life Companies, in consequence of
hereditary or other diseases, can effect Insurance in this
Company at a very small cost.

No better or more satisfactory use can be made of so
small a sum.

For Policies or further information, apply to

patched for CHINA on TUESDAY, January 1, 1887.
For passage and all other information, apply at the Pa-
cific Mail Steamship Co's office, corner of Sacramento and
Leidsdorff streets.

OLIVER ELDRIDGE, Agent.
Delays are Dangerous.—Inventors on the Pacific
Coast should bear in mind that by patronizing our Patent
Agency they can sign all necessary papers for securing pa-
tents almost immediately, thereby avoiding the three
months' delay requisite in transacting business through
Eastern agencies.
Postage.—The postage on the Mining and Scientific
Press to any portion of the United States is twenty cents per
annum, or five cents per quarter, payable in advance at the
Post Office delivering the paper. Postage free in the city
and county. Foreign postage (with few exceptions) two
cents per copy, prepaid. To Bremen and the German
States (marked via Bremen and Hamburg line), three cents
per copy, prepaid. Single copies to any address in the United
States, two cents.

New Mining Advertisements.

Hope Gravel Mining Company. Location of
Works and Property: Grass Valley, Nevada County,
California.
Notice is hereby given, that at a meeting of the Board of
Trustees of said Company, held on the fifteenth day of
November, 1886, an assessment (No. 11) of one dollar per
share was levied upon the capital stock of said Company,
payable on the seventeenth day of November, 1886, in gold
coin of the United States, to pay to the Secretary, at the
office of the Company, No. 623 Clay street, San Fran-
cisco, Cal.
Any stock upon which said assessment shall remain un-
paid on Saturday, the twenty-ninth day of December, 1886,
shall be deemed delinquent, and will be duly advertised for
sale at public auction, and unless payment shall be made
before, will be sold on Monday, the eleventh day of Janu-
ary, 1887, to pay the delinquent assessment, together with
costs of advertising and expenses of sale. By order of the
Board of Trustees.
DAVID WILDER, Secretary.

D. P. Richards.....280 50 5 00
And in accordance with law, and an order of the Board of
Trustees, made on the eighteenth day of October, 1886, so
many shares of each parcel of said stock as may be neces-
sary, will be sold at public auction, at the auction rooms of
Maurice Dore & Co., 327 Montgomery street, San Francisco,
Cal., on Monday, the tenth day of December, 1886, at the hour
of 12 o'clock, P. M., of said day, to pay said delinquent as-
sessment thereon, together with costs of advertising and ex-
penses of sale.
C. HEYWOOD, Secretary.
Office, 311 Market street, San Francisco, Cal. n024

Pacific Coal Mining Company, Contra Costa
County, near Antioch.
Notice is hereby given, that at a meeting of the Board of
Trustees of said Company, held on the twenty-third day of
November, 1886, an assessment of five dollars (\$5) per share
was levied upon the capital stock of said Company, pay-
able immediately, in United States gold and silver coin,
to the Secretary, at his office, Nos. 623 and 630 Clay street,
San Francisco.
Any stock upon which said assessment shall remain un-
paid on Monday, the twenty-third day of December, 1886,
shall be deemed delinquent, and will be duly advertised for sale
at public auction, and unless payment shall be made before,
will be sold on Monday, the twenty-first day of January, 1887,
to pay the delinquent assessment, together with costs of
advertising and expenses of sale. By order of the Board of
Trustees.
A. DURAND, Secretary.
Office, Nos. 623 & 630 Clay street, San Francisco. nov 24

Providence Gold and Silver Mining Company,

Nevada County, California.
Notice.—There are delinquent, upon the following de-
scribed stock, on account of assessment levied on the
eighteenth day of October, 1886, the several amounts set
opposite the names of the respective shareholders, as
follows:

And in accordance with law, and an order of the Board
of Trustees, made on the eighteenth day of October, 1886,
so many shares of each parcel of said stock as may be ne-
cessary, will be sold at public auction, by Olney & Co., No.
418 Montgomery street, San Francisco, Cal., on the eighth
day of December, 1886, at the hour of 12 o'clock P. M. of
said day, to pay said delinquent assessment thereon, together
with costs of advertising and expenses of sale.
J. M. BUFFINGTON, Secretary.
Office, No. 10 Government House, San Francisco. nov24

Mining Notices--Continued.

Adella Gold Mining Company, Rock Creek,
Sierra County, California.
Notice is hereby given, that at a meeting of the Board of
Trustees of said Company, held on the nineteenth day of
October, 1886, an assessment of one (\$1) dollar per share
was levied upon the capital stock of said Company, pay-
able immediately, in gold coin, to the Secretary, at 410
Market street, San Francisco, Cal.
Any stock upon which said assessment shall remain un-
paid on Saturday, the fourth day of November, 1886, shall
be deemed delinquent, and will be duly advertised for sale
at public auction, and if payment is not made before,
will be sold on Saturday, the fifteenth day of December,
1886, to pay the delinquent assessment, together with costs
of advertising and expenses of sale. By order of the Board
of Trustees.
A. C. TAYLOR, Secretary.
Office, 410 Market street, San Francisco, Cal. o037

Arbitros Mining Company, Batopilas Dis-
trict, State of Chihuahua, Mexico.
Notice is hereby given, that at a meeting of the Board of
Trustees of said Company, held on the thirty-first day of
October, 1886, an assessment (No. 12) of one dollar and a
half (\$1.50) per share was levied upon the assessable capital
stock of said Company, payable immediately, in United
States gold and silver coin, to the Secretary, at his office,
No. 811 Montgomery street, up-stairs, San Francisco, Cal.
Any stock upon which said assessment shall remain un-
paid on the fourth day of December, 1886, shall be deemed
delinquent, and will be duly advertised for sale at public auc-
tion, and unless payment shall be made before, will be sold
on Saturday, the twenty-seventh day of December, 1886,
to pay the delinquent assessment, together with costs of ad-
vertising and expenses of sale. By order of the Board of
Trustees.
A. MARTINON, Secretary.
Office, 811 Montgomery street, San Francisco, Cal.
N. B.—Until further notice, all advertisements of this
Company will appear in the Mining and Scientific
Press. n03

Chilpanco Mining Company--District of Ures,
Sonora, Mexico.
Notice is hereby given, that at a meeting of the Board of
Trustees of said Company, held on the thirty-first day of
October, 1886, an assessment of five (\$5) dollars per share
was levied upon the capital stock of said Company, pay-
able immediately, in United States gold and silver coin, to
the Secretary, at his office, No. 318 California street, up-
stairs, San Francisco, Cal.
Any stock upon which said assessment shall remain un-
paid on the first day of December, 1886, shall be deemed
delinquent, and will be duly advertised for sale at public auc-
tion, and unless payment shall be made before, will be sold
on Monday, the seventh day of December, 1886,
to pay the delinquent assessment, together with costs of ad-
vertising and expenses of sale. By order of the Board of
Trustees.
JOHN F. LOHSE, Secretary.
Office, 318 California street, Up-stairs, San Francisco, Cal.
n03

Chapparral Hill Gold and Silver Mining Com-
pany, Albany Flat or Hill District, Calaveras County,
California.
Notice is hereby given, that at a meeting of the Board of
Trustees of said Company, held on the seventh day of
November, 1886, an assessment of fifteen cents (15) per share
was levied upon the capital stock of said Company, pay-
able on the fifteenth day of November, 1886, in United States
gold and silver coin, to the Secretary, A. DE SENALLHAC,
at the Company's office, 606 Montgomery street, San Fran-
cisco, Cal.
Any stock upon which said assessment shall remain un-
paid on the tenth day of December, 1886, shall be deemed
delinquent, and will be duly advertised for sale at public auc-
tion, and unless payment shall be made before, will be sold
on Monday, the thirty-first day of December, 1886, to pay
the delinquent assessment, together with costs of advertis-
ing and expenses of sale. By order of the Board of Trust-
ees.
A. DE SENALLHAC, Secretary.
Office, 606 Montgomery street, San Francisco. n010

Colorado Silver and Copper Mining Company.
Notice.—The Annual Meeting of the stockholders of the
Colorado Silver and Copper Mining Company, will be held at
the Company's office, No. 623 Clay street, San Francisco,
on MONDAY, December 24th, 1886, at 3 o'clock P. M., for the
election of Trustees, and the transaction of such other bus-
iness as may properly come before it.
n010-4w B. W. MUDGE, Secretary.

Del Norte Comstock Company, Low Divide
District, Del Norte County, California.
Notice is hereby given, that the Annual Meeting of the
shareholders of the above named Company will be held on
MONDAY, the third day of December, 1886, at 7 1/2 o'clock
P. M., at the office of the Company, No. 331 Montgomery
street, San Francisco, for the election of Trustees to serve
the ensuing year, and for the transaction of other business.
R. N. VAN BRUNT, Secretary.
San Francisco, November 15, 1886. n010

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,
San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 3,000 inches of water, and from 4 feet to 300 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to KNAPP & GRANT, -ALSO- San Francisco.

Leffel's Lever Jacks, For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by KNAPP & GRANT, San Francisco, 1212-3m.

Notice to Miners, Well-Borers and Water Companies.

M PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,
8v13-1y Store Store, No. 125 Clay street, below Davis.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

IMPORTANT

WORKERS OF GOLD & SILVER ORES.

THOSE INTERESTED WILL FIND IT TO THEIR ADVANTAGE to call on MR. WILLIAM SLOSSON, at Prof. W. P. Blake's Office, and obtain a Business Circular, just published by the WURTZ AMALGAMATION COMPANY of New York, who have secured, under the Patents of Prof. Henry Wurtz, the sole and exclusive right to the use of sodium in amalgamation. Mr. Slosson is prepared to supply the licenses of the Company, with the material for applying this new and wonderful discovery, by which, in the words of President Barnard, of Columbia College, "two grains of gold may be gathered where but one was before." 19v13-2m

Brevities.

THEY are using nitro glycerine again in Massachusetts for blasting purposes.

FRANCE, Italy, Belgium, and Switzerland have united to regulate the weight, title, form and circulation of their gold and silver coins.

EIGHTEEN inches of snow fell on the 5th November at the Summit crossing of the Big Tree road between Murphy's and Silver Mountain.

THE Ohio vine growers are becoming satisfied that the culture of the grape in that region is a failure. The land is being gradually given up to corn and grain.

THE work on the great dam in the American river at Folsom, belonging to the Natoma Water and Mining Company, has been discontinued for the season.

A NUMBER of prominent citizens of New York, who have been firemen, intend to organize into a company, provide uniforms, and visit the Paris Exhibition, taking a steam fire-engine with them.

THE value of quails as insect destroyers is beginning to be duly appreciated; and they are now in some places encouraged to domicile themselves in our California gardens.

THE Swedish Government has lately built three iron-clad ships of the Monitor pattern, two of which (the Ericsson and Thunder) are afloat. The third, still on the stocks at the Motala works in Norrköping is 250 feet long, with great breadth of beam. The turret is of twelve thicknesses of inch plate iron, beautifully fitted together, and enclosing two 15-inch guns.

THE silver mines of Sanium, in Greece, after a lapse of two thousand two hundred and ninety-four years, are now worked by a French company, principally for the produce of lead. The works employ continually four hundred workmen, and seven furnaces. From ten to twelve British vessels take the coal required, and bring to England cargoes of lead.

THE New York Tribune speaks of a new desulphurizing furnace invented by Prof. Thos. D. Worrall; and without describing its construction, says: "His aim was to produce a regulated, gradual passage of the finely pulverized veinstone through the intense heat of the furnace, so as to secure the complete expulsion of the sulphur, etc.; and he seems to have perfectly succeeded."

THE Colorado Journal says the first gold discovered in that country, was made at the head of Cherry creek, near Russellville, in the month of August, 1858, by a party of Georgians. Gold was afterwards found a mile or two above Denver, at the old "Spanish Diggings," and on "Dry Creek," three or four miles above the Spanish diggings. Russell's Gulch was discovered in June, 1859, and is on the headwaters of Clear Creek, about forty miles from Denver.

SAN ANTONIO, Texas, which, although it is the oldest city in the United States, with one exception,—has hitherto escaped cholera,—has been visited by that scourge within a few weeks' past. Large numbers of the people have been carried off. Business was almost totally suspended. San Antonio is considered one of the healthiest places on the Continent, and before the war was a noted place of resort for invalids from all parts of the Continent.

THE Emperor Napoleon will contribute to the Paris Exposition a model for a workman's house of his own design. The plan unites with lowliness of price all the accommodations desirable and the conditions required by the public health. By paying a moderate rent, one part of which would be devoted to a kind of sickling lund, the tenant would in a few years become the proprietor of his house.

C. F. SCHAEFER, the famous German traveler, who is making a tour of the world on foot, is now in this city en route for Mexico, Central America, and South America, and ultimately he goes to China, Japan, and the countries of the East generally. He has already traveled on foot over a large part of Europe, Africa, and Eastern Asia. He is deformed, not being over four feet, eight inches in height; yet he has already traveled seventy-five thousand miles in this manner.

NEVADA SALT SPECIMENS IN WASHINGTON. Postmaster General Randall has received from Special Post Office Agent Lawrence, a box containing specimens of mountain salt from the "Pahranaquut" mining regions. They are fine, pure and almost transparent. One of the pieces shows the face of the mountain from which all are taken; the other pieces were taken back from the surface. This salt came from a mountain of pure salt, several layers in extent and several thousand feet in height. It is situated in the extreme southern part of Nevada, between the 115th and 116th degrees of west longitude. Mr. Lawrence says these pieces are not sent as fair specimens, but in his next trip to that region he will undertake to procure a block of a foot square of such transparency that a newspaper can be read through it.

THE NEW DRY DOCK.—The work of constructing a Dry Dock at Hunter's Point is progressing with rapidity. This Point is located at the eastern end of the South San Francisco tract, and is some four miles distant from the City Hall. The *Times* says: One hundred and twenty men are employed on the work. When completed, the dock will be 450 feet long, 600 feet wide at the top and sixty at the bottom, and thirty feet in depth, making a capacity sufficient to dock any ship that floats, except the Great Eastern. The docks will be closed in the manner of the French docks, by a caisson or floating gate, which is a boat, ninety-eight feet wide at the top, sixty at the bottom, twenty-four feet high and twenty feet deep. This, when filled with water, and placed in position, sinks down across the mouth of the dock. Around the sides and bottom of the boat is a keel-like projection, which fits into grooves in the side and bottom of the dock. By opening gates and letting the water partially from the caisson into the dock the caisson rises out of the grooves and can be towed away from the mouth of the dock to let vessels enter or leave. This style of closing a stone dock is considered better than any other.

The contract price of the dock, without lining, will be \$250,000. If lining is necessary \$25,000 will be added. A bulkhead, workshops, machinery, etc., will probably cost from \$100,000 to \$150,000 more. The steam pumps will have a capacity to pump out the dock in two hours.

A QUEER FISH.—The Santa Barbara correspondent of the *Bulletin*, thus describes a fish which is found on the California coast: "This strange creature is furnished with a pair of singular appendages to the ventral fins, two inches in length, which, to the touch, are almost as soft as the udder of the cow, and on pressing them a liquid issues of the consistence of thick milk, which gives color to the stories of the fishermen of Chili and Lower California, that they suckle their young as does the fur otter, and that their fishlings are brought forth from eggs, similar to that family allied to the *Squalidae*, whose square leather egg cases are often seen on our sea shores after heavy gales. The fish, which is not common, is found as high up as Monterey Bay; weighs sometimes as much as two pounds; is like an eel; has no scales; is of a beautiful light russet; and the teeth are so small and close together that they appear like circles of thin bone. The head is as strange a feature as the ventral opposites, being furnished with a small, movable, finger-like, horny appendage, attached to the extremity of which is a knot, the figure of a strawberry covered with small spires which fits into a cavity made for it right above the nose, which is said by the fishermen to answer for bait and hook to its prey. The California species is one-fifth smaller than the European, and about a third larger than those of Coquimbo, measuring some eighteen inches in length, but very seldom found over two pounds weight—at least of some twenty we have seen none that went over that."

Mammoth Quartz Lode, Keysville District, Kern County.

"To all whom it may concern,"
ALL PARTIES negotiating for interests in the above Lode, would do well to examine titles before investing, as the legal title to a considerable portion thereof is vested in the undersigned.

CAUTION!

NOTICE.—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 27th, 1864, and issued June 27th, 1865, to Professor Henry Wurtz, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR METALLIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY,
OF NEW YORK,
Assignees of letters patent granted to Prof. HENRY WURTZ, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.
The terms and conditions upon which rights to use the process are obtainable, can be had on application to

THIS CUT REPRESENTS AN AMALGAMATOR and Separator that has stood the test of many years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sickened" in the battery or grinders.

3d. The "mashing" motion given to the pulp (by the revolution of the muller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

ISRAEL W. KNOX, OR

W. A. PALMER, Inventors,

At the Golden State Iron Works, No. 19 First street, San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines at the lowest of the following low terms:
No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price \$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—price 850
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour—price 1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass over. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, drives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

Bearings Ranch, Tuolumne Co., Sept. 28, 1866.
James Brodie, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your large sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
R. P. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN ANALOGATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscriber.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22nd, 1866.

REPORT

—OF THE—

COMMITTEE

—ON—

SEWING MACHINES!

California State Fair, 1866:

"To the President of the State Agricultural Society: Your Committee on Sewing Machines beg leave to report that we have examined the several Sewing Machines on exhibition, (the Grover and Baker, the Wheeler & Wilson, and the Florence,) and find that

FOR GENERAL FAMILY USE

—THE—

"FLORENCE"

—IS—

"THE BEST."

(Signed)

J. N. ANDREWS,
THOMAS C. McHALE,
L. ELKUS.

If there is a FLORENCE SEWING MACHINE within one thousand miles of the San Francisco Office, that is not working well and giving perfect satisfaction, it will be attended to, if I am informed of it, without expense to the owner.

SAMUEL HILL,
General Agent, 111 Montgomery street, San Francisco. 17v13

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge. If in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

HOOKE'S PATENT EXCELSIOR PUMP.—This pump is already in extensive use. The advantages claimed for it are important ones. It will not only force water from a greater depth than any other pump in use, but it is less liable to choke. It is simple in its construction, having no intricate pieces liable to misplacement by ordinary workmen in setting it up; and no portion is so delicate as to be liable to breakage. It is, in short, perfect in its construction, good for long wear, and warranted to give satisfaction in every instance.

Among those who have adopted it, may be named the following: C. J. Newcomb, Calaveras County; Palmer & Co., quartz miners, Nevada; The Vulture Mining Company, Arizona; the Gas Works at Nevada, and the three sugar refineries in San Francisco. They are also in use at Little York, Grass Valley, Austin, Reese River, and several in Kern County.

The proprietors, Messrs. Cushing & Co., are now having them manufactured at the Union Foundry, Messrs. Booth & Co.'s establishment. All sizes, suited for different purposes, can there be found. The hand pump, as we can testify from experience, works with remarkable ease. One of this kind was exhibited at the Mechanics' Fair one year since.

HUNT'S WINDMILL FACTORY.—During the past week we paid a visit to Hunt's Windmill Factory and Machine Shop, No. 28 Second street. Mr. Hunt is well known to our citizens as one of the pioneer mechanics in San Francisco, and we are pleased to observe the indications of thrift and progress about his establishment. Probably no mechanic on the Pacific coast has brought out more inventions than Mr. Hunt. He manufactures at his establishment windmills, horse powers, pumps, pumping frames with gearing and balance wheels, saw frames, and several other useful machines, of his own invention. Give him a call and examine his work.

ADJUSTABLE STILTS.—Mr. A. I. Frick, of this city, has devised a step which may be readily adjusted to the sticks ordinarily used by boys for stilts, but which will be found much more convenient and safe than the hanging contrivances usually employed. They are made of cast iron, are light and neat, and can readily be adjusted to any distance from the ground, high or low, as they may be wanted for the moment. A pair of these will make a very pretty present for Young America, and they should not be overlooked among the holiday novelties. They may be found at the Metropolitan Book Store, corner of Market and Montgomery streets. Patent applied for through our agency.

HENDY'S NEW CONCENTRATOR, mentioned in last week's issue, can be seen at the Union Foundry, on First street, where it is manufactured. It will soon be illustrated in our columns.

"W. F. S."—A letter from "W. F. S.," of San Jose, on "Electrical Phenomena," is in type, but has unavoidably laid over until next week.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the **MINING AND SCIENTIFIC PRESS**, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. TO MINERS, MILLWRIGHTS AND FARMERS.

We beg leave to call your especial attention to the

EXCELSIOR

Double-Acting Suction and Force Pump.

Hooker's Patent, Aug. 15, 1865.

This Double-Acting Suction and Force Pump, the best in use, is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and is warranted to furnish more water, than any other Pump of equal caliber. It has Puppet Valves, faced with vulcanized rubber, which cannot be wrongly placed in the Pump. The valves can be changed without disconnecting air-chamber, suction or discharge pipes.

In case of necessity, the Pump can be run at any high rate of speed, and will furnish water proportionately. The Excelsior Pump is equally adapted to use for surface and deep wells or shafts. It can be run by windmill or horse power for irrigating purposes; also by hand or steam power on steamers and ships. For domestic use, no better Pump can be found.

Fig. 3.

Fig. 3 represents a Hand Pump, which works very easy, and with even power. Fig. 4 is a 6-inch Mining Pump, showing adjustable bonnet of the valve chest.

For Circulars, or further particulars, inquire of or address J. W. BRITTON & CO., Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or 1am4S

SCIENTIFIC INVESTIGATIONS.

Scents and effluvia have long formed a favorite illustration of the divisibility of matter. No chemist ever weighed the perfume of a rose; yet that perfume not only has weight, but also exercises, by its presence, a most powerful influence upon radiant heat. The perfume of otto of roses intercepts thirty-six times as much solar heat as the same quantity of atmospheric air. Philosophers have devised contrivances, by which they are enabled to measure, with the utmost exactness, the relative percentage of heat absorbed by different gases and odors. The small quantity of volatile matter which a person may inhale, at one breath, from a vial of hartshorn, is thus proved to be capable of absorbing more radiant heat than a large roomful of atmospheric air.

Taking atmospheric air for unity, otto of roses, as we have already mentioned, will absorb 36; lemon, 65; thyme, 74; camomile, 87; cassia, 109; spikenard, 355, and anise-seed, 372. Though it would be idle to speculate upon the absolute weight of the quantity of the substances named which may effect the above results, still

"The sweet South wind,
That breathes upon a bank of violets,
Stealing and giving odor."

owes its sweetness to a matter which, though extremely attenuated, is nevertheless far more potent in intercepting the rays of the noonday sun, than the entire atmosphere between it and the sky.

Such delicate experiments as have determined this fact would seem at first almost beyond the reach of human contrivance; but the cunning art of man, aided by his high order of intelligence, is searching out, in these latter days, facts but little dreamed of in the philosophy of a hundred years ago.

The sublime inquiries in the physical sciences, which have recently occupied a large portion of the attention of European philosophers, and which have led to the full demonstration of the new law of the "conservation of forces"—a law which is now acknowledged as the underlying principle of all philosophy—awakens thoughts and kindles emotions in the thinking mind, which appear to reach out toward the ultimate, until we can almost seem to see the dynamic chain which binds into unity the realms of matter and mind, throughout the entire measureless fields of time and space. And yet there are minds which see in all these realities but the dim dawn of discovery in the mysterious regions of science. If, indeed, these discoveries are but "pebbles" upon the shores of the great ocean of truth, which they are thought to be, how stupendous must be the mysteries still bidden in the bosom of the unexplored, and how far transcending all stretch of human thought must be that unknown, but infinite Great First Cause of all things, to which the highest human intellect turns in solemn, humble and mysterious worship!

CENTRAL DISCHARGE WATER WHEEL.

We give annexed an illustration of a very cheap and simple water wheel of the turbine variety. From the peculiarity of its action, it is known as the "Center Discharge Water Wheel." It can be economically applied wherever an abundance of water can be obtained with any considerable head. For such localities, it is probably one of the most simple and most effective wheels, for its cost, which can be obtained. The wheel is manufactured and sold at the Miners' Foundry, in this city, where tables can be found, showing the working velocity and amount of power derivable from any quantity of water under given conditions of height. The peculiar action of the wheel will be at once recognized on examining,

CENTRAL DISCHARGE WATER WHEEL.

the illustration. The wheel, it will be recollected works in an enclosed case. The arms, their form and direction of movement, together with the manner and place of the exit and entrance of the water, will be readily ascertained by consulting the illustration and noticing the direction of the arrows.

LINCOLN SCHOOL EXHIBITION.—The time of holding the Lincoln school exhibition has been changed, and it will take place on Thursday and Friday evenings, Dec. 6th and 7th, instead of on the 13th and 14th, as at first proposed. The change is made to accommodate others who propose giving exhibitions. This exhibition is to be given for the purpose of raising a permanent "Medal Fund" for the Lincoln school, the interest of which is to be expended in procuring medals for those pupils who distinguish themselves in deportment and scholarship. Everybody ought to encourage the object, as well as the boys. The exhibition promises to be one of the best ever held in the city. It will be held at Lincoln Hall.

THE CUTTING BROMIDE PATENT.—The San Francisco Photographic Association, has decided to purchase the right to the use of this patent in this city, of Messrs. Bradley & Rolofson. The price to be paid is \$2,000. A committee had previously been appointed to examine the validity of the title. The committee ascertained that it was generally recognized in the Atlantic States.

THE ALTA AND ITS ELECTRO-QUAKE THEORY.

The *Alta California* has attempted to explain away our remarks respecting the electro-earthquake theory in a manner which only serves to show the utter unacquaintance of the writer respecting matters on which he attempts and thinks to enlighten his readers, otherwise he would not have referred to the lamp-post as a case in point; although, if necessary, the point we named could be established by that proposed crucial reference; and in order to do so it is not necessary that the columnar structure need be twisted. It would only require to be overthrown from its base. The entire article is one which displays such a thorough unacquaintance with the matters in which he attempts to be so facetious, that it is not worth entering into serious criticism. To do so

THE IRON AND STEEL ASSOCIATION.

THE IRON INTEREST IN CONGRESS.

Important results are already perceptible from the influence of the "American Iron and Steel Association." This association is designed to promote intercourse between the iron manufacturers throughout the country, on all subjects of common interest, embracing philosophical, mechanical and commercial, as well as economical. It is clearly evident that its influence is destined to become powerful in promoting sound and intelligent legislation in Congress. In accordance with an invitation from the association, Secretary McCulloch, Commissioner Wells, Senator Fessenden, and several other prominent men from Washington, have recently spent a week in visiting the leading iron regions of Pennsylvania. Great hopes are entertained that this visit will conduce to wise Congressional legislation in behalf of the iron interests of the country, than which no branch of industry is more worthy of being promoted.

Another evidence of promise in this direction is involved in the circumstance attending the recent election of D. J. Morrell, Esq., of the Cambria Iron Works, Pennsylvania, for the Seventeenth Congressional District of that State. This election is not only flattering to Mr. Morrell personally, but also affords evidence that the interest felt in his behalf is above the ordinary influence of mere political issues. Although the majority in the State of Pennsylvania was not as large as it was in 1864, yet Mr. Morrell's majority was nearly three times that of his predecessor, who was elected by 509 majority, while Mr. Morrell received 1,319.

No man in America has done more within the past two or three years to build up the iron interest of this country than has Mr. Morrell; and we can well understand how grateful workingmen and intelligent voters can, for the moment, drop all party issues and unite in placing so able and useful a man in a position to render his great influence still more widely felt. His efforts in Congress cannot fail to exert a most marked influence in the legislative action of that body in reference to the great industrial interest which he more particularly represents.

Mr. Morrell is fully imbued with the importance of placing the iron interest of the country entirely independent of foreign markets, for the staple of our manufactures as well as for the manufacturers themselves; he also understands that the true way of cheapening the cost of iron is to encourage its home production, and thus promote home competition and home industry. The American industrial system is one of harmonious interest—such as, what affects one affects all. From the most limited of our agricultural proprietors up to our most extensive manufacturer, all have a common interest in the general promotion of American productions.

It is said that M. Columbo, the only living descendant of Christopher Columbus, intends visiting the United States during the coming summer.

THE SAN JOAQUIN CANAL COMPANY, with a capital stock of \$1,000,000, has been incorporated. The object of this company is to construct canals in San Joaquin county, for irrigation and for manufacturing purposes. They will commence work early in the coming spring. A large extent of country which is at present unproductive, in Fresno, Merced, Stanislaus and San Joaquin counties, will, by this enterprise, be reclaimed. The canal will be thirty feet in width, and five feet in depth; and will be used for navigation as well as irrigation. By it the Tulare valley products will be brought to the threshold of our San Francisco markets.

COLORS FIXED ON MARBLE.—It is said that Dr. A. Hill, of Norwalk, Conn., has recently invented a simple process by which oil painting can be executed on marble, with the colors as permanently fixed as in stained glass.

The Paid Fire Department goes into operation on Monday next, December 3d.

Communications.

In this DEPARTMENT we invite the FREE discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

From Calaveras County.

BY A LADY CORRESPONDENT.

EDITORS MINING AND SCIENTIFIC PRESS:—Your "Lady Correspondent" has crammed her portfolio with statistics, and filled her books with notes (not greenbacks, you know) and feel impelled to rush into another column of print. I still retain the ability to tell what I think, and I feel that all those grand pine trees, stiff and straight, and strong as truth itself, and particularly the one that shades me, with long limbs stretched out for arms, at the terminus of which hang heavy pine cones for hands, have pronounced a benediction on my effort, and dropped a cone of some pound weight at my feet for an "Amen." The grim old ledge on which I sit, with a high backbone above the ground, bleached by "wind and weather," says something about "hidden worth" and gives a maxim, "no excellence without labor." Judging by its thick granite walls, and its method of hiding its gold in its sulphurets, I can but say, "I concur." While I aspire to rival the State Statistographer in hitting facts as to mines, I would gracefully yield the palm when it comes to hitting the miners. To cut so keen and sharp, that the victim don't know he is hurt till he tumbles into halves in attempting to move, is Ross Browne's pen-prerogative, he all the time looking as mild as the very concentrated tailings of crushed innocence!

An extensive group of veins surround West Point. The district embraces the three principal forks of the Mokelumne river. It is tableland, such as is usually interposed between the top of the foot-hills, and the foot of the Sierras. It strikes me as a most favorable mining locality. The branches of the Mokelumne afford ample water power, extensive pine forests give fuel and lumber, and the fertile soil yields good returns to the cultivator. Fine orchards, gardens and vineyards are surrounding the homes of the miners, and there is room for more of these nomadic people to "pitch their wandering tents" and be at home. The grand feature, however, of the land is the quartz. The lodes are narrow, but many of them very rich. They are mostly sulphurets, the matrix holding from one to twenty per cent. of surfurous iron pyrites. In many veins the sulphurets are considerably decomposed, and then free gold is found abundantly. In others, where decomposition has been sparing of its labor, little or no gold is to be had for the crushing, and such veins are neglected, although assays prove the ore to be rich. Mining has been conducted in rather a primitive style, the Mexican armstrs being the favorite machine. The quantity of ore is estimated by the cargo, and not by the ton. Excavations for ore rarely reach a depth of thirty feet; and when a vein ceases to yield \$10 to the cargo, (three hundred pounds), it is condemned as dug out, and usually abandoned. A better mode is now being introduced. American miners are sinking deep shafts, and American stamps are knocking the stones to flinders. Among the lodes taken hold of in the real California spirit is the Gettysburg. Mr. Newman of San Francisco, an early Gold Hill miner, is working several leys of men on the above vein, and has leased Leet's 5-stamp water wheel mill on the Middle Fork of the Mokelumne, to do the crushing. Gettysburg rock is accumulating in the ore yard, and the indications are that quantity and quality are gigantic—the mine may yet be called "Gigantic Gettysburg." Mr. Newman has a shaft sixty feet deep, and a tunnel 150 feet in length. Mr. Allen Harris, on Sandy Gulch, has a model 5-stamp mill with water power. He is kept busy with custom work. His books show, out of 400 tons, taken at random, of last years crushing, a yield of a little less than \$40 per ton. He estimates the expense of milling at \$2 per ton; counting incidental wear of machinery and interest on capital. The Woodhouse mill, a little lower down on the same gulch, a 15-stamp water power, is one of the oldest institutions here. The vein is really rich, but the ore was badly handled in those early days, and failed to enrich the owners, though the fault cannot be attributed to mill or mine. With the present improved methods, the result would be very different. I may here state that Mr. Holmes of San Francisco, is putting up a 20-stamp water power mill on the same lead where it crosses the river. The works far advanced, and will be moving in a few weeks. I must name one more mine before I close. It is on Soap Root Gulch. I was unable to add to my collection some of the finest specimens of sul-

phuret ores I have ever seen. Gold particles amid bright green and orange spots, studded large masses of rock. The lode is two feet wide, and the entire mass, I was assured, was of the above description.

The veins in the vicinity of West Point pay from the surface; quite an item, as the "honest miner" will at once perceive. It produces one had result, however: the mere scooping out of rich spots without making permanent improvements of any kind. I saw several veins thus abandoned, without the least effort having been made to develop beyond the "pocket" that chanced to attract on the outcroppings.

West Point, Nov. 10, 1866.

PROCESS OF ROASTING ORES, ETC.

Translated from the German of P. Plattner, for the Mining and Gas-Light Journal, New York.

BY J. H. TIEMANN, M. E.

NUMBER THREE.

DIFFICULTIES ENCOUNTERED IN THE FURNACE.

On the other hand, if the height of the roasting chamber, or the size of the chimney, be not in conformity with the other dimensions of the furnace, the roasting, as far as the required object is concerned, is very difficult, or even altogether impossible. If, for instance, the arch is too high above the hearth, and the flue too large in comparison with the roasting surface, and the openings for the admission of the air are too wide, the admission of air, which always enters with a certain velocity, will be too great; it not only causes a cooling of the flame and of the ore near the working door, but helps also to dissipate the warmth already contained in the chamber; so that when the proper temperature is required, in the absence of a damper in the chimney, more fuel is necessary, and even necessitates, perhaps, the enlargement of the roasting surface. If, on the contrary, the arch is too low, that is, too near the hearth, or the flue too small, the flame comes in too close contact with the ore, consequently the atmospheric air, when admitted in the same quantities as in a furnace where the arch is higher, gives off too little oxygen for the oxydation of the sulphur and arsenic metals in the ore. Thus, not only is the roasting retarded, but the result of the roasting is not such as desired. But when all the parts of the furnace bear a proper proportion to one another, and if, according to the nature of the fuel, the size of the hearth and the openings for the admission of air bear a proper proportion to the size of the roasting surface, the roasting may be carried on with the least possible waste of fuel.

In all these cases, however, the gases which pass from the roasting chamber into the atmosphere, consist chiefly of undecomposed atmospheric air, because the circumstances are not such as make it possible to deprive the air which enters the chamber of its oxygen in greater quantities than actually happens; for only that portion of it gives up its oxygen which comes in immediate contact with such bodies, which in a glowing state, or heated to a certain grade, are inclined to absorb oxygen. The action is the same here as in the burning of the combustible gases when a common candle is lighted, where the air flows towards it from all sides, and yet only that portion gives up its oxygen which comes in immediate contact with the hydrogen and carbon of the heated ascending gases.

In the place of a solid flame-giving fuel, a gaseous fuel is used—for instance, a mixture of carbonic oxyd with carburated hydrogen (including the nitrous oxyd of the air). When the air, at a proper temperature and in proper proportions, comes together in the roasting chamber with the gases from the generator, a less extensive flame than in common roasting is formed, because more atmospheric air has been already absorbed for the combustion of the carbon. So that consequently the gaseous combustible products which enter with the visible flames are present, not only in larger quantities, but are also hotter.

Less air being therefore required to pass through the openings into the roasting chamber, to obtain the same objects in a furnace with ordinary fuel, the arch may be somewhat lower.

In regard to the amount of oxygen extracted from the atmospheric air which enters the furnace, the same general rules are applicable as have been given for furnaces heated with solid flammable fuel.

Roasting furnaces which are constructed to economize fuel, whether heated by solid or gaseous fuel, are applicable to roastings where perceptible loss of metal by volatilization is not to be feared, or where the condensable volatile substances, notwithstanding the heated gaseous combustible products and a considerable draught in the furnace, may be collected in special condensers. In roasting, however, where at certain periods it is necessary to change the temperature, such furnaces are best adapted which are constructed for solid flammable fuel.

Besides the condition, that during the roasting

process of sulphur and arsenic metals in a roasting furnace, sufficient air must be admitted for oxydation, it is also necessary that the position of each individual grain of the ore or product should be changed during the oxydizing process. The chemical composition of the substance must be taken into account, and how it comports itself upon being heated in combination with atmospheric air, and whether it is better that the heat should be applied directly in an ordinary roasting furnace by the ignited gaseous combustible products, or whether it should be heated from the hearth of a muffle furnace. It is well known that many ores or mill products containing easily fusible sulphur metals, upon being heated and atmospheric air admitted, sinter easily when the individual particles are not disturbed in their positions, as the sulphurets of antimony, lead, copper, etc., while others are less inclined so to do, as the sulphurets of iron and zinc. When the heat necessary for roasting is produced directly by the heated combustible products of the fuel, the temperature is easily regulated and kept at the desired point for the proper roasting of the substance in hand. When the ore or mill product to be roasted is inclined to sinter, it is stirred by means of the roasting rake, the hot surface ore mixed with the under portions, in this way gradually disseminating the heat through the whole mixture, the part lying nearest the fire, by means of a roasting shovel, is brought to the opposite side, and, vice-versa, that nearest the flue brought next the fire, in this manner keeping the whole body of the ore at such a temperature as will best obtain the desired result, and which is best applicable to the ore in hand.

[To be Continued.]

Nobel's Patent Blasting Oil---Nitro Glycerine.

We have received the following communication, referred to in our last week's issue. It seems quite probable that this agent, so powerful both for good and evil, the very name of which was horrifying to us six months ago, will yet come into general use. We learn that it has been adopted for blasting purposes in the Hoosac tunnel in Western Massachusetts. It is of course unnecessary for us to urge the necessity of implicit obedience to the instructions of the agents when handling it.

EDITORS PRESS:—As it may be interesting to many of your readers, and especially to those who are engaged in blasting operations in the interior, either in mines or otherwise, to know what has been done with the Nobel's blasting oil (glonoin) consigned to us, and whether, since our successful experiments here and on the Central Pacific Railroad, the continuance of which was cut off by the explosion in this city, new trials and experiments have been made—to the persons so interested we would say: Although we have received since the explosion here many orders for the oil, more than we could have filled, yet, considering the aversion and fear many people, particularly in this city, have for the same, we have refused, until lately, to fill a single order. Of the three cases sent up by the Railroad Company to their place of working, only two were used; the third one remaining exposed to the greatest heat and change of temperature, near Dutch Flat, at Camp No. 22, until a short time since, when some persons engaged in and owning a mining claim at Michigan Bluff, Placer county, thought of us this remaining case and took it to their mine. These men, on commencing to use the nitro-glycerine, were entirely unacquainted with it, and made their first experiments according to instructions furnished them by us. They have made, up to this time, more than thirty blasts, large and small, most of them from the beginning resulting in perfect success. They write us that the effect of the oil is at least ten times greater than that of powder would be.

Mr. C. S. Swenson, who is one of the owners of this mine, has contracted for eleven cases more of Nobel's nitro-glycerine, and expresses himself so much in favor of blasting oil in every respect that he intends to use this article henceforth exclusively. He states, further, that the superiority of glonoin is especially remarkable in the kind of soil he is blasting in at present, which is a very tough pipe-clay, in which powder has but very little effect, and that the great saving by using oil, besides its superior power, is in the fewer and smaller boreholes necessary for a much greater result. Another great point in its favor is, the effect of a blast commencing from the bottom of the borehole. Mr. Swenson reiterates the opinion of all others who have used this oil, that the handling of it is not more dangerous than that of powder, and the charging of a borehole occupies but a very few minutes, as no hard tamping is required. Mr. Swenson having tried both water and loose sand tamping, recommends the latter.

Congress, at its last session, passed a law in relation to the packing of nitro-glycerine for transportation to and in the United States. In order to comply with its requirements in every particular before filling any of the numerous orders which we have for the oil, and this lot being packed in tins of twenty-seven and one-half pounds, surrounded by saw-dust, with the assistance of Mr. C. S. Swenson and two other

men, we opened all the cases, took out the tins, re-packed them in new, strong boxes, and filled the space between the tin and box with moistened plaster of Paris, surrounding the whole tin by a hard substance, which makes future transportation entirely safe. Supposing that the prejudice against and fear of this blasting oil, which the explosions here and at Aspinwall created, would yet entail difficulties in forwarding our lot to Sacramento, we concluded to take advantage of the opportunity which was offered us by the sale of eleven cases to Mr. Swenson, who had a boat engaged for Sacramento to carry the oil to that place, and to facilitate the delivery of any desired quantity to our customers, by sending the balance also to Mr. Swenson's place at Michigan Bluff.

The maxim that the human mind can control whatever it can invent, has never proved so true as in the invaluable invention for making the nitro-glycerine in explosive, and thus harmless for transportation, by adding to it a certain quantity of wood naphtha (methyl alcohol). We have been lately informed by the manufacturers in Hamburg that now only in explosive nitro-glycerine is exported to the different countries, or forwarded to their customers. To make the same explosive again, and to give the nitro-glycerine all its former power, any desired quantity of pure water added to the in explosive material will mix with the wood naphtha, and these two substances can then be poured off, when the pure nitro-glycerine, which is the heaviest part, remains at the bottom; thus, if a miner has a quantity of in explosive nitro-glycerine he pours into another vessel in weight somewhat more than is needed for the blast and extracts the wood naphtha, as described, which leaves him the pure oil ready for use, or the quantity required for the day is prepared at once.

The process of separation of the wood naphtha from the oil can be plainly observed if a white glass tumbler or decanter is used. Having a shipment of the wood naphtha on the way, we shell, on its arrival, publicly demonstrate the fact that nitro-glycerine can be made in explosive or explosive, at will, as before described. For this purpose we have retained one case of oil here.

When the excitement here, in consequence of the explosion, was at its highest, we were ordered to remove the oil from its then place of storage, near the powder-house of Messrs. Trendwell & Co., but we were for a long time unable to find any place where we were allowed to store it, and we kept it meantime in a little fishing-boat owned by Chinamen. Neither the city nor Federal authorities were willing to assist us. At last, by the kindness of the owners of the Manganesc Mine, on Red Rock Island, we were permitted to place the oil there, in an excavation in the rock, with the understanding that we were to make a blast for the owner of the mine. But even this secluded place was not proof against unwarrantable curiosity, as on one day inspecting the same we found that one case was entirely wanting, and that another tin had been violently struck into and opened by some blunt instrument, notwithstanding the fact that the nature of the article there stored was written on a board placed in front of the closed excavation.

To partly disabuse the public mind of the danger of nitro-glycerine, we would state, in conclusion, that when we were prepared to make the promised blast on the island, we found that the foreman had been so impatient to see the effect of an oil blast that he did not wait for us to acquaint him with the proper mode of blasting, but put in a blast in the following way himself: Having made a borehole, he took two paper cartridges as they are used in tunnels where the rock is fissure, filled them with oil, and placed them side by side in the borehole; on top of these he put down a third cartridge, charged with powder, and filled up the hole. On lighting the powder cartridge this exploded, but without igniting or exploding, as he supposed it would, the cartridges filled with oil; thus showing conclusively that an explosion or heavy concussion must be effected in the oil to explode it, and that even a heavy concussion outside or near to it will, in some cases, do no harm. A few more blasts made afterwards, under the direction of Mr. Swenson, in the proper manner, gave splendid results, and surprised the men by its superior power. Mr. Battles, the contractor for the manganese, as well as his foreman, acknowledged, after these few trials, all that is claimed for the new blasting agent, its immense power and consequent great saving of money, as also its entire safety when properly handled. As a proof of this assertion we have been requested to order several cases back from the interior, where the same have arrived, to be henceforth used by them. These gentlemen, as all others in this country who once have used the nitro-glycerine, prefer it vastly to powder, for reasons too numerous to be here mentioned, but enumerated in our pamphlets.

BANDMANN, NIELSEN & Co.

San Francisco, November 23d, 1866.

Mechanical.

Short and Long Screw-Drivers.

The further from the source of power, the more reduced is the effect which is exemplified in any system of machinery, or any mechanical action, which depends on a single motive power, turning an extended spindle or shaft, the motion of which keeps remote mechanism in action. A very simple exemplification of this fact may be found in the operation of the ordinary screw-driver, with the hand as the motive power. The carpenter often imagines, that with equal force of hand and both instruments identical in their relative proportions, a long screw-driver is more powerful than a short one; because, in his practice he finds that the longer starts a rusty screw that he cannot move with the shorter one. The fact is, power is lost by the long one, or the longer is the lesser power. Usually, however, in a long screw-driver the leverage is greater than in a small one, from a relative difference in length between the long axis of the blades and handles of the two instruments; in such cases the difference of leverage may overcome the reduction of effect by reason of the increase of length. In driving a screw all the force is in the direction of the required effect—forward. In drawing a screw a portion of the force (that due to the pressure) is contrary to the required effect. Lessening the pressure upon the screw, by increasing the long diameter of the blade, is what is gained by the longer over the shorter screw-drivers, when both instruments are identical in their relative proportions. The principle of the loss of power, by the removal of the effect from the source of that power, is universal in its application, and is due to the loss of momentum in the transference of that power from atom to atom along the line of transference. Power may be thus gradually exhausted or taken up; a notable instance of which is observable in the earthquake shock, which gradually "dies out," so to speak, as it recedes in every direction from the center of shock. This loss of power is moreover greater or less in proportion to the density and uniformity of the arrangement of atoms along the line of disturbance.

The Acid Test of Iron.

Although there can be no doubt but that the only way of obtaining accurate information respecting the strength of any particular kind of iron or steel is to subject it to directly applied strain, yet there are many circumstances under which such a test cannot be conveniently carried out, and where any test which does not require special machinery would be extremely useful. One rough test of this kind, which is frequently used, is that of breaking a sample of the material and judging of its quality by the fracture; and another, which is not so generally known or employed, is the "acid test," which is carried out by subjecting samples to the action of dilute citric or sulphuric acid, and noticing the result. This acid is particularly applicable when it is desired to ascertain the capabilities of the material for resisting wear, as, for instance, in the case of railway tires. Thin slices are cut from the tires to be tested, and the surfaces polished, and these samples are then placed in dilute citric acid for about twelve or fourteen hours. At the end of that time it is found that the structural formation of the tires is very clearly developed, the manner in which the piles were built up being plainly shown in the case of the iron tire, while in the case of those of steel the surface presents a more or less honey-combed appearance, according to the fineness of the grain of the material. Samples of Krupp's steel tires sometimes exhibit only a frosted appearance on the surface after a whole night's submersion in the dilute acid, whilst some slices of iron tires 3-16 inch thick, submitted to precisely the same test, were eaten completely through in some places. Speaking generally, it may be said that the power of resisting wear varies very much in the same proportion as the power of resisting the action of the acid, and the latter also shows clearly whether the material is of the same texture throughout, and whether it may therefore be expected to wear equally. A great number of samples of acid tests, have been subsequently photographed, with the aid of the microscope. These tests give most marked characteristics; as for instance: In meteoric iron the crystalline nature of the material is clearly exhibited, and in the gray pig, crystals of graphic carbon are shown shooting

through the mottled surface of the metal, while in refined cast iron long lines of hard parts are to be seen arranged in layers. Slightly-hammered bloom shows a confused mixture of iron and slag; Bowling bar-iron, a compact texture, and Swedish iron a still closer grain, more resembling steel. The various steels also present entirely different appearances; the difference between blister and cast-steel being strongly marked. Altogether, it appears that the acid test is an extremely useful one, particularly when assisted by microscopic examination; while the system of taking magnified photographs, affords an excellent means of registering the results obtained.

Oil vs. Coal for Steam-Boilers.

Some recent experiments in England in the use of oil instead of coal for steamers, are summed up as follows: This invention in its present form is not likely to supersede the use of coal for land engines, but appears to be one of great value for sea-going steamers. Thus, in the case of the *Persia*, one of the Cunard line of steamers, the following calculations will show what the result of the successful use of oils would be to its owners. It is calculated, from what is now being done, that eight gallons of oil per hour will be sufficient for each furnace, and that the steamer's fourteen furnaces, in a voyage of twelve days, will consume 32,256 gallons, weighing 169 tons, and costing £1,690. The *Persia* takes for her voyage and 1,500 tons of coal, costing about £1,500; thus showing that the cost of oil is £190 greater than the cost of coal. But against that there is a saving of 1,331 tons, which at £3 per ton for freight is a gain of £3,993; deducting from which the £190, the actual gain from one voyage is shown to be £3,803, to which sum must be added the savings of stokers' wages, as the apparatus is self-acting when once fairly in operation. The principle of the invention seems to be also applicable to smelting, glass making, and other similar purposes, where intense heat is required, which must be under perfect control.

The invention by which this oil is utilized consists in placing within the fire-box of an ordinary marine boiler a generator, into which crude shale oil, costing about sixpence per gallon, is admitted, in combination with a jet of steam; the two producing hydro-carbon gas, which produces steam rapidly, with scarcely any smoke and no smell. This method of using petroleum may be thus briefly described: Knowing that at a dull red, petroleum will be converted into gas, there is introduced into the ordinary furnace space an apparatus consisting of a gas receiver or distributor, below which are placed two pipes, connected with the receiver at both ends. Into three retorts, or generators, the oil is introduced through a feed pipe, the generators, in the first instance, being brought to the required heat by means of a small coal fire. The oil is turned on, and immediately is coming in contact with the heated iron generators is converted into gas, and rushes up into the receiver, whence it issues through small holes, and is burned as ordinary gas. All being in working order, the coal fire is raked out and another receiver with burners is placed on the empty grade, and being connected by a pipe with the upper receiver, a portion of the gas is thus conducted below the generators and burned under them to keep them, also, at the requisite heat.

ENAMELED IRON.—Some very elaborate works of art have recently been turned out from the Enamelled Iron Works of Mr. Baugh, of Birmingham, England. The work of this establishment is attracting a very considerable amount of attention, on account of the degree of perfection and general applicability which Mr. B. has reached in this class of manufacture. Not content with the application of enameling to signs and advertising boards of every description, he has applied his patent to the highest department of art, with a result which is most satisfactory. Mr. Baugh is now executing an order for the lining of the walls of some portions of the Kensington Museum with large sheets of iron enamelled with designs by Dr. Dresser. This fact is sufficient to mark the importance and value of the work now turned out. Attention is also being given to the imitation of the old enamels. The practice of enameling on copper was one of great difficulty, owing to the unequal contraction and expansion of the copper and enamel coating; in consequence of this the works produced on copper rarely exceeded the size adapted for trinkets. By the process now practiced by Mr. Baugh, an enamel can be produced almost to any size that a sheet of iron can be rolled. This enamel contracts and expands in the same proportion as the iron on which it is laid, and is so flexible that if the iron is bent in any direction no crack appears. In the show-rooms may be seen the wonderful variety of purposes to which the enamel may be put. We have no information with regard to the nature or cost of this new process.

Scientific Miscellany.

A New Theory of the Supposed Change of the Earth's Axis of Rotation.

A very interesting discussion in relation to the cosmical causes of changes in the earth's temperature, and the submergence of the northern hemisphere during the glacial period, and the cause of the supposed change in the earth's axis of rotation, took place at a recent meeting of the Royal Geological Society of London. The most interesting and novel portion of this discussion was in relation to the supposed change of the earth's axis, for which Mr. John Evans proposed the following theory, as reported in the *Londoo Quarterly Journal of Science*:

He takes the case of a sphere consisting of a mass of viscid or fluid matter, surrounded by a crust of inconsiderable thickness, and in a condition of revolution about a given axis. He then supposes the equilibrium to be disturbed by the protrusion of a portion of the crust somewhere between one of the poles of the sphere and its equator. The result would be, as Mr. Evans states, that the greater centrifugal force possessed by this protruded portion would tend to bring it towards the equator, and thus alter the axis of rotation of the external crust, which would adjust itself about the internal plastic and still spherical mass within. The rotation of the sphere and this excess of centrifugal force possessed by the protruded portion would cause the latter to describe a spiral, as it were, of gradually increasing dimensions, until at last it came into the line of the equator of the sphere, and described a circle, when the axis of rotation would again become fixed until some fresh cause of disturbance produced a repetition of the process. In the same manner Mr. Evans supposes the upheaval of large mountain-masses to have operated on the earth's axis of rotation; the only distinction he draws being that, from the spheroidicity of its figure, there would be more difficulty in the crust adjusting itself over the fluid nucleus.

This theory looks very plausible, but if we inquire a little further into the case of the supposed sphere, we shall get an indication of the kind of difficulty it fails to meet when applied to the earth. Imagine a second mass to be protruded after the first shall have arrived at the equator. Before we had to deal with a sphere having no tendency to revolve on one particular axis more than on another; but now there is resistance to be overcome—a resistance intensified by the rotatory motion of the sphere. So, in the case of the oblate spheroidal earth, for a mountain mass to affect the axis of rotation it must possess a centrifugal force sufficient to overcome the resistance presented by that of the greater protuberance of the earth at the equator, that protuberance being equal to a belt six and one-half miles thick at the equator.

THE ORIGIN OF CARBURETS AND COMBUSTIBLE MATERIAL.—A NEW THEORY.—Although those combustible materials which obviously result from the transformation of organic matter admit of ready explanation, there are others which are not so produced, as the carburets observed in the products of volcanic eruptions, and such as have been detected by M. Daabree in meteorites. These require some other explanation. M. Berthelot, of Paris, who has been making some scientific researches into the nature and composition of hydro-carbons, has recently made the important discovery that at high temperatures various hydro-carbons will combine with each other, and with hydrogen to form higher carbides of hydrogen. This discovery has suggested to him a new theory of the origin of petroleum. Daabree has speculated that the alkaline metals may exist in the free state in the center of the earth. Carbolic acid, M. Berthelot states, is everywhere infiltrated in the crust of the earth, and may come in contact with the alkaline metals at very high temperatures. In this way acetylides would be formed. The same acetylides, he states, would also be formed by the contact of alkaline metals with earthy carbones below even at a dull red heat. By the action of steam the alkaline acetylides so produced would set free acetylene, and this body being unable to exist under the conditions in which it must be placed, we obtain instead the products of its condensation—bodies allied to petroleum and bitumen. This view of the formation of the natural carbides of hydrogen, by purely mineral reactions, will no doubt

attract much attention from chemical geologists. While speaking of the carbides of hydrogen, we must not omit to mention the discovery by Mr. Schorlenmer of a new series in that still unexplored mine of discovery, coal-tar. These lodes are still under investigation, and will probably be referred to on another occasion.

Phosphorus.

Some remarkable results of the exposure of phosphorus to heat have been communicated by M. Hittorf to the *Annalen der Physik und Chemie*. Schroetter states that red phosphorus returns to the state of ordinary phosphorus at 260° C., but M. Hittorf finds that this change does not take place under a temperature of about 447° C. At a lower temperature red phosphorus may volatilize, and its vapor acquire a high tension without ceasing to belong to the red modification. The transportation of ordinary into red phosphorus may easily be effected by heating in a closed vessel at a temperature above 300° C.

In vaporizing amorphous phosphorus it does not melt; in this it resembles its congener arsenic, which resemblance induced M. Hittorf to endeavor to crystallize this variety of phosphorus, which he believed would take rhomboidal forms like arsenic; his experiments proved him to be right.

Of the numerous attempts made by M. Hittorf, we will cite only that which was successful, as recorded in the *Londoo Quarterly Journal of Science* for July:

It consists in heating red phosphorus and lead in a closed vessel, the lead dissolved the phosphorus, and then deposited it in a crystallized state. The operation was performed in a fusible green glass tube, a quarter filled with ordinary phosphorus and the rest with lead; the tube was first cleared of air by means of a current of carbonic acid gas, then exhausted, and afterwards sealed. It was now introduced into an iron muffle, and the spaces filled with calcined magnesia, pressed round the whole of the glass tube.

After ten hours' heating, the lead was covered with brilliant flakes of metallic-looking phosphorus, the finest appearing red when held to the light.

No polyhedral form could be recognized in these crystals, but the lead retained some. These were isolated by treating with nitric acid of 1.1, which has no action on phosphorus, while it readily forms a phosphate of silver.

The crystalline powder accumulated at the bottom of the vessel was "metallic" phosphorus, which was then in the form of a mass of microscopic rhombohedra, resembling crystals of arsenic. In this state phosphorus is a conductor of electricity; at 15.5° C. its density is 2.34.

M. Hittorf classes the new modification of phosphorus in the same category with red phosphorus, and gives to the two the generic name of metallic phosphorus, which he subdivides into metallic crystallized, and metallic amorphous. Commercial amorphous phosphorus is often in the crystalline state.

A CURIOUS FACT in relation to the storage of solar heat for future use has been communicated by M. Jeannel to the French Academy of Sciences. Fused acetate of soda, allowed to cool in the open air, crystallizes in prismatic needles at +58°; allowed to cool, however, in a limited amount of moist air, it does not crystallize even at zero, but becomes a soft, translucent mass. If, after having been so cooled, it is exposed freely to dry air, and touched with a dry solid body, it suddenly assumes the ordinary crystalline form of prismatic needles, and rises to the crystallizing point +58°, or near it. M. Jeannel remarks that this experiment shows how solar heat may be stored up and made to appear again at will. It is possible, he says, in our climate, to raise acetate of soda under bell-glasses or glass frames to +59°. The acetate so exposed and cooled, sheltered from the air, does not crystallize, and is always ready to give out the heat again on being touched with a dry solid body.

INDIUM.—A new source of the metal indium has been found by Dr. Kachler in the zinc blende of Schoefeld, near Schloggenwald, in which mineral it is associated with tin and other metals in such proportion that some grains of it can be separated. The blende is roasted, dissolved in sulphuric acid, and the solution treated with metallic zinc, the indium is then precipitated with the other metals, from which it can be ultimately separated.

From the Stock Circular of Associated Brokers of the S. F. Stock & Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, December 1st, 1866.

The Money Market remains easy, and the demand for local business purposes falls considerably short of the supply. We may safely remark a general increase of deposits in Savings Banks as well as in the other banking institutions of our city. Accommodations, on good first-class business paper, are readily obtained at $1\frac{1}{4}$ to $1\frac{1}{2}$ per cent. per month in Bank, and mortgage loans are freely made by the Savings Banks at $1\frac{1}{4}$ per cent. per month.

Legal Tender Notes have been slow of sale during the past week, owing, no doubt, to the decreased demand for taxes and other purposes. About \$10,000 sold in the Board within a range of $72\frac{1}{2}$ to $72\frac{3}{4}$ c, closing yesterday at $71\frac{1}{2}$ to 72 . June 7 3-10 Bonds sold at $78\frac{1}{2}$, and Oregon War Debt 6 per cent. Bonds at $77\frac{1}{2}$.

Our latest telegraphic advices from New York quote Gold at $140\frac{1}{2}$ to $140\frac{3}{4}$, and Sterling Exchange 109 to $109\frac{3}{4}$.

The duties paid at the Custom House in this city from January 1st to the 28th inst., amounted to \$6,816,669.14.

The market is well supplied with Bullion, and Gold Bars are in demand at 840 to 845 . Silver is selling at 1 to $1\frac{1}{4}$ per cent. discount for good bars. Telegraphic Transfers are made at $2\frac{1}{2}$ per cent. premium, and Sight Drafts, payable in coin, are selling at $2\frac{1}{4}$ per cent. premium. Currency Bills on the Atlantic are offered at 35 per cent. premium on gold. Sterling Exchange, 49d. for best bills, and Commercial do. $49\frac{1}{2}$ to $50d$.

City Stocks are not offered except at full rates. The sales have been meagre during the past week. California Steam Navigation Co. sold at 65 per cent., seller 30; San Francisco Gas at $63\frac{1}{2}$ to $63\frac{3}{4}$; Union Insurance Co. at 125 ; North S. F. Homestead at 14.25 to 17.50 , and Spring Valley Water at 61 per cent. The 22d installment of \$10 per share of the South S. F. Homestead Association is now due.

The recent very material advance in the more prominent mining shares has been well maintained. We have encouraging news from nearly all the companies whose shares constitute the business of the Board, and it is said that at no previous period did the Comstock lode yield so largely as at present. In most instances, so far as we have been able to ascertain, the bullion returns for the month of November will exceed the October yield.

Crown Point was in the market to a limited extent during the past week, opening at \$880, seller 30, advancing to \$905, buyer 30, improving to \$900 to \$915, and closing at \$1,000, s. 30. During the week ending Nov. 23d, 723 tons of ore were extracted from the mine, 154 tons of which were taken from the fourth station; previous week, 597 tons were raised. On the fourth level, in going north, the vein is said to be about 21 feet wide, and a breast 20 feet south from the vein shows 12 feet of ore. The ore from these points averages from \$38 to \$40 per ton. The east drift from the fourth station is in about 90 feet and runs in vein matter. The receipts of bullion for the month just closed are estimated at \$100,000. It is yet too early to obtain the exact figures.

Savage opened at \$1,800, buyer 10, steadily advanced to \$1,830, then a few shares realized \$1,980, the bulk selling at \$1,890 to \$1,925, closing yesterday at \$1,890. During the week ending November 24th,

2,057 tons of ore were extracted from the mine—previous week, 1,971. Of this amount 811 tons were second-class and 1,246 third-class, averaging nearly \$39 per ton. The two stations in the Curtis shaft yielded 731 tons during the week under review. The assay yield of the 2,057 tons is given at \$79,396; cost of production, etc., \$40,694; estimated profit, \$38,702; profit previous week, \$47,623. The upper stations are now more productive than for some time past, and the quality of ore is said to be improving. Winze No. 3 on the sixth level is now 25 feet deep, and carries good ore, and the north and south breasts on the seventh level—just opened—exhibit ore of the same average quality as is found on the sixth station. The lower station drift in the Curtis shaft is within 25 feet of winze No. 3 from the sixth, and, it is said, produces good ore. A short distance from the fourth station a new body of fine ore, some six feet wide, has been discovered.

Hale & Norcross is little inquired for in the Board, and remains in firm hands. During the week \$2,000 was bid and \$2,500 asked. The returns of bullion to the 26th November inclusive—65 per cent. assay value of 2,668 tons of ore—aggregated \$153,075.27.

Yellow Jacket was dealt in at \$930 to \$940, fluctuating between \$940 to \$960, then sold at \$1,000, and closed at \$1,175, s. 30. This company, it is said, have concluded to forward a weekly letter to the office in this city, and the regular monthly balance sheet as usual. It is said that in drifting east from the winze in the lower level, south mine, after penetrating the main body of ore and 40 feet of loose, barren quartz, a second body of rich ore was found, the extent of which has not yet been ascertained. In the north mine, they are 20 feet from the ledge. At the Morgan mill, 1,500 tons of ore have been accumulated.

Gould & Curry sold uniformly at \$500 during the first half of the present week, then at \$510, and closed yesterday at \$500. The yield of bullion from this mine for November will be considerably in excess of the October returns.

Chollar-Potosi opened at \$202.50 to \$205, rapidly advanced to \$225 and \$240, then sold at \$235 to \$230, and at the close brought \$220. The developments in the Blue Wing station are said to be more satisfactory. The first station drift south in the new shaft is in 20 feet, where the vein has contracted to 6 or 7 feet, and contains clay and porphyry. The shaft is now 117 feet deep. The amount of ore shipped to mills during the week ending Nov. 24th aggregated 781 tons; previous week, 694 tons. This company now employ 156 men.

Ophir sold at \$185, then at \$197.50, seller 30, receded to \$190, relied to \$200, and closed at \$215. The north drift on the ninth station looks more favorable, it is said, showing small seams of quartz, and is now 54 feet from last cross-cut; the east drift north has reached a distance of 100 feet. The eighth station south yields from 4 to 6 tons of ore per day, and the seventh station north has been connected with the Walsh shaft. The Ophir-Mexican shaft has attained a depth of 75 feet below the ninth gallery.

Empire Mill met with small sales, opening at \$130, then selling at \$126 to \$128 and again at \$130, and at the close \$135 is bid. This mine continues to yield as usual, and we hear it from good authority that a dividend of \$10 per share is likely to be declared for the present month.

Imperial receded from \$128 to \$116.50 to \$111, then sold at \$117.50, improved to \$125, and closed at \$125. Up to the 26th November about \$45,000 in bullion have been received.

Belcher was sold at \$117.50 to \$120, receded to \$116, and sold yesterday at \$135. Confidence ruled at \$62 to \$61.50, and at the close sold at \$61. Bullion opened at \$18 to \$20, advanced to \$21, then sold at \$18.50, and closed yesterday at \$17 to \$15.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday, amounted to \$595,997.50.

FRUIT STRAINS MAY BE REMOVED from white linen or cotton by first slightly moistening the spot with steam from a tea-kettle nose, or by allowing it to become moistened without dipping; then hold the same over burning brimstone. One or two lighted matches will answer the purpose; being careful to hold it so high as not to scorch, and yet to allow it to receive the full benefit of the fumes from the match.

505 Clay Street, corner Sansome,
SAN FRANCISCO.

Patent Cases of every kind conducted. Attention given to Re-Issues, Extensions, Interferences, Rejections, Appeals, etc., etc.

ASSIGNMENTS, POWERS OF ATTORNEY, AND LETTERS OF ADVICE CAREFULLY PREPARED.

COPIES OF PATENT PAPERS,
Issued by the United States or Foreign Countries, procured in the shortest time possible.

ENGRAVINGS, FINELY EXECUTED.

ESTABLISHED [] (MAY, 1860.)
VOLUME FOURTEENMining and Scientific Press,
COMMENCING JANUARY, 1866.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner Sansome, San Francisco.
Terms in Advance:—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly Series, \$5.50 per year, or 65 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.

The Mining and Scientific Press is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patron throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

DEWEY & CO., Proprietors,
Mining and Scientific Press Patent Agency, Newspaper Book and Job Printing Office, 505 Clay street - San Francisco.
G. W. M. SMITH. W. B. EWER. A. T. DEWEY.

Book Printing should be considered and treated as one of the higher branches of the "Art of Arts," and its execution entrusted only to experienced and intelligent workmen. Strict attention will be given to all orders for BOOK AND PAMPHLET PRINTING entrusted to the Mining and Scientific Press Job Office.

Baldness! Baldness!!

CAN BE PREVENTED, BY USING

Mayhew's Balsamic Hair Stimulant!

THIS REPARATION HAS BEEN USED AND RECOMMENDED by some of the most prominent members of the medical profession of this city.

For the removal of DANDRUFF, SORE, for preventing the Hair from falling off, and for producing a new growth, IT IS WITHOUT A RIVAL.

For particulars and references, see circulars accompanying each bottle. Prepared by

W. E. MAYHEW, Druggist,
N. W. Corner Fourth and Howard streets San Francisco.

He gives his personal attention to the preparation of Physicians' prescriptions.

Also, has constantly on hand a choice assortment of French, English and American Toilet Articles 1613-6w

Our Patent Agency.

The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Metallurgy.

To Copper Miners and Others Interested in the Working of Copper Ores.

THE UNDERSIGNED HAVING BEEN APPOINTED Agent and Attorney by N. Haskell for the sale of his COPPER SMELTING FURNACE, which has proved a perfect success, is prepared to furnish the same to parties having Copper Ores, or will make arrangements to buy their Ore, receivable at their mines. For further particulars, apply to
JOHN N. RISON,
2412 At Coffey & Rison's, San Francisco.MARTIN & CO.,
Office, Stevenson House,
Corner California and Montgomery streets (op stairs)WILL CONTRACT FOR THE
PURCHASE OF COPPER ORES.
Assaying eight per cent. and upwards of Copper to the ton. We will make advances upon Ores of Copper. San Francisco, Post Office Box 1259. 22EUROPEAN
METALLURGICAL WORKS,
—AND—
Practical Mining School,
Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in the Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

WE are receiving direct from MESSRS. LADD & AERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,

And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have in this branch of the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.
San Francisco March 6, 1865. 11v10-11

Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of "rebellious ores." Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 14v13-14

ELECTROTYPE CUTS, ENGRAVINGS, Etc.—Our Job Printing office is abundantly supplied with elegant engraving, ornaments, and other embellishments to suit the various branches of industry in this State.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Amador County—

From the *Ledger* of Nov. 24th: The Coney & Bigelow mill, now under the control of C. T. Meader, of Stockton, after lying idle for three weeks, during which time extensive improvements have been made, fired up on Tuesday last and is now running night and day on very rich rock. The appliances used in this mill for saving the sulphurets are unlike any others to be found in this State, and are nearer perfection than has heretofore been obtained. The machinery is the invention of Mr. S. F. Ambler, who is the superintendent of the mill.

The Kearsing mill is running again. At present it is only grinding sulphurets. It has been leased by Mr. Meader, who is attaching to it Ambler's sulphuret apparatus. When this is completed the mill will commence crushing rock from the Coney & Bigelow mine. Atchison & Co. are still pushing work on the Austrian mine, and the farther they go the better they are pleased with it. They will erect a mill at once. The quartz claim of "Old Boh," located in Walker's field, adjoining town, is proving better and better as the work progresses on it. That piece of ground is bound to prove a good investment to some one.

From Middle Bar, on the Mokelumne, to Yeomet, on the Cosumnes, the northern and southern termini of the quartz belt in Amador county, a distance of sixteen or eighteen miles, scarce a foot remains unclaimed. Nearly a hundred mines are fully or partially developed, and others are being daily uncovered. The number of mills will average one to each mile, and nearly all are profitably employed.

Calaveras County—

The following is from the correspondence of the *Chronicle*, dated West Point, Nov. 22d: The mining prospects of this portion of the county were never more promising than at present. During the past season numerous rich lodes have been discovered in various localities, and large quantities of paying ore are being mined from them. Heretofore the custom mills of our district have been ample to crush all the ores taken from the mines, and at times some had to lie idle for the want of ore to work on; but the miners, taking advantage of the present fine weather and good condition of the roads, are now hurrying their rock to the mills, and many of them are so crowded that they cannot possibly get through with their contracts for crushing before spring. From the Zacletara lode, at Skull Flat, they continue to mine large quantities of first-class ore, which yields regularly from \$100 to \$125 to the ton. In the Barnes mine, a short distance above the Zacletara, they have recently discovered a large body of ore, much more extensive and richer than that heretofore worked. Johnson & Willis have just finished their drain tunnel, and find exceedingly rich ore at a depth of fifty feet below their previous works. Parties working the Homestead mine, owned by Cummings & Hadler, have just finished crushing a large quantity of ore taken out during the summer, and it yielded them \$115 per ton.

Carlton is working a very rich lead located a short distance from the Homestead, and has out a large quantity of first-class ore, but his mill near by is so crowded with custom work that he cannot crush his own rock. A. Bouglival, formerly superintendent of the Mina Rita mill, has recently purchased the Oro Plata mine, on the Licking Fork, and, so far as he has worked it, has met with the most encouraging success. The lead is quite large, and yields very rich ore. He is now remodeling the mill belonging to the mine, and will commence crushing in a short time. Reed & Brown, of this place, are having a quantity of rock, taken from their lead at Railroad, crushed at Harris' mill, on Sandy Gulch, and it is estimated that it will yield over \$100 to the ton. Gratacap & Co. have out, at their mine at Railroad, some two hundred tons of splendid rock, a portion of which they intend hauling to Harris' mill next week.

[See also for Calaveras mines our correspondence for this week.—Eds. Press.]

Colusa County—

From the *Sun*, of Nov. 24th: The smelting works at Ashton are fast approaching completion, and before long we will be shipping the refined copper from our landing. The works have been erected at a cost of many thousand dollars, and the men who are managing the concern are scientific men. The first ton of copper refined will be the signal for active operation in a number of the claims.

Some months ago Mr. J. D. Abbott found indications of quicksilver about three miles from Sulphur Spring. He took up some claims and went to work, and in a very few

days struck a well defined lode. An extension was then taken up and a tunnel started, and ten days' work struck the same ledge about a thousand feet from Abbott's location. The cinabar taken out will yield about thirty per cent. of pure quicksilver.

El Dorado County—

From the Kelsey correspondence of the *Mountain Democrat*, Nov. 21st: The rich strike in the Woodside & Shanklin lode at Georgetown has given a new impetus to mining in this township. We have an abundance of gold-bearing quartz ledges, which only need developing to make them remunerative, and they will be worked now.

Georgetown correspondence of same paper, Nov. 22d: Fitch, who has charge of the first northern extension of the Woodside ledge, was in town last week looking at the claim and inspecting the work already done, and rumor has it that he will immediately erect works for pumping and hoisting. The prospect is good for a paying ledge.

The parties who recently purchased the Taylor ledge are here making preparations to commence work. This claim is located about three miles from town, in a southwest course, and has always had the reputation of being a good ledge. Considerable work has already been done on this claim, and there is now a large lot of rock out which it is calculated will pay well for crushing. Parties have been prospecting on the first extension of the Woodside claim and have found quartz which prospects very well, but at present the work is suspended. Some work is being done on the second southern extension, but with what success I have been unable to learn.

Klamath County—

From the *Humboldt Times* of Nov. 15th: Two tons of rich copper ore from the "Red Cap" claim, Klamath county, arrived here on last Monday. The Red Cap Company have now in store here ten tons of as rich copper ore as was ever taken from a mine on the Pacific coast.

Nevada County—

From the *Gazette* of Nov. 22d: In the California mine everything is going ahead like clock work. Since the hoisting works were started the incline has been sunk about sixty feet, being now two hundred and twenty-five feet below the surface, and fifty feet below the old works on the ledge. The work on the mill is progressing rapidly, the machinery being all on the ground, and the intention is to have it running about the first of January next.

The mill erected at the Grizzly ledge is nearly completed, and will be started in operation this week. The ledge is now looking finely. The mill has only five stamps; but if the ledge proves as valuable as is now anticipated, another mill of greater capacity will be erected next season.

From the *Grass Valley Union* of Nov. 22d: We yesterday saw a lot of magnificent specimens of quartz from the Union Hill. They were taken from the lower level, at a perpendicular depth of probably one hundred and fifty feet, where the vein varies in width from two to four feet, the ledge improving every foot as it is descended on. The quartz is well filled with beautiful free gold, and shows plenty of galena and very rich looking sulphurets. The ore now being extracted will average \$100 per ton.

The Gold Hill mine, which was the first quartz discovery made in Nevada county, and which has turned out more gold than any other quartz mine in California, although it has been almost idle for the past few years, has recently passed into the hands of Hooper & Co., who are determined to work it thoroughly.

From same of 23d: The inclined shaft of O'Connor mine, on Union Hill, is being pushed ahead in a most satisfactory manner. It is now down to a depth of about seventy feet, the work having been commenced only a few weeks since. The shaft is twelve by five feet.

From the *National* of Nov. 22d: Some radical changes are being effected in the arrangement of the works of the Empire mine. The hoisting works are being removed 150 feet north of their present position, over the old shaft, directly in front of the mill. The old shaft and works are being cleaned out and, in fact, everything is being arranged in a more convenient manner.

From the *Transcript* of Nov. 21st: George S. Pierce has just completed a 10-stamp quartz mill for the Eagle Company, at Grizzly Cañon, near the Magenta dume. The mill was built and started within three weeks. The company have a large amount of rock out, and will soon have a return from the mine. The Eagle Company own six or eight ledges in the vicinity of the mill. * * * The Gouge Eye Company at Hunt's Hill, cleaned up \$1,200 on Saturday, after 4½ days run. They have a fine body of cement in eight in the new tunnel. * * * Another rich strike has been made in the claims of Heydcliff & Co. They are said to be running on one of the richest streaks ever found on the Blue Lead.

From the same of 26th: County Assessor Bean has recently visited the cement mines about Hunt's and Quaker Hills, and has obtained some valuable statistics, from which we are enabled to learn something of the cost and profit of working cement. The Gouge Eye mill, owned by Goodspeed & Co., at Hunt's Hill, cost \$3,000. The mill has eight stamps, and is run by a hurdy-gurdy water wheel, which requires 52 inches of water per day. Water costs 25 cents per inch. The mill crushes 50 tons of cement every 24 hours, and the actual cost of working it is \$22 per day. The last crushing of 225 tons, worked in four days and a half, paid an average of \$6 per ton. This company has drifted on the channel a width of 150 feet, and have a bank of cement 20 feet deep. Among the other mills on the west of Greenhorn Creek are the Green Mountain, a new 10-stamp mill, and the Empire, which is of the same size. Carney & Tucker have a new 8-stamp mill which works 60 tons in 24 hours. The Eastern and Jenny Lind companies also have excellent mills. These mills are all run by water power, and use the hurdy-gurdy wheel, which is considered by miners the best in use. All the claims on the west side of Greenhorn Creek are looking well.

Excelsior.—From the *Sun* of Nov. 17th: The Winton mill and furnaces are now leased by Baron F. Stech and N. W. Winton. The former will have the management of the property. An additional battery of four stamps will be immediately erected and made ready for effective service. This mill and the Metallurgical works, will be employed during the winter chiefly in crushing and reducing, by chlorine process, ores from the Pacific and Confidence claims.

In a fortnight from this date the mill of the Mohawk and Montreal Company will be at work. It will be constructed on the shore of Phoenix Lake, a short distance from the ledge, and within a few feet of water. The expense saved in a year in the transportation of rock will alone pay the cost of the mill ten times over.

The Gold Hill *News* gives the following account of the trouble between the Golden Eagle and the Excelsior Companies. The former having struck a rich lead, the latter professed to claim a portion of the district, and during the night destroyed the frame of the mill which was being erected by the Golden Eagle. They also prepared to contest with arms the occupation of the ground. Not wishing to fight, the other party swore out a warrant and had the whole party arrested. After a two days trial, the officers of the company were fined, and in default of judgment committed to the lock-up. The occasion gave general satisfaction; and the citizens united in rebuilding the mill which had been torn down. The machinery for the mill is now on the Divide, between this place and Virginia, and will be forwarded immediately to Excelsior. The ore which is being taken out is said, by those just in from there, to be literally filled with free gold. The mill will be in running order about the first of January, and will be run during the winter.

Plumas County—

From the *Quincy Union* of Nov. 17th: There are two or three companies at work at the old Elizabethtown placer mines, and are making very good wages. * * * The French Ravine Quartz Company had declared and paid a dividend of \$175 to each share in the company—the expenses first having been paid. The money made by the company was by crushing quartz from the ledge in a hand mortar. There are eight shares in the company.

A few months since a company of men from the East Branch, started out to prospect for quartz in the Gravel Range section of this county. They hoped to be able to strike the extension of the French Ravine ledge. On their trip they discovered a small seam of quartz about one inch in width and four feet long, from which they took out enough to pay all their expenses on the trip and to declare a dividend of \$70 to each man.

Shasta County—

From the *Courier* of Nov. 24th: Kelly & Co. have removed the old Log mill from Midletown to their claim on the Jollie lode, and will have the machinery ready to run by the first of next month. * * * Last week the Mammoth Company cleaned up \$531.53, after a run of five or six days. The lode is now yielding some very rich rock, but owing to the bad state of the road leading from the shaft to the mill, but little headway is made, and the mill has to remain idle a portion of the time.

The Honeycomb company cleaned up after a short run last week, and realized \$234.80. We are not advised as to the amount of rock crushed. * * * The Kellinger Company have received returns from the twenty tone of rock recently sent to San Francisco for smelting, and we are informed that the yield was forty dollars to the ton, in gold and silver. Upon the strength of this result the Trustees have decided to commence the erection of

smelting works at Copper City, and work will also be resumed on the tunnel. * * * L. A. Kelley has made six careful assays of rock taken from different ledges in the South Fork district. The highest assay reached was \$495 20 in silver, and the lowest result was \$235.30. * * * Silver City, a mining village on North Crow Creek, is entirely deserted at present, the smelting works erected there having proved a complete failure.

A correspondent of the *Courier*, writing under date of November 16th, says: South Fork is brightening up; prospects were never more cheering. The Ohio company are sinking on a fine body of ore six feet thick, and showing native silver at every blast. The Pacific tunnel was run through a ledge yesterday which is exceedingly rich in gold and silver. Since the change in the proprietorship of the Crystal took place, the east ledge has been tapped at the distance of forty feet. The lode is three feet thick, with the same massive blocks of solid mineral as are now found in the celebrated Chicago. The shaft is being pushed down as fast as possible under the circumstances. The rock assays \$343 to the ton.

Workmen are busy taking out ore from the Potosi lode, which continues to improve in width and richness as the shaft descends. The company are erecting an ore house over the shaft. Work will shortly be resumed on the Live Oak claim, located on Spring Creek. The croppings of this lode prospect richer than any other quartz claim ever taken up in the county. A few years ago John Seaman took \$15,000 from a claim in North Cow Creek, and finally deserted it, thinking he had worked out all the valuable ground. Recently R. Barney went to work in the same claim, and discovered the continuation of the old pay lead, which prospects as high as fifty cents to the pan.

The Nevada *Gazette* says of the Chicago ledge: A tunnel has been run in the ledge a distance of one hundred and thirty feet, and a shaft sunk at the head of the tunnel to a depth of sixty feet. On the surface the ledge is about eighteen inches in width, and at the bottom of the shaft between four and five feet. From the rock taken from the tunnel and shaft, the owners have selected about twenty tons of first-class ore, which was shipped to San Francisco, where it sold at from \$200 to \$344 a ton. The remainder of the vein rock will yield forty dollars per ton by working process. It is forty miles from Red Bluff and sixteen miles from Shasta.

Sierra County—

From the *Messenger* of November 24th: The Oak Flat Quartz company, situated about eight miles south of Downieville, are quarrying a rich class of ores heavily impregnated with auriferous sulphurets, assaying \$382.16 gold per ton, and \$8.70 silver, making a total of \$390.86.

The Fac Simile company, in the same group of veins as the Oak Flat, from an average sample of vein (which was taken from 250 feet below the surface), forwarded for an assay test, a result of \$401.61 gold per ton, working process, was obtained. From concentrated sulphurets taken from sample after free gold was extracted, a result was also obtained of—gold, \$5,675.77; silver, \$85.80; making a total of \$6,163.18 per ton of 2,000 pounds.

Tulame County—

The Sonora *Herald* of Nov. 17th, says: The prospecting for quartz is now becoming more prevalent than at any time since the formation of our county. Practical miners have been for the past three weeks locating and working claims, some of which, they have informed us, have already shown good indications. Quartz mining is now being carried on extensively at Jamestown, and from the prospects of recently located diggings, great results are anticipated.

Yuba County—

From the Marysville *Appeal* of Nov. 27th: We understand that the new mill of the Pennsylvania Mining Company, at Brown's Valley, will be put into operation on Monday, the 10th of December. The machinery will probably be tested on Saturday or Sunday preceding, when a bottle will be broken over the piston and the mill pronounced good. The stock is now held at \$90.

Templar No. 2 have struck a well-defined ledge eight or nine feet in width. Several months ago the company lost the ledge in their incline and quit sinking it. They, however, went below and started a tunnel with the intention of running it three hundred and fifty feet towards where the ledge was supposed to be. The tunnel was run about three hundred and twenty-five feet on Saturday, where a ledge, in very hard casings, eight or nine feet thick, was struck. The water prevented an immediate prospect, but there is good reason to believe that it is a paying ledge. The question of its richness will soon be settled, as the company will immediately commence crushing. The effect of this discovery has made a wonderful change in the price of Templar stock. It has been selling lately for assessments of fifty cents, but to-day is held at five dollars. Sev-

eral feet were sold at Indiana Rauch, on Sunday, at this price.

NEVADA.

Washoe.—[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the Gold Hill *News* of Nov. 20th: Everybody is busy, both at the mines and mills. In Spring Valley, old claims are being relocated, we learn, to hold for low-graded ores, which there abound, and which will, within two years, be available when railroad facilities are added.

Same of 22d: All the mines of Gold Hill and Virginia are laying in very heavy supplies of timber for mining purposes. There is more life and stir among the mines of Gold Hill than we have ever before seen.

From the Virginia *Union* of Nov. 20th: The Gold Hill mill has suspended operations for the present, owing to a scarcity of water, but the company are busily repairing and overhauling it throughout, to commence work again when water becomes plenty. The Union mill has also been stopped for a week or so to repair their boilers and other things in general. The Crown Point mill stopped running on Saturday last for repairs. It will be running again in a few days.

Same of 24th: The Cole Tunnel is now in 1,550 feet, and those engaged in the work expect to reach the ledge soon. The last fifty feet run has been through very hard rock, but now a soft shell rock has been reached. When this company taps its ledge with the tunnel now being run, it expects to obtain a supply of thirty or forty inches of water. The new eighty-horse power engine of the Kentucky Mining Company is nearly ready for use. The frame of the new Petaluma mill is up, and workmen are now roofing it. There are two fine boilers, twenty feet in length, up and ready for use, and workmen are now setting the boiler, a forty-horse power. The mill is being built by contract, and a large force is at work on it. It will be completed in about three weeks, and will contain sixteen stamps. The Santa Rita Tunnel now supplies 35 inches of water, for which the water company pays \$40 per inch per month. The additional supply just obtained is needed, and it will perhaps enable some of the mills to start up that have recently been compelled to shut down owing to the scarcity of water. From the office of Wells, Fargo & Co., in this city, there were shipped, during the last week, 6,734 pounds of assayed bullion, valued at \$177,529.75; from their office in Gold Hill, 5,144 pounds, valued at \$160,915.47.

Reese River.

From the *Reveille* of Nov. 17th: Col. Buel brought to town last evening eight bars of bullion, worth about \$8,000. They were from his mine and mill at Silver Bend.

The same paper has an editorial, comparing the Comstock ledge and Mount Davidson with the Nevada Giant ledge and Mount Tenabo. The former seem small by the side of the latter. We quote: Mount Tenabo towers ten thousand feet above the sea, and fully a mile above the valley at its base. The great vein crops out for a distance of over five miles, crossing the mountain diagonally, going from its base on the southwest to past its summit on the northeast. So conspicuous and so mammoth are its proportions that it can be distinctly seen and traced from a distance of thirty or forty miles, resembling a great wall or balustrade to the towering dome of the mountain. The width of this vein varies from one hundred to eight hundred feet, and in it are found chimneys of ore showing above the surface thousands of tons, and of undisputable value. From these croppings several tons have been brought to this city from time to time, and found to work at the mills from \$150 to \$500 per ton. * * * The Cortez company are packing the ore on mules to their mill, some seven or eight miles distant. * * * This is only one of the veins of Reese River, and by no means regarded as the head, yet this has gone a begging for years. How much longer shall we wait? and what kind of facts or information do capitalists require to induce them at least to examine?

From same of 17th: The Savage mine, on Lander Hill, within the limits of the city of Austin, is one of those "razor-blade" mines which have been so vilified abroad. The following exhibit of the production of the mine from its first working in 1863 to November 14th of the present year, which has been compiled from the books of the office, will show the steady increase in the amount:

Yield of 1863.....	\$ 3,626 21
" 1864.....	29,608 75
" 1865.....	309,913 84
" 1866 to November 14th.....	165,114 27
Total yield.....	\$308,263 07

The yield of bullion for the present year will exceed \$200,000, as there is a month and a half yet in which to produce less than \$25,000, and the mine is now yielding over \$1,200 per day. But these figures do not nearly show

the production of the mine. Its huge ore dump—the accumulation of over three years—contains, according to the estimates of experts, fully 4,000 tons of ore, which will yield easily \$50 per ton. * * * As they go down the vein improves. The present hoisting apparatus and pump—which, by the way, were the first erected in this district—are inadequate to sink the work to a much greater depth, and it is the intention of the managers to place on the mine early next year, machinery of sufficient power to sink to the depth of 1,000 feet.

From same of 19th: On Saturday a handsome lot of bullion was brought into town from the mill of the Twin River Mining Company. There were about ten thousand ounces. We believe the stream of silver will flow steadily from that source in the future.

From the same of the 23d: Langworthy's Knickerbocker Mill, at Lone, is now, since the furnaces were rebuilt, regarded as one of the most efficient and complete in the eastern portion of the State. It is supplied with ore from the Great Eastern mine. The large vein of the Great Eastern yields mineral of different grades, which will work from \$60 to \$200 per ton. The great bulk of the ore is of the lower grade, but that can be reduced in a large mill at a handsome price.

Esmeralda.

From the Aurora *Union* of Nov. 17th: Mr. Zogalla, of the Mason Valley copper mines, leaves soon for New York, to make arrangements for putting up smelting works upon those mines.

Work is steadily going on in the Juanita and in the mine of the Philadelphia company.

In the Wilson District, on East Walker river, the country is being prospected in all directions. Several mills will be erected this fall. The Mastodon and Himalaya are getting good prospects. Wood and water are abundant.

Humboldt.

From the *Register* of Nov. 17th: G. W. Holt was down, this week, with bullion from his mill, situated near Guinca's Bridge. He tells us a marvelous discovery, apparently, has been made, within the past few weeks, some distance from Fairbanks' farm in Paradise Valley, Winnemucca District. Judging by the amount and appearance of the bullion produced from a working of 2,400 lbs. of the rock from the ledge, it will pay upwards of \$100 to the ton; and Mr. Holt says the ledge is about 20 feet wide and has been traced three miles. The rich rock is abundant, and teams had started up to commence a regular winter's work of hauling. Holt says the one company now working can easily keep his mill busy all winter, and promises to do so.

Full & Co. shipped, this week, 500 ounces of bullion from Winnemucca District. It contains a considerable percentage of gold, and is expected to assay at least \$2 the ounce. * * * The Manitowoc Company dispatched by Wells, Fargo & Co., Friday, 1,000 ounces bullion.

J. C. Fall is making arrangements to work the Agamemnon ledge. He acts in behalf of the Pioneer and Laskip Company, of New York.

Black Rock.

Correspondence of the Marysville *Appeal*, dated Susanville, Nov. 16th, has the following: The Black Rock region is attracting much attention at present, and is either the biggest thing or the biggest "hulk" in all creation. Judging from the appearance of the rock it would seem to be the latter; but judging from facts and figures, it is near the former as Washoe, if not nearer. The ore is extremely rebellious, the silver existing in a chloride state and defying the most experienced. It is of a kind rarely found. It resembles black, green and red wax. Some of it is variegated like Castile soap. It yields by mill process from \$40 to \$256 per ton. The leads are from three to one hundred feet in width, and some of the larger ones crop out thirty feet above the surface of the ground. A gentleman who visited the country informed me that a hundred million tons of ore could be taken from the leads at a cost of \$2 per ton.

IDAHO.

From the Owyhee *Avalanche*, of Nov. 10th: It is pretty well settled that the Morning Star mill will resume business soon under the management of W. L. Burnham and D. H. Jackson. As we are informed, the Vulcan ledge, a north extension of the Silver Cord, prospects exceedingly well, and shows a width of four feet, and there are already two hundred tons of good quartz ready to haul. Parties have contracted to take out quartz during the winter for a stipulated price, and Mr. Loucks is getting everything in readiness for a winter's work in the way of transporting it to the mill.

The same paper, in reviewing an article on "Eastern Capitalists and their mode of mining," makes the following remarks: "Eastern men, at first, don't seem to go at it as if to make a business of mining—a matter for years—but apparently throw their money out as bread upon the waters. They put their money and faith all in the hands of a person entirely unacquainted with any kind of mining, and

send him thousands of miles into the mountains to build a mill and open a mine; and if he don't do both in a year and have money left, he's an 'incompetent agent'—if not dishonest. The original capital is generally too limited, and the manner of expending it entirely wrong."

MONTANA.

From the *Post* of Nov. 10th: The first trial of Prof. Steitz's cupel furnace on ore from the Legal Tender lode, in Rattlesnake district, was a complete success. The ore was worked within a small fraction of the assay.

Letter from Helena to same, dated Oct. 29th, says: Work on the copper ledge discovered by McLaughlin and Dickerson, in the Muscle Shell country, is going on briskly. The ore will be shipped to the East. The average assay is 63 per cent. of metal.

Letter from Jefferson City, under date of Oct. 29th, has the following: In the Gregory, the vein has been struck at the depth of sixty-five feet, by tunneling a distance of 125 feet. The vein is six feet thick. The company will have a smelter in the spring. In the discovery claim, there is a crevice of four feet. Preparations are being rapidly made to prove other lodes—the Indiana, Corris Annie, Olive and others, all being of a similar galenic nature and assaying high.

From the Rocky Mountain *Gazette* of Nov. 10th: The McClellan Creek ditch is now completed. It is eight miles long, carries 200 inches of water, and the source of supply is inexhaustible. This renders an immense amount of ground available—gulch, hill and bar diggings. Several hundred men are now busily engaged on the ground covered by this ditch. There are many acres of wages paying ground not yet worked; but it is all claimed. Quite a promising town is springing into existence, in consequence of this new impetus given to business in Mitchell Gulch.

ARIZONA.

From the *Miner* of Oct. 13th: The Coulter quartz mill on Lynx Creek is fast approaching completion. It promises to be one of the best mills in the Territory, and its owners are full of energy. Mr. Hendy has introduced a bill in the council to repeal the chapter of the Howell code which contains the mining law of the Territory. Mr. Davis, of Mohave county, is said to be preparing a substitute.

John H. Marion, one of the prospecting party which left Prescott in July last, writes, Sept. 10th: "We have traveled over a vast extent of country, but, as yet have found nothing in the shape of gold. We kept too far north and east for that purpose. A portion of us, now, are going with a Mexican guide, to the White Mountains. He has lived long with the Coyotero Apaches, and says there is gold there. These Apaches are said to be peaceable."

From same of Oct. 27th: A. O. Noyes and George W. Curtis have procured a 10-stamp mill, which is on the road here, and destined for the Umpqua lode. With the mill they have two tons of extra shoes and dies, and all the fixtures to run the mill in the best style.

There was great rejoicing on the arrival of the steamer Esmeralda at Callville. O. D. Gass writes: "There are few aware of the anxiety of the people of Utah to hear of the success of this undertaking. Every inhabited valley and mountain hamlet will jump with joy to hear the glad tidings."

From the Wilmington *Journal* of November 17th: The Moss Mining Company, in Arizona, have fitted up their 10-stamp mill, which was expected to be in operation by the 15th inst. Quantities of extremely rich auriferous quartz were already at the mill, and still larger quantities were at the mine, awaiting transportation to the mill.

Arizona correspondence of the *Alta* of Nov. 13th, after alluding to the richness of the mines, and their neglected condition, at this time, even of those in the immediate neighborhood of the settlements, owing to the fear of Indians, adds: "Mines of great value are known to exist within the Indian country. Reports made by the few fearless adventurers who have penetrated into that terra incognita confirm the traditions handed down from the Padres, of the great wealth contained within the bosoms of these rugged Indian-guarded hills. But they will continue to lay, unprospected and unworked, until a sufficient military force is at hand to protect and assist in protecting the miners required to their proper development."

The schooner William Irelan, which arrived from the Colorado river on Nov. 17th, brought seventy tons of very rich copper ore from the Planet mine, on William's fork. There is another vessel with a cargo of ore from the same mine. Colorado river ores average nearly forty per cent. They sell here at \$110 to \$120 per ton, and cost about \$50 per ton on the wharf, \$20 of this being for freight. The Ashley Company have recently struck a very rich lode of ore in their drift. The Mineral Hill Company's smelting works are nearly completed.

COLORADO.

From the Colorado *Journal* of November 6th: The Smith & Palmer company are ship-

ping at the rate of 200 ounces per month. They have had a retort cast in turn out from 1,500 to 2,000 ounces of gold, which will doubtless be sent to the Exposition at Paris. . . . Mr. J. E. Leper has got his Keith mill at Empire started. The machinery works well. It has not yet been running long enough to make a clean up. . . . Richard Irwin has discovered a big argentiferous galena lode and called it Hollister. It crops out for nearly 2,000 feet in length, is eight feet between walls, with twelve inches of mineral almost on the surface. . . . Mr. Fitzpatrick's clean-up on October 30th weighed 211 ounces. . . . The American Flag company have raised the water out of their shaft and are now taking out a very fine quality of ore—iron pyrites and galena.

The Elk Company at Empire have been doing satisfactorily well during the last five or six weeks. They have gone down something like one hundred feet, and have struck iron, appearing to hear north instead of across the face of the mountain. . . . The Hopa Company are running their mill on poor ore and tailings, mixed, and are more than paying expenses. Their ore assays \$15 a ton as they take it out—\$120 a cord—and they get from \$95 to \$110 from it. They have let a contract to sink 100 feet in their deepest shaft, it already being 450 feet deep. . . . Hasbrouck & Co. have their tunnel driven at Argentine, 93 feet. At 103 feet they design to stop for the winter. Mr. Rothpletz will continue work on Quail creek through the season.

A new arrangement for amalgamating has been found to answer better than the shaking tables at the Keith Mill (Mammoth), saving six per cent. more gold. It consists of a set of three dolly-tubs discharging one into the other, then stationary, plain tables, like the old battery tables, and finally from seven to twelve feet length of blankets.

Mr. Ira Austin is opening a coal bank on Coal creek, about eighteen miles from Denver. He sunk a shaft thirty feet and is running south into a huge bluff, the vein now eleven feet thick, then a foot of mixed rock and very hard coal, then three more feet of coal, and growing gradually thicker as they go south. The lower three feet of the bed is almost as hard as anthracite, and the coal grows harder the further they get in. It sells at the mouth of the shaft for \$5 a ton, and the demand exceeds the supply.

From the Denver *News* of Nov. 7th: From present indications, the valuable and extensive discoveries made in the Snake River mining region, the past season, will induce a heavy emigration to that country in the coming spring. Miners returning from there for the winter are highly elated, and consider their fortunes sure. The great yield by assays made from lodes discovered there this year, is certainly very promising, and when we add to this the fact that these assays, running as high as \$2,800 per ton, were made only from surface quartz, there being no shaft over twenty feet in depth, all must admit that the hopes of the miners are well founded. The success, too, of the smelting works of Messrs. Whitney & Whiting adds to the strength and certainty of the belief in the glorious future of these mines. The great advantage of working the mines in this region lies in the ease with which tunnels can be driven into the steep mountain sides, striking lodes at a depth of thousands of feet from the surface without great outlay.

BRITISH COLUMBIA.

The *Oregonian* learns that about one thousand men have been in the mines of French Creek, McCulloch's Creek, and Carney's Creek, and the bars of the Columbia between Gold and Carney's creeks. Very few men have made expenses. The only creeks that have paid anything worth speaking of are French and McCulloch's, which are tributaries of Gold Creek. On all the streams upon which gold has been discovered, the bedrock is so deep that it cannot be reached without better appliances for protection against water. The number of men there a month ago was not probably more than two hundred and fifty. A few men will winter there, and perhaps another season be able to reach the bedrock of their claims.

BACKWARD CAPITALISTS.—The *Calaveras Chronicle* says: For a season the capital of the country was diverted to the silver ledges of Nevada, but there has been a reaction, and our moneyed men have become convinced that we have richer and more enduring mines on this side of the mountains than they have on the other. Capitalists stand ready to purchase a lead the moment it has been prospected sufficiently to demonstrate that it contains gold in paying quantities, but are loth to advance a few dollars to develop them. The man who is worth his thousands thinks that miners can afford to put in months of their time, and expend every cent they can possibly raise, to determine whether a quartz lode is valuable or not, and until the character of a mine is fully established, they obstinately refuse to assist the prospector.

Mining and Scientific Press.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.
 Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
 SAN FRANCISCO, Jan 11th, 1866.

San Francisco:

Saturday Morning, Dec. 1, 1866.

NOTICES TO CORRESPONDENTS.

S. P.—THE MINERAL, HUDSONITE? (1) recently so denominated by some New York mineralogists, will require to have its name changed to some other. For this purpose we would suggest that "ARGYLITE" be substituted—a similar mineral, both as respects its physical aspect and composition, having been first found in Argyleshire, Scotland, as described in our former notice of this substance. The Argyle, like the New York mineral, was of a very variable composition. When we previously noticed it, we accepted, without examination, the term applied by New York mineralogists, never suspecting that the title had previously been applied to another and quite different mineral, derived from the same locality. The latter fact ought to have been known to those who have thus misapplied the title, especially as they dwell in the vicinity of the place where the mineral was obtained to which the term *Hudsonite* was originally applied. *Hudsonite*, as described by various mineralogists, is a variety of pyroxene or angite, in which a considerable part of the silica is replaced by alumina. The present is one of the innumerable instances of the inconveniences which are continually occurring, from the custom of giving arbitrary names to minerals, in place of classing them under generic titles, and sub-classing them by names appropriate to their chemical composition. An improved order of nomenclature in mineralogy is imperatively required, in order to remove it from the empirical condition under which it has so long existed.

P. F., BUTTE COUNTY—THE DIAMOND AND THE TOPAZ.—Although your inquiry relates only to the former, we have appended a notice of the latter gem also, for reasons that will be easily gathered by a perusal of what follows. Professor Blake, in his notice of California minerals, mentions that the diamond has been found at Cherokee Flat, ten miles from Oroville, in well formed, highly modified crystals, from one-eighth to three-sixteenths of an inch in diameter, and generally of a pale straw-color; crystallization, tetrahedral. Considerable excitement existed some time ago respecting these rare gems being found in Idaho, some large specimens from that locality having, it is said, obtained very high prices in New York. There is no great improbability in either or both facts having occurred; though we are inclined to suspect that, in many cases, topazes are mistaken for diamonds; to which latter it not only approximates the nearest in hardness of any other gem, but also in brilliancy. These facts will be better appreciated, when we relate that we have now in our possession, for the inspection of the curious, a white topaz, brilliant cut, which, prior to its coming into the possession of the present owner, was one of several which was pledged to a London pawnbroker as a genuine brilliant, and subsequently formed the subject of investigation in one of the London Police courts. An inexperienced person would, unhesitatingly, pronounce the topaz in our temporary possession as a genuine brilliant. For the purpose of comparison, the owner of the topaz alluded to has also furnished us with one that is rough and unpolished. We are informed by the same gentleman, that at the London Exhibition of 1851, he had the opportunity of inspecting, along with Professor Tennant and Sir David Brewster, a very large white topaz crystal, rumored to have been obtained in California. The party alluded to, has, however, been much disappointed at never yet meeting with a topaz or any mineral here containing fluorine as one of its constituents. From their peculiar limpidity, topaz pebbles have been denominated by the French *gouttes d'eau*—drops of water. Topaz may be easily distinguished from the diamond, in consequence of cleaving into tables parallel with the base of the crystal.

PETROLEUM AND SPERM OIL AS LUBRICATORS.

An interesting series of experiments has recently been made on the Boston and Worcester and Boston and Maine railroads to determine the relative qualities and cost between petroleum and sperm oil as lubricators. The results are given as follows:

They put a railway carriage on each line in perfect order, calipered the journals and weighed the brasses, and used only sperm on one truck and only petroleum on the other, of each carriage. After running the carriage 19,000 miles, all the axles and brasses were found in good order, with equal wear all round, and 20 per cent. less oil had been used from the petroleum cask. They now use petroleum exclusively in the Lightner boxes of their carriages.

This oil, of the best quality, fully equal to pure sperm oil at the least, and probably better for carriage axles, can now be bought for about fifty cents per gallon, by the barrel, in New York; while sperm oil of a character to do the same work is worth over \$2 per gallon. It is said that the present daily supply of lubricating petroleum from Western Virginia alone is not less than 1,000 barrels per day. There is a large demand for the article for export, chiefly to England. Were the supply of petroleum to be cut off at the present time, it would work a most serious and damaging injury to the railroad interests and to heavy machine operations generally. The discovery of this quality of petroleum has been most opportune; indeed it is difficult to say from whence any adequate and sufficient cheap substitute could be derived. It is a matter of no little interest to know, as elsewhere shown in the present issue, that the supply is unlimited, and will probably continue to be so for all coming time. Sperm oil will also always have a market, and be maintained at a high price by the demand for it in various ways where petroleum and other oils cannot be used, particularly in woolen manufacture.

ERICSSON AND HIS INVENTION.—This distinguished engineer has recently been presented with the Rumford medal, as a testimony of the high estimation in which his mechanical genius is held. The medal was presented by Prof. Hosford, of Harvard University, who took that occasion to give a resume of his inventions and valuable discoveries. Ericsson built the first successful propeller having all its machinery below the water line—the Francis B. Ogden—which was rejected by the Lords of the Admiralty of England, on the ground that "it would be impossible to steer a vessel where the propelling power was so near the rudder." Mr. Ericsson came to this country, bringing the machinery of the Robert F. Stockton, and shortly after built for the Government the screw steamer Princeton. The idea of the monitor class of war vessels was conceived by Ericsson in 1854, when he submitted to the Emperor Napoleon a plan for such ships. Capt. Coles, of the English navy, detests his first idea in 1860. Capt. Ericsson is well known for his hot air engines, but his crowning glory is the total change in war ships, inaugurated by his celebrated Monitor.

MARIPOSA QUARTZ SPECIMENS.—Mr. Hunt who has just returned from a visit to the Mariposa county mines, has exhibited to us a magnificent specimen of quartz from the Josephine mine, on the Fremont estate. It is of triangular form, about eight inches in its greatest length, and is completely covered on one side with a spongy layer of gold, which is apparently about one-fourth of an inch thick. It was said to be a portion of a slab of about four feet long, which split in the middle, showing, in apposition, two surfaces of the kind described.

ARTICLES from California intended for the Paris Exposition will be too late for the Government vessels from New York, unless forwarded by the San Francisco steamer of December 10th, at the latest. Mineral specimens should be sent at once.

Electrical Phenomena.

EDITORS MINING AND SCIENTIFIC PRESS: I wish to call your attention to the fact that the *Alta* did not first promulgate the "modern" theory of earthquakes.* I wish to call your attention to the fact that the writer has previously enunciated the idea (in the *Alta* and San Jose Mercury) that earthquakes are occasioned by a sudden equalization of two currents of electricity—one being negative and the other positive. That by reason of the sun's attraction upon the earth's mass (the sun being positively electrical), a current of negative electricity is constantly flowing southwardly over and through the earth's surface. When this negative, sun-seeking current reaches the south pole, it assumes the positive or statical condition of the positive sun, and is therefore repelled, or driven northward; and as it cannot return by the path over which it came, it flows to the north, above the earth's atmosphere, and we can then see it returning to the arctic zone in the phenomenon of Aurora Borealis.

I wish to call your attention to the fact that I maintained, in the above mentioned journals, that the dry, vaporless atmosphere is a non-conductor of electricity; that, by reason of clouds and vapors floating into this dry non-conductor, a medium of conduction is established, and the upper and lower currents seek an equilibrium, and produce a local disturbance of the earth's surface, which we call earthquake. To demonstrate the proposition that an earthquake is nothing but an electrical shock, precisely like a flash of lightning, I constructed a machine to determine the fact. During the past seven months this machine has marked ten shocks of the earth accurately, and has established beyond a cavil that the electrical hypothesis is at least entitled to respectful consideration.

The objection which you urge in your issue of the 17th instant, that the velocity of electricity is "five hundred thousand times the speed at which the earthquake-wave travels," is easily set aside. As above stated, an earthquake is merely a local disturbance at any point of the earth's surface, occasioned by the sudden equalization of the positive and negative, or upper and lower currents of electricity. The oscillatory or "wave motion" of the earthquake is merely momentum, imparted to the earth's material by the sudden local concussion. The radius or extent of the wave will be in exact proportion to the violence of the local disturbance. Yours respectfully,

W. FRANK STEWART.

REMARKS.—We cheerfully insert the above communication from Mr. Stewart, and shall be glad at all times to receive from him any well digested synopsis which he may deem calculated to illustrate the truth of his theory. Mr. S. will, however, please to bear in remembrance that, in the present state of science, no opinion is considered as even tolerably established until all anomalous phenomena are explained. The value of the machine alluded to by Mr. Stewart, and the inference to be drawn from its action, will depend much upon the soundness of the principles on which it is based. If founded on a correct theory, and regular and accurate observations noted, there can be no doubt but such a machine may become a valuable means of illustrating any coincidences which may occur between earthquakes and electric disturbances. To be of practical use, however, it will be indispensably requisite that all phenomena which tell against the electrical theory of earthquakes (if such should occur), should be recorded with the utmost fidelity. We presume that Mr. S. would explain away the effect of our allusion to the difference of speed at which electricity and the earthquake wave travels by the inferior conductive power of the earth's crust as a medium. Fully admitting that fact, we must, however, remark that in ordinary telegraphy, the theory is that the return current between the two distant stations is conveyed through the medium of the earth's crust, and at a rate greatly exceeding that of the motion occasioned by the earthquake waves.

* See T. F. Mackintosh's "Electrical Theory of the Universe."

DOUBTFUL.—It is said that an Austrian chemist has discovered a method of inclosing electricity in glass capsules, which may be enclosed in steel cases, to be used as balls for rifles, and that such projectiles when fired into a fleshy body, as of an enemy, in battle, will explode by the impact with sufficient force to kill. They would be much more likely to kill at the other end, by exploding in the gun barrel at the instant of the discharge. Altogether the thing looks rather fishy.

THE PARIS EXPOSITION.

The Paris Exposition Committee are making active exertions to secure a proper representation of California at the coming World's Fair. Collections are constantly coming in, and the committee are holding frequent meetings. Prof. Blake, the State Commissioner, is also making active personal efforts in the same direction. At a late meeting of the Committee he submitted, through it, the following address to the citizens at large, and to the miners in particular:

The Commissioner of the State of California to the Universal Exposition at Paris in 1867, submits the following, through the World's Fair Committee, to the People of the State:

Presuming that the magnitude and importance of this coming Exhibition are understood and admitted, and that we appreciate the opportunity it offers to California to make its resources known to the world, the question arises how shall we avail ourselves of the opportunity and derive the greatest advantage from it?

Of the Commissioners appointed by the President and Senate to represent the United States, but one is from the Pacific coast—the exception being from Oregon—and it is believed that neither of them is personally familiar with our State and its resources. The responsibility of the representation and elucidation of our resources will therefore naturally and inevitably fall upon your Commissioner. His presence there will not be a mere matter of form, he will not be a mere spectator, he will by force of circumstances occupy a position different from that of Commissioners from other States, whose productions and interests are more fully blended and inseparable than ours are or can be with theirs. He will be expected to be present before the opening of the Exhibition to attend to the interests of California, to direct and assist in arranging her products, and to constantly give information concerning them.

I propose, in the first place, in addition to what has already been done, to secure a systematic and thorough representation of our mines and minerals by personal exertion. To this end I take from five hundred to one thousand characteristic specimens from my collections, and will shortly visit and collect at Grass Valley and other prominent mining sections. It is only by personal exertions that a proper collection can be made. In order to call the attention of mine-owners to this matter, and secure their co-operation, I will issue a circular, stating what is required, and correspond directly with those mines I cannot visit.

The Secretary of the State Agricultural Society will send a very full collection of our agricultural products, so that this branch of our interests will not be neglected. On reaching Paris, these collections will be properly arranged and displayed to the best advantage. If provided with the means, I then propose—

First—To prepare and publish a small volume, setting forth in plain, direct language, the nature and abundance of our resources, and the advantages we can offer to the immigrant and to capital. In such a volume, our climate, soil and agricultural productions would be described; the quantity and price of our public lands, the cost of living, rates of wages, and the ways of getting to the State would be made known. The statistics of the production of our prominent mines would be given; in short, the volume would include just such information as the capitalists and masses of Europe would most desire for an intelligent comprehension of our condition. This volume should be printed in English, French and German, and be judiciously distributed.

Second—To give public addresses or lectures in French as well as in English in the great hall to be provided for that purpose, and to illustrate these by maps and drawings and reference to our collections.

Third—I hope not only to give but to receive information of value and importance to the various interests of our State; such information, for example, as may enable us to improve in the metallurgical and mechanical treatment of our ores, in the manufacture of wines, oils, and in mechanical arts and processes generally.

The circular referred to is as follows:

TO THE MINE-OWNERS OF CALIFORNIA AND ADJOINING STATES.

In the coming Universal Exposition at Paris the mines and mineral resources of Europe will be thoroughly and systematically represented by series of specimens collected and classified by the members of the various corps of mining engineers. The specimens will be in suites, representing all varieties of the ores and all the various stages of the processes for the extraction of the metals. The copper and lead ore, for example, will be shown in their various degrees of fineness, and be accompanied by samples of the matte, regulus, and the slugs, together with the fluxes used. The specimens will be neatly trimmed, so as to be as nearly as possible of uniform size, so that when arranged

in cases the best and most pleasing effect will be produced. California, and the Pacific coast generally, should be fully represented in a similar manner. We only need to make a fair exhibit of our various metals and minerals to carry conviction, on sight, to all visitors at the Exhibition of our vast and varied mineral resources. We must be careful that in point of excellence of specimens, in the completeness of illustrative series, and in the scientific and effective arrangement of the whole, our exhibition of minerals shall do justice to the magnificence of our veins and to our appreciation of their character and value. How is this to be accomplished? Specimens selected at random will not answer the purpose. One here and another there, although better than nothing, will not give us the illustrative series that we need. Each mine of importance should be represented by from six to twelve specimens, nearly uniform in size, and with clear, fresh surfaces. These should include the chief varieties of ore and pieces of the foot and hanging walls.

The Commissioner is aware, from past experience in forming collections, that specimens of the desired character are rarely obtained, except by personal application and exertion at the localities. He therefore proposes to commence a collection by taking a portion of what he has already collected for his own cabinet, which, through the uniform liberality and courtesy of the miners of the State, is already large, and to extend the collection by again personally visiting the northern mines, Grass Valley, and the line of claims upon the "Mother Lode," southward toward Mariposa. He relies upon his numerous friends to assist him in this work, and hopes to receive from such mines as he has not already visited full illustrative specimens.

Specimens in general should not be larger than the two fists; each should be well wrapped in paper, and have a distinct label placed inside. Samples of blanket sands, the cleaned sulphurets, and of the tailings should accompany the quartz specimens; one pound of each is sufficient.

Persons sending specimens will please state distinctly what disposition they wish to have made of them at the close of the Exhibition, and as no funds have been provided for the payment of freight to this city, parties will please prepay, or first correspond with the Commissioner on the subject.

WM. P. BLAKE, Commissioner.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

Mr. JOHN WASSON, of the Owyhee *Avalanche*, of Silver City, Idaho, has contributed a valuable lot of specimens from the Poorman mine, Idaho. No. 110 is a very fine specimen, carrying both sulphurets and chloride of silver, and showing considerable free gold. This specimen is somewhat remarkable in its characteristics, containing a mineral piercing the general mass, in various directions, and in small stegastic forms—probably a sulphate of lime. No. 111 consists chiefly of sulphide of silver, and will probably yield about 60 per cent. of pure silver. No. 112 contains a small crystal of pure chloride of silver, of a violet blue, and of a waxy consistency, such as may be easily indented with the finger nail. A somewhat brittle variety of this description of mineral often occurs in this mine in large sheets, several inches across, either way, and not thicker than ordinary window glass. A dark red variety of ruby silver ore, known as "pyrrargyrite," also occurs in this mine. This mineral contains a large percentage of antimony.

Mr. Wasson has also contributed several specimens of ore from Flint district, some eight miles south of the Poorman, which consists of an antimonial sulphuret, very much resembling that class of ore found in the Humboldt region. No. 113 is a sample of this ore, unchanged, and evidently taken from a considerable depth in the mine. No. 114 appears to be the same class of ore from the surface, very much decomposed and quite fragile in character. This we understand to be a new district, in which explorations have but recently commenced. No. 115 is from a ledge recently opened about 100 feet east of and parallel with the Poorman. We are not aware that any examination has been made to ascertain the character of the vein. The specimen before us would pass for an ordinary sample of California gold-bearing quartz containing a small percentage of sulphurets.

MINERALOGICAL NOTICES.

At the last meeting of the California Academy of Sciences, Professor Blake submitted the following interesting mineralogical notices:

KERAROVYRITE—Chloride of silver, in remarkably fine specimens, occurs in the Poorman lode, Idaho, associated with *proustite* (light red silver ore), native silver and native gold. Sheets of the chloride are taken out of the soft clay of the vein, and are from one-eighth to one-quarter of an inch in thickness. It is also found in irregular massive aggregations of crystals, in cubes, without any modification, and over one-eighth of an inch square. The color of my specimens is brown, passing into violet blue in some portions.

PROUSTITE—The ruby silver, which occurs with the chloride in the Poorman lode, as above, is often found in masses of several ounces or even pounds in weight, and it is reported to be occasionally seen in beautiful crystals, but none have yet come under my observation.

COPPER GLANCE, RED OXYD OF COPPER, NATIVE COPPER—These specimens are found together in the Red Cup claim, Klamath county, in serpentine. The metallic copper is seen in points throughout the massive sulphuret, and is sometimes enveloped in red oxyd. Both copper and oxyd are most abundant in the outer portions of the ore as found, and they are apparently formed by the gradual decomposition of the sulphurets.

DANAITE—A cobaltic variety of mispickel, is found associated with iron and copper pyrites, in Excelsior district, Nevada county, California. It occurs in distinct, well formed, brilliant crystals, of a tin-white color, and about a quarter of an inch in diameter. They are modified nearly as in figure 289 of Dana's *Mineralogy*. This mineral gives cobalt reactions before the blow-pipe, and appears to contain a large quantity of this metal. The ore is said to contain nickel also, and is being mined for shipment.

CINNABAR IN CALCITE—Cinnabar of a beautiful vermilion color is found in an unusual form in Idaho, being abundantly spread throughout a gangue of massive, compact limestone or marble. It is so compact and homogeneous, that specimens may be cut and polished like marble. There are no evidences in the ore that I have received, of the presence of other minerals, not even of quartz.

A New Mode for Working Silver Ores.

Mr. A. Hunter, the inventor of Hunter's Concentrator, has presented for investigation the following cheap mode for working sulphureted silver ores, which is certainly worthy of careful consideration by all persons engaged in silver mining. That quite too large a percentage of loss is unavoidable from the present mode of working low-grade ores, is universally acknowledged. The only reason assigned for continuing that wasteful mode is the great cost of submitting the entire mass of the ores to the fire process. By a cheap method of concentration, by which only the sulphurets need be roasted, this expense must be materially reduced and a large increased gain realized. The economy of the idea rests wholly in the cost and efficiency of the *concentrators*. Will not some of our enterprising silver workers try Mr. Hunter's plan, and report results? We have long had confidence in such a mode of working both silver and gold ores. It is now being generally adopted by our gold miners, much to their advantage. We see no reason why it may not be made equally as serviceable in silver mining. It is worth a trial at all events. Mr. Hunter says:

For reducing the ore, use the ordinary battery and a No. 6 screen; concentrate in front of the battery, and as the sand passes off from the tables pass it over a fine screen of No. 80 or 6,400 meshes to the square inch. The water and slum pass through the screen, and are run into tanks and settled. The only machinery necessary for the above process is the ordinary battery, concentrators, and a few amalgamators for working the slum. The sulphurets of ordinary silver ores, when concentrated, will average about five per cent., or 100 tons will give five tons of sulphurets. The following is about an average cost of reducing,

concentrating and working the sulphurets and slum:

For reducing and concentrating 100 tons of ore at \$5 per ton.....\$500 00
For roasting and working five tons of sulphurets at \$40 per ton.....200 00
For working the slum.....50 00
For working 100 tons of ore.....\$550 00

Making \$8 per ton for extracting at least 80 per cent. of the silver contained in the ore as per fire assay, and scarcely any waste of quick-silver. By the ordinary process now in use for low-grade ores, extracting only about 60 per cent. of the fire assay, the cost for working is about \$15 per ton; and for high-grade ores, where 80 per cent. is guaranteed from the fire assay, the cost is from \$35 to \$45 per ton. The difference of the cost of working and the cost of machinery is easily calculated, and the thousands of tons of low-grade ore that would not pay to work, will prove highly remunerative for the capital and labor expended by the use of the above process.

LIST OF OFFICERS OF CORPORATIONS AND MINING COMPANIES.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

[Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona-fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

CONFIDENCE S. M. Co.—November 9th. Trustees: George W. Stewart, Wm. Sarryhue, Fred. Collier, Wm. L. Palmer, S. B. Whipple. President, Geo. W. Stewart; Vice President, S. B. Whipple; Secretary and Treasurer, R. Wegener; Superintendent, John Nelson.

GOLD QUARRY M. Co.—November 23. Trustees: A. C. Penchy; D. Maynard; Geo. D. Roberts, E. Wertheman, Jos. Freeborn.

HOPE GRAVEL M. Co.—November 15. Trustees: H. J. Paine, George E. Hinckley, W. A. Bateman, Lewis Teese, Jr.; C. W. Ham. President, H. J. Paine; Secretary, David Wilder; Treasurer, Geo. E. Hinckley; Superintendent, Samuel Locke.

MOUNT TENABO S. M. Co.—November 22. Trustees: Lucius A. Booth, Joseph Sedgley, J. Preston Moore, Thos. Hardy, Jamee Dows. President, Joseph Sedgley; Secretary, R. N. Van Brunt.

RECENT INCORPORATIONS.

SAN JOAQUIN VALLEY CANAL Co.—Fresno, Merced, Stanislaus and San Joaquin counties. Capital stock, \$1,000,000; 10,000 shares; \$100 per share. Trustees: William B. Carr, Wm. H. Graves, Benj. H. Dyer. Nov. 14.

SIERRA MAMMOTH M. Co.—Sierra county. Capital stock, \$300,000; 30 shares; \$10,000 per share. Trustees: Joseph Clark, Alexander E. O'Neal, George Hearst. November 16.

REESE RIVER MINES.—We would call attention to our mining summary under the head of Reese River. The *Reveille* has made, from time to time, an eloquent appeal to capitalists, urging with force upon the public the extraordinary wealth of the newer districts in southern Nevada. We can only make brief extracts.

Air Pump for Sale.—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to Jones Reacher, mathematical instrument maker, 522 Montgomery street. 21v13-9p

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10

HUNTER'S

IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

ANDREW HUNTER, Inventor, San Francisco.

ROWLAND, WALKER & CO.,

Grocers,

Nos. 516 and 518 Washington street,

Are offering a complete assortment of GROCERIES at the LOWEST RATES. Quality guaranteed.

Goods delivered at any point within the city limits. 21v13-1y

PATENT HYDRAULIC HOSE SEWING

By S. HOWARD,

No. 326 DAVIS STREET, San Francisco. 21v13-3m

STRONG & CO'S

CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator; has double Mullers, Rolling Stones and reverse action.

Millmen and others are respectfully invited to examine this Pan, before purchasing others, as it gives the best satisfaction. Can be seen in operation daily at the San Francisco Foundry, Fremont street, near Mission. Ores, in lots not exceeding 2,000 pounds, tested by 21v13 G. W. STRONG, Assayer.

The People's Friend!

Perry Davis' Vegetable Pain Killer, THE GREATEST FAMILY MEDICINE OF THE AGE! Taken Internally, it cures sudden colds, coughs, etc., weak stomach, general debility, nursery sore mouth, canker, liver complaint, dyspepsia or indigestion, cramp and pain in the stomach, bowel complaint, pilgrims' colic, Asiatic cholera, diarrhoea and dysentery. APPLIED EXTERNALLY, cures felons, boils and old sores, severe burns and scalds, cuts, bruises and sprains, swollen joints, ringworm and tetter, broken breasts, frost-bitten feet and chilblains, tooth-ache, pain in the face, neuralgia and rheumatism. It is a sure remedy for Ague and Chills and Fever. 21v13-1t

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rags, Screw and Drop Presses, Coining Machinery, File Drivers, Bark and Salt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Fire, Tubular, Upright, Cylindrical and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenos' Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Astra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Grinding Batteries, or machines with the latest improvements, every variety of Stumps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash price.

D. CAMERON.

A NEW BLANKET PROCESS.—A somewhat
novel system of concentrating with blankets
has recently been introduced by Mr. Thomas
Coogh, of Falmouth, England, which is de-
scribed as follows:

The chief feature in the invention consists in
the use of brushes passing over the blankets, to
insure the regular distribution of the sands or
slimes in course of treatment. The sands are
concentrated on blankets or skins nailed on an
inclined table, supported upon trunnions, one
at the head and one at the foot. The head
may be raised or lowered at pleasure, according
to the gravity of the sands under treatment.
An endless chain, carrying a series of brushes,
revolves continuously above the table, the
brushes preventing the light weight from set-
tling on the skins and stopping the fine parti-
cles of gold from passing off with the water.
When the blankets or skins become filled with
sand, the head of the table is lowered to a
horizontal position, and the table is then turned
over, so that the concentrated sand may be
washed off into the trough beneath. The time
required for turning the table, washing it and
re-turning it ready to commence washing, is in-
appreciable. Mr. Coogh has also invented an
improvement upon the barrel amalgamator,
which consists in counting four or any other
equal number of barrels endwise upon an axis,
so that balancing each other, they can be
turned with great facility. The amalgamation
is effected in the ordinary way, and arrange-
ments are made for filling the barrels through a
hopper, and discharging them by a plug.

THE CONSTITUTION OF SIRIUS.—Father
Secchi has sent to the Academy of Sciences
of Paris an account of the spectra of some
stars, as recently seen by him in a new spec-
trometer by Merz, with a prism by Hoffman,
of Paris. A drawing of the spectrum of
an Orionis accompanied the communication.
The spectrum of Sirius is described by the
learned author as resembling that of sulphur.

OIL FROM SHALE.—Large quantities of shale are now being mined in England for the production of petroleum by distillation. More than 150 retorts have lately been set to work in North Staffordshire. Extensive works are also in progress of erection in Derbyshire and Yorkshire. All the old works in Flintshire are actively engaged in distilling canal coal and shale; and in addition to the old works in Scotland engaged in working Torbanehill mineral, quite a number of new ones are being constructed, or have already started. Similar works are also in operation in the Atlantic States and in California, and the probability is that the chief yield of petroleum will yet be derived from the shales and sand rather than from wells. California may therefore take heart, and feel confident in her ability to compete successfully with any part of the world in this class of petroleum product.

Bell's Assay Office.

THE UNEXPERIENCED, HAVING FORMED A PARTNERSHIP this day, would inform the former partners and the public generally, that they will continue the ASSAY BUSINESS in all of its branches, at the old stand,

No. 512 California street,

One door west of Montgomery, San Francisco, with the same employees, under the name of Rogers & Brown.

MR. EDWARD WOLLEB, for the last seven years Assayer for Mr. Bell, will have charge of the Assay Department.

The Melting Department will be under the charge of MR. HENRY J. FISHER, for ten years in the United States Mint in this city and Philadelphia, and for the past seven years with Mr. Bell.

We would inform Photographers that we are prepared to work their chloride of silver and ashes from their paper clippings.

We have, in connection with our Assay business a MILL, and are prepared to

WORK GOLD AND SILVER ORES,

In quantities from 25 to 500 pounds; also, Assayers' Sweeps.

GEORGE E. ROGERS,
H. W. BROWN.

Rheumatism!!

ANOTHER WITNESS!

H. BOWMAN—DEAR SIR: HAVING HAD A FAIR test of the virtues of RICHARDS' REMEDY FOR RHEUMATISM, I take great pleasure in stating that its effects with me have been even better than its commendations claim. In 1863 I first heard of the Medicine. I had then been for three years severely afflicted with Rheumatism, and having tried everything I could hear of, without any permanent benefit, I concluded to try this also.

On taking the medicine, in three days I experienced great relief, and in one week was entirely free from pain, and had completely recovered the use of my limbs, which had become almost powerless, so much so that I could not dress myself without assistance. Since that time I have been free from Rheumatism. I have recommended RICHARDS' REMEDY to numerous friends, and in every case it has proved successful. I therefore take great pleasure in recommending it to all who are afflicted with Rheumatism, and especially to all mercurial chronic Rheumatism cases.

Yours respectfully,
(Signed) ERASTUS PARSONS,
President of the Gen. Grant Mining Company.

RICHARDS' REMEDY is for sale by
H. BOWMAN,
Druggist, Sacramento. 15v13

Important to Californians.—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed or even defeated by the neglect of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press, Editors Anderson has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

Pacific Law and Collection Office

—OF—

W. H. ALLEN,

Attorney and Counsellor at Law,

Principal Office at Rooms 11, 12 and 13 Amory Hall Building.

502 Montgomery Street, San Francisco, Cal.

Agencies at every City and Town on the Pacific Coast. Collections guaranteed with or without suit in all the cities and counties of the Pacific and Atlantic Coasts.

Legal advice will be given free of charge until after 1st January, 1867. Postage on letters asking advice must be paid both ways. 8v13-3m

REMINGTON'S ARMORY.

Agency, 310 Washington st., San Francisco.

All the new models for sale very low. 12v13tr

ALBERT E. CRANE.

Treatment of all Deformities of the Body, by DR. A. FOLLEAU'S process. 624 Washington street, up stairs, Washington Baths Building, between Montgomery and Kearny streets.

DR. A. FOLLEAU

Has his studios and manufactories in the same building. Every kind of Apparatus, Trusses, Orthopedic Instruments, Artificial Limbs, etc., are manufactured and supplied by himself.

He has no connection with any Agency. 8v13-151p

BROWN & BEADLE,

Offer their services to

INVENTORS AND THEIR ASSIGNEES,

—AS—

PATENT SOLICITORS.

They will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to them for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as Attorneys in presenting Applications at the Patent Office, and in managing them to a final issue; will draw up Assignments, will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable, and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D.C. 7v12-3m

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

CONNECTICUT

Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS.....\$12,000,000.

THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,
The Largest Amount Insured,
The Largest Surplus,
The Largest Business,
The Largest Income.

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT. of the premiums paid during the year ending 31st of January, 1863.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies to which Life Insurance is applicable, among which forms are—

Whole Life Policies, by a continued annual life premium.

Whole Life Policies, by TEN annual premiums.

Endowment Policies, by a continued annual premium.

Endowment Policies, by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give a note in part payment of the premium, but may, if preferred, pay the first four premiums in cash after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums one-half. When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be applied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

DIRECTORS:

JAMES GOODWIN, GEORGE S. GILMAN, MARCUS F. HODGES, N. M. WATERMAN, E. B. WATKINSON, Z. PRESTON, HENRY C. ROBINSON, GUY R. PHELPS, E. D. TIFFANY, CHARLES F. THAYER, JOHN C. PALMER, THOMAS SIBSON.

GUY R. PHELPS, President.

Office, N. W. corner Montgomery and Sacramento streets, San Francisco. 17v13 p11

Accidental Insurance!

The Accidental Insurance Company

OF NEW YORK.

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident.

In case death does not result from the injury, the insured receives a weekly compensation as long as he is disabled (not to exceed twenty six weeks).

ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in tenths of the Annual rate, as follows:

1 month, 2-10.	4 months, 5-10.
2 " 3-10.	5 " 6-10.
3 " 4-10.	6 " 7-10.

GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices through the country.

They make Insurance for \$5,000, and \$25 per week compensation, against Accidents of every description, Traveling or otherwise; good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident to the Public conveyance in which the insured may at the time be traveling," but they are GENERAL ACCIDENT TICKETS.

SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and other Ports. Rates varying with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with Wm. Barnes, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

INDUCEMENTS.

The rates of Premium are very low. The Plan is so simple that any one can comprehend all its workings.

No MEDICAL EXAMINATION is REQUIRED, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory use can be made of so small a sum.

For Policies or further information, apply to

 FARGO & CO.

The splendid steamship **COLORADO** will be dis-
 patched for CHINA on TUESDAY, January 1, 1887.

For passage and all other information, apply at the Pa-
 cific Mail Steamship Co's office, corner of Sacramento and
 Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

Delays are Dangerous.—Inventors on the Pacific
 Coast should bear in mind that by patronizing our Patent
 Agency they can sign all necessary papers for securing pa-
 tents almost immediately, thereby avoiding the three
 months' delay requisite in transacting business through
 Eastern agencies.

Postage.—The postage on the MINING AND SCIENTIFIC
 Press to any portion of the United States is twenty cents per
 annum, or five cents per quarter, payable in advance at the
 Post Office delivering the paper. Postage free in the city and
 county. Foreign postage (with few exceptions) two
 cents per copy, prepaid. To Bremen and the German
 States (marked via Bremen and Hamburg line), three cents
 per copy, prepaid. Single copies to any address in the United
 States, two cents.

DR. A. HARTMAN,
Electro-Magnetic Physician,
CURES ALL CURABLE DISEASES, BY THE CON-
 centration of the force for the cure of the most dis-
 cure. The mind made to see, the ear to hear, the lame
 made to walk, and the sick healed. Come and see the im-
 mense power of the force. They will speak for themselves. The
 poor treated free from 10 to 11 A. M. and 4 to 5 P. M. Operat-
 ing rooms, **Crim House**, 523 Kearny street, between Sacra-
 mento and California. 21v13ca

Postponements and Alterations.—Secretaries are
 requested to give notice of postponements, or alterations
 which they may desire made in their advertisements at
 their earliest convenience. New advertisements should be
 sent in as early as possible.

Illegal Supplemental Advertising.—It
 would be well for Mining Companies, whose advertise-
 ments are repeatedly appearing in the Supplements of
 daily papers, to inquire into the legality of that class of
 advertising.

THE MINING AND SCIENTIFIC PRESS, published weekly, in
 San Francisco, California, by Dewey & Co., is one of the
 oldest and most valuable papers published in the "Golden
 City." Mining is its specialty, but it is full of a variety
 of scientific and valuable information. Subscription price
 is only \$5 a year. [Philadelphia Mining News.]

WORDS FOR MINERS.—The Gold Hill Daily
News, Nevada—a medium of good authority—
saith thus:

THE MINING AND SCIENTIFIC PRESS is a weekly journal, pub-
 lished in San Francisco, which is entitled to the subscrip-
 tion patronage of every practical miner in Nevada, and
 every person interested in Nevada or California mining
 operations. It is a well gotten up sixteen-page quarto;
 and its reading would tend vastly to the particular "post-
 lag" and general enlightenment of our sort of working
 folks. Subscribe for it. Five dollars a year; three dollars
 for six months. It should have an agency in Virginia and
 Gold Hill; but we see none advertised in its columns.
 Every new improvement in mining implements and
 operations are fully described by words and illustrated by
 wood cuts in this excellent publication. A specimen num-
 ber can be seen at our office.

New Mining Advertisements.

Chilpaneca Mining Company—District of Ures,
 Sonora, Mexico.

Notice.—There are delinquent, upon the following de-
 scribed stock, on account of assessment levied on the
 thirty-first day of October, 1886, the several amounts set
 opposite the names of the respective shareholders as fol-
 lows:

HALL'S SARSAPARILLA, YELLOW DOCK AND IODIDE OF POTASS.

THE BEST BLOOD PURIFIER KNOWN.

Persons that are troubled with Rheumatism, Scrofula, Neuralgia, Morbid Liver, Salt Rheum, Pimples, Boils, or any of the many diseases that originate from Impure Blood, would find it much to their advantage to give this justly celebrated article a trial. One or two bottles are quite sufficient to convince the most skeptical of its merits. It contains neither Spirit, Arsenic nor Mercury, which cannot be truly said of any other preparation called "Sarsaparilla."

ALLEN'S LUNG BALM!

For the Cure of Consumption and all Diseases of the Lungs.

This Balm is introduced to the suffering public after its merits for the cure of all diseases have been fully tested. The formula from which it is prepared is referred to by the leading medical journals as being equal to any prescription that can be made up, for such diseases, by the medical faculty. The BALM is, consequently, recommended by physicians who have become acquainted with its great success. As an expectorant it has no equal. DR. A. SCOVILLE, who has, for many years, been known to the public throughout the United States as the inventor of remedies for the lungs, recommends ALLEN'S LUNG BALM as surpassing anything that has ever been offered to the public for the cure of Lung Disease. He declares that he has used it with great success in the case of his sister, who was supposed to be in the last stages of consumption. This lady is now well, and has been permanently cured by Allen's Lung Balm.

To Owners of Mineral Cabinets.

A miner in Nevada has a lot of choice Crystals, which he desires to dispose of at reasonable rates to parties who may desire to complete their display of minerals. Address the office of the "Mining and Scientific Press." 19v13-1fc

Mining Notices-Continued.

Arbitros Mining Company, Bontopline District, State of Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of October, 1886, an assessment (No. 12) of one dollar and a half (\$1.50) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 311 Montgomery street, up-stairs, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the fourth day of December, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the twenty-second day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. MARTINSON, Secretary,
Office, 311 Montgomery street, San Francisco, Cal.

N. B.-Until further notice, all advertisements of this Company will appear in the "Mining and Scientific Press." n43

Chaparral Hill Gold and Silver Mining Company, Albany Flat or Hill District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventh day of November, 1886, an assessment of fifteen cents (15c) per share was levied upon the capital stock of said Company, payable on the fifteenth day of November, 1886, in United States gold and silver coin, to the Secretary, A. de SENAHLAC, at the Company's office, 606 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the tenth day of December, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirty-first day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. de SENAHLAC, Secretary,
Office, 606 Montgomery street, San Francisco, Cal.

Colorado Silver and Copper Mining Company.

Notice.-The Annual Meeting of the stockholders of the Colorado Silver and Copper Mining Company, will be held at the Company's office, No. 523 Clay street, San Francisco, on MONDAY, December 24th, 1886, at 3 o'clock P. M., for the election of Trustees, and the transaction of such other business as may properly come before it.

n40-4w B. W. MUDD, Secretary.

Del Norte Comstock Company, Low Divide District, Del Norte County, California.

Notice is hereby given, that the Annual Meeting of the shareholders of the above named Company will be held on MONDAY, the third day of December, 1886, at 7 1/2 o'clock P. M., at the office of the Company, No. 331 Montgomery street, San Francisco, for the election of Trustees to serve the ensuing year, and for the transaction of other business.

R. N. VAN BRUNT, Secretary,
San Francisco, November 16, 1886. n40

George Washington Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.-Assessment No. 15.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of November, 1886, an assessment of two and one half dollars (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, caly.

Any stock upon which said assessment shall remain unpaid on the eighth day of December, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fourth day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. G. WOOD, Secretary,
Office, 338 Montgomery street, San Francisco. n40

Great Central Mining Company.-Location of Works: Yuma County, Arizona Territory.

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of October, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on the sixth day of December, 1886, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOS. GOLDMAN, Secretary,
Office, 318 California street, up stairs, San Francisco. n40

Mineral Mountain Gold and Silver Mining Company, Carson's Flat or Hill District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of November, 1886, an assessment of ten cents (10c) per share was levied upon the capital stock of the said Company, payable on the fifteenth day of November, 1886, in United States gold and silver coin, to the Secretary, A. de SENAHLAC, at the Company's office, 606 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the tenth day of December, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirty-first day of December, 1886, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Lega; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to this same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of this Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** 1st St. San Francisco.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by **KNAPP & GRANT,** 310 Washington Street, San Francisco, where persons desiring to use water-power can be supplied. These wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to **KNAPP & GRANT,** also, San Francisco.

Leffel's Lever Jacks, For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by **KNAPP & GRANT,** 310 Washington Street, San Francisco.

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG, 310-312 Clay Street, below Davis.

American and Foreign Patents.—Letters Patent for Inventions can be secured in the United States and foreign countries through the **MINING AND SCIENTIFIC PRESS PATENT AGENCY.** We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Plastic Slate Roofing.

The composition and utility of this new material for roofing, which was noticed at considerable length in our issue of September 22d, is thus referred to by a correspondent writing from New York, under date of October 23d:

EDITORS PRESS:—In looking over your valuable paper, of which this company is a subscriber, I see a notice of the new roofing material called "plastic slate." Their office joins our own, and I have had many opportunities for ascertaining facts concerning this new invention, and can testify that what you say is *all true*, but not *all the truth*. I had the pleasure, a short time since, of being in their rooms at a stockholders' meeting, and listened with interest to the experience of the different licensees, all of whom concurred in the one belief, that it is the *best* roofing material known, and has only to be used in a city, town, or neighborhood, and shown, to constitute it the favorite. There has been some delay occasioned by the inability of manufacturers to supply the materials (slate, flour and felt) as fast as called for. This is, however, being remedied very fast; mills are going up in all sections of the country. Speaking of the good qualities, I can speak understandingly. I have seen the roofs, heard parties baving them on their houses speak, and as to its being *fire-proof*, I have taken a piece and laid it on a bright fire, in a coal grates, and kept it there until *red hot*, and when taken off and cooled, presented the appearance of a sheet of slate, such as is used in our common schools. There is no question but that it is an entirely wind, water, and fire-proof roof, as well as the cheapest in the world.

Our correspondent has forwarded several samples of this new roofing material, from which a very good idea of the character of the same may be formed. One of the sample has been exposed for eighteen months upon a roof. These specimens may be seen at the office of the **MINING AND SCIENTIFIC PRESS**, where, also, further information may be obtained relative to the terms on which capitalists may obtain the patent right for this invention on the Pacific coast.

COLORADO RIVER.—The Salt Lake Telegraph, of November 1st, has the following:

We had yesterday the pleasure of a visit from S. Adams, Esq., who, with Captain Trueworthy, was here last summer, eliciting the interest of our merchants and business men in the opening of the Colorado river. Mr. Adams is direct from Callville, and brings us intelligence that a steamer had passed up the Roaring Rapids—the bug-bear of the monopolizing company—consuming only seven minutes in the transit, the distance being 120 yards, with some four feet fall. The obstructions, which, it had been represented to Congress, would take \$150,000 to remove, Mr. Adams says he is willing to contract to remove for \$1,500.

The river, he has not a doubt, will be navigable at all seasons of the year, and its opening is now regarded as a substantial fact.

To demonstrate the practicability of a passage through the celebrated Black Cañon, ten miles long, a short distance above Callville, Mr. Adams threaded his way up along the river banks to the head of the cañon, and went down on a small raft. He returned, satisfied that the river pass through the Black Cañon was navigable, and further states that for forty or fifty miles above the head of Black Cañon, he saw an open country, giving almost definite assurance that steamers will be able to pass seventy or eighty miles above Callville, thus, of course, lessening, by that number of miles, the distance from the head of water navigation to St. George and this city.

Considerable emigration was passing from Montana to the Arizona mines via Callville, where a bridge was being built across the Colorado.

THE PENALTY OF GENIUS.—A Prussian gentleman recently announced to the public that he had discovered a new cartridge and explosive bullet, by the use of which an army might be made invincible as against another not provided with the same contrivance. The paternal care of "Fatherland" was immediately interested in his behalf, and he now has a squad of twelve soldiers to guard and protect him day and night, lest he should communicate the important secret to some person, which may be or might become inimical to the Prussian Government. He is not allowed to write a letter without it being inspected by his guard or hold a word of conversation except in their presence. Verily, what polite attentions wait on genius under monarchical governments.

Reviews.

"PETROLEUM ETHER" is now used to extract the perfume of flowers.

The New York Central Railroad is about to import steel rails for two miles of track.

Over one million of gallons of wine will be made in Los Angeles county this season; and about 150,000 in Yuba county.

BETWEEN two and three hundred pounds of amalgam was stolen from Jus. French's mill at Silver City, Nevada, a few nights ago.

EIGHT THOUSAND CHINAMEN will be set at work by the Central Railroad Company, on the eastern side of the Sierra, on the first of December.

C. L. DABOLL, the inventor of the fog trumpet, noticed in a late number of the Press, died at New London, Connecticut, on October 13th.

DR. DE BRIVU, of Paris, has produced no enamel point made from india-rubber, which renders iron absolutely proof against the action of the atmosphere.

THE rates of fare in the steam line to China will be from Hong Kong and San Francisco, \$300, \$200, and \$100 to the 1st, 2d and 3d cabins respectively.

KILANKA, the Sandwich Island volcano, was the scene of another eruption on the 15th of October. It is said by those who were in the harbor of Hilo at the time, that it was a most magnificent sight.

A PROJECT for manufacturing the gas for New York at the Pennsylvania coal mines and bringing it to that city in pipes, is being discussed. The expense of laying two pipes 150 miles in length, and building the necessary reservoirs, will cost ten millions of dollars.

It is said that the portion of Illinois bounded by the Ohio river appears to be filled with lead veins thirty to fifty yards apart, and yielding ore in paying quantities. These veins begin about thirty feet below the surface, and have been traced down to the depth of 1,600 feet, becoming richer the deeper they descend.

CAUTION!

NOTICE.—TO WHOM IT MAY CONCERN.—THE PUBLIC are hereby notified that a patent was allowed Dec. 20th, 1864, and issued June 27th, 1865, to Professor Henry Wurtz, for the use of Sodium and Amalgams thereof with quicksilver, in the extraction of precious metals from their ores. All persons using said Amalgams, or purchasing or selling Sodium or said Amalgams, for use in the treatment of gold or silver ores, are hereby cautioned that they will be prosecuted to the full extent of the law.

SODIUM OR MAGNETIC AMALGAM.

THE WURTZ AMALGAMATION COMPANY,
OF NEW YORK.

Assignees of letters patent granted to Prof. Henry Wurtz, the discoverer of the use of Sodium in the amalgamation of gold and silver ores, having established an agency in San Francisco, now offer to the mining community their amalgams, with full directions for their use, on the MOST LIBERAL TERMS. A large supply of the Amalgam, of any required strength, constantly on hand.

The terms and conditions upon which rights to use the process are obtainable, can be had on application to

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:
No. 1.—Or 9-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—price, \$850
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour—price, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass over the fixed Rock Crushers into the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or rod, which connects the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the machine, which, in combination with the fixed jaw, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 25th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

WATER WHEEL.—Adolphus Lind, San Francisco, Cal.: This invention relates to an improvement in the Jonval Water Wheel; by which it may be made to accommodate itself to dry seasons, with the least loss of power and trouble in adjustment. With this improvement there is no occasion to stop the wheel at all for adjustment; while it can be made to use more or less water in proportions of from one to five.

WASHING MACHINE.—Alexander Badlam, Sen., San Francisco, Cal.: This invention relates to certain combinations and arrangements of a water-hox underneath the wash-board; of metal dogs, worked by slots, set screws and nuts, by which the proper pressure is obtained upon the clothes by raising or lowering the movable rubbing board, also two dash-boards, to prevent the inconvenient splashing of the water—the whole constructed and arranged for joint operations substantially as described in his application.

QUARTZ MILL IMPROVEMENT.—Cummings P. Colby, Lancha Plana, Cal.: The nature of this invention relates to the placing of the cam shafts, used in stamp batteries, lower or nearer to the stamp heads, and attaching to them eccentrics, with collars from which extend upright rods, connected with a spring so arranged that the stamp, in falling, will give a quick percussive blow to the ore in the battery. By this arrangement of stamps and machinery, it is claimed that about three times the number of strokes can be given to the pestles, over those attainable in the ordinary batteries, where the tappets are placed upon the stamp stems, and worked by cams; the whole of which is operated without an increase of power, proportioned to that required to obtain the same work in the ordinary manner. A simple and convenient set screw arrangement is also introduced by which the stamps may be readily elevated and held at a uniform height for cleaning out the battery.

MACHINE FOR SAVING GOLD AND SULPHURETS. M. A. Woodside, Georgetown, Cal.: This invention consists of a revolving or endless blanket, of canvas or other material, upon which the ore is introduced, as it comes from the battery of a quartz mill, through a perforated feed-box; a pipe, perforated upon its under side, and extending across the blanket admits a shower jet of water sufficient to distribute the pulp over the same, and carry off the light sand down the upper side of the blanket, contrary to its motion, to the waste way; while the sulphurets and gold being heavier, are carried upward, as the blanket revolves, and are dropped therefrom into a box underneath. In order to secure their removal from the blanket, a revolving brush is made to revolve against the surface of the same, during its under revolution, by which any gold or sulphurets which may not fall off from the effects of gravity, may be brushed therefrom into the box aforesaid. This arrangement is intended to obviate the necessity of the tedious process of washing the blankets by hand. The inventor claims the endless blanket and revolving brush when arranged substantially as described and for the purposes set forth; also the perforated feed-box and water pipe, when arranged and employed for the purpose specified.

Each of the above patents were obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, in one half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California Inventions, and the promptness of our personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE.

DEWEY & CO.,
Patent Agents, 505 Clay street, San Francisco.

SIXTY-SIX tons of copper ore from the Planet mine, Arizona, which arrived here by the William Ireland, sold at \$106 per ton.

HEPBURN & PETERSON,

At the VULCAN IRON WORKS, Nos 137 and 139 First Street, San Francisco.

THE PENINSULA OF SINAI has recently been carefully examined around its coast, and throughout most of its interior, by Rev. F. W. Holland, who has prepared a very interesting report of his examinations, describing various roads, ruins, etc., discovered by him in unfrequented localities, bespeaking a period of large population and civilization at some former period. Sinaitic inscriptions and ancient turquoise mines were discovered. All these remains are most likely due to the former occupation of the peninsula by the Israelites, during their passage from Egypt to the Promised Land.

Endorsement by the Miners' State Convention

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great mining interest, of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Mining and Scientific Press.

Terms: One Year, \$5; Six Months, \$2.

Single Copies, Fifteen Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS,
And Patent Solicitors.

[Reported for the Mining and Scientific Press.]

California Academy of Natural Sciences.

REGULAR MEETING, Monday, Dec. 3d, 1866.
President in the chair.

Twenty-one incumbents present.

Donations to the Library.—American Journal of Arts and Sciences; Proceedings of Philadelphia Acad. Nat'l. Sciences for April, May, June, July and August, 1866. Annals of Lyceum Nat'l. History of New York. Transactions of Connecticut Academy of Art and Sciences, Vol. I, Part I. Silliman's Journal, Vol. XLII. Proceedings of the Essex Institute, January, February, March, 1866. Observations on the Cranial forms of the American Aborigines, by Dr. Meigs. Memoirs before the Boston Society of Natural History, Vol. I, Part I, 1866. Annual Report, 1865, of Museum of Comparative Zoology of Cambridge, Mass.

Synopsis of North American Gauriææ, by J. T. Rothrock, B. S., July 1864.

Monatsbericht der Königlich Preussischen Akademie der Wissenschaften zu Berlin, February, March, April and May, 1866.

Fossils in the coal formations by Leo Lesquereux, May, 1866.

Congressional Documents and Stato Papers presented by Hon. John Conness.

Verhandlungen des natur historischen Vereines, etc., Prof. C. O. Weber, M.S. 1864.

Zoologisch-botanischen, Geso Uschoft, 1864.

Dr. F. Hanson was proposed for resident member.

Mr. Stearns exhibited specimens of *Petricola California*, and *Pholididea ovoides* in unusually hard serpentine, collected by him at Fort Point, San Francisco.

Prof. Whitney read a letter from M. Auguste Bernard, giving an interesting account of the discourse of M. Bernard, in connection with the age of the coal formations, and of the silver bearing strata of Chile, tracing the same through the Province of Lower Mexico, to the State of Nevada, and affording hope for the discovery of a true coal in that State. The labors of M. Bernard in Sonora and South America are of much importance, and will, undoubtedly, result in throwing light upon the age and peculiarities of said formation, of great scientific value.

Messrs. Whitney, Stearns and Knight were appointed a Committee to examine and procure a room, or rooms, for the Academy.

Messrs. Behr, Ashburner and Ewer were elected a Committee to nominate a ticket for officers of the Academy for the coming year. Adjourned.

PATCHED BULLETS are now made for breech loading rifles. For close shooting a patch is indispensable. Hence muzzle-loaders have been considered to have in this respect an advantage over breech-loaders; patches not being used in the latter. In this invention, the patch is nicely fitted and fastened firmly upon the bullet by means of a matrix and die.

The cylinder of the hydraulic press which was used to push the Great Eastern to the water, weighed twenty-two tons.

HENDY'S NEW CONCENTRATOR.

We give annexed an illustration of Mr. Hendy's latest improvement to his concentrator. As we remarked in our issue of the 17th ult., the old Prater machine, under Mr. Hendy's manipulation, has been so transformed as to present but little of the appearance of the original machine. By this improvement the conical feeding distributor has been entirely done away with. The feed in this machine is made to enter the conical box, C, which is sustained by the curvilinear support which is seen to spring from the right hand side of the pan; from thence it passes through the hollow arm leading to the T attachment, marked D, which

HENDY'S NEW IMPROVED CONCENTRATOR.

is made to sweep slowly around the circumference of the pan, by means of the ratchet teeth upon the upper edge of the same, into which two pawls are seen to work. This motion is obtained from the vibrating action of the pan, as in common use. Upon the under side of the T attachment to the arm, are small openings through which the pulp is dropped from the feeder into the pan. The constant revolution of this arm secures a more uniform feed than can be obtained from the conical feeder. A set of stirrers, with small projectors or teeth is shown, which is also kept in revolution with the feeding arm, the design of which is to prevent the sand from packing near the center, where the motion is diminishing. The discharge orifice and box for receiving the sulphurets will be readily distinguished. Those pans may be so connected, as in the ent, that two can be driven by one shaft and pulleys. We understand that two of those machines have already been ordered by Mr. Hooper, the proprietor of the Gold Hill mill, Grass Valley, where they may soon be seen at work. We are also authorized to state, that these pans will be sold on thirty days trial—with no sale unless satisfaction is given. They are manufactured at the Union Foundry in this city, where one of the pans can be seen in operation.

A PNEUMATIC tube, like the one at work in London, is being laid down in Paris, for the conveyance of letters and packages between the Grand Hotel and the Bourse.

THE PARIS EXPOSITION.

At the meeting of the Paris Exposition Committee, held in this city on Tuesday last, Dr. Pigne-Dupuytren stated that he had received a letter from the French Minister of Commerce, which conveyed ample assurance that the articles sent from California should be allowed sufficient space for exhibition, if sent from here even as late as by the steamer of January 18th, 1867, and also one from the Director of the *Ecole des Mines*, at Paris, conveying the same assurance. The dispatch from New York, requiring all articles going via New York to be forwarded from here by December 10th, refers only to articles sent in

on Thursday afternoon, at which several of the new members were present, who manifested much interest in the general business of the Committee. After considerable discussion with regard to the propriety of raising funds, and the proper objects for which such funds should be disbursed, on motion of Mr. J. W. Stow, the following resolution was unanimously adopted.

Resolved, That a Finance Committee be appointed by the Chairman, whose duty it shall be to distinctly define the object for which the Commissioner was appointed by the State; to estimate the amount required for the object contemplated in such appointment, and for the transportation of any contributions to the World's Fair, and to make a public statement and appeal for funds sufficient to meet such contemplated expenditure.

The Chairman appointed Messrs. Stow, Woil, Deeth and Hong, of Sacramento, as such committee.

The meeting then adjourned.

THE PROVIDENCE LEDGE.—Mr. T. F. Dingley has exhibited to us some specimens of ore from this claim, of which he is superintendent. He has also shown us the memoranda of assay and working test of the same. The former shows \$119.26 in gold, and \$32.77 in silver, amounting to \$152.03 the ton. By mill process the figures are \$48.20. Mr. D. favored us with some notes in reference to the mine, from which we extract the following:—

It is located at a point about two and a half miles from Grass Valley, and one and a half from Nevada City. There are 2,100 feet in the claim. Two tunnels have been run in; one, the lower, to the distance of 400 feet, the upper one, 700 feet. In the head of the latter, there is a chimney of ore 15 feet in width. A chimney from 3 to 12 feet wide runs up through both tunnels. In this, ore is now being taken out from near the surface of the ground. From this chimney \$32,000 has been taken within the last two or three years. The company have a 12-stamp steam mill. This is believed to be a mine which would prove a most valuable one if properly worked. Hoisting works are at once required, and certain improvements in the machinery now running.

CITY COLLEGE EXHIBITION.—The semi-annual exhibition of the City College was held on Tuesday evening last, at Calvary Church. Rev. Mr. Veeder, the Principal of the Institution, presided at the exercises, which consisted of essays and declamations, interspersed with music. The performances were of a very superior character, and evinced the most critical as well as practical training. The young friends of the scholars, of both sexes, were out in full force, filling pretty much all the seats in the gallery, from which regular showers of bouquets were rained down upon the speakers, as they successively brought their individual exertions to a close; the general applause from the body of the house was equally as emphatic as the floral demonstrations from the galleries. The City College is regarded as one of the most thorough and promising institutions of learning in California. It has a most efficient corps of teachers, with extensive philosophical apparatus, and a chemical, assaying and mining department, equal to almost any institution, even in the older States. We are pleased to learn that the number of pupils is steadily on the increase.

Another meeting of the Committee was held

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

The Distillation of Gold and Silver Amalgam by Superheated Steam.

BY G. LANSZWEERT.

The very trite, but somewhat uncomplimentary proverb, having reference to certain persons and their money, and the well-known fable of the dog and the shadow, will, it would appear, never want for illustrations, even in California. In rescuing from oblivion the following described process, for the public benefit alone, I may possibly put a light damper on a new, so-called patent *modus operandi*. The new "processes," which are being so constantly protruded upon the public, seem to be, to use the words of Kingsley, "necessary evils, like rats, and which, like them, must be kept down judiciously." The process of distilling amalgam by superheated steam, was first published in the *Comptes Rendus*, of the Institute of France, October 14th, A. D. 1850, and presented to that body by M. Violette. It consists in immersing the amalgam to be distilled in a current of superheated steam, from 350 to 400 degrees Centigrade. The steam acts at once as the heating and mechanical agent; it first heats the metal so as to produce distillation, then drives before it and draws the mercurial vapor, the production of which it facilitates; it hastens the distillation, just as a hot current of air increases the evaporation of water. The aqueous vapors, charged with mercurial vapor, are condensed together in a common refrigerator; the metal settles at the bottom of the receiver, while the condensed water occupies the upper part. It is curious to observe the liquid thread, which flows from the refrigerator; two currents or threads are distinguishable—an upper one which is water, and the lower one mercurial—there is thus a continuous current of both. No concussions occur; the operation goes on as quietly and as easily as the distillation of water.

The apparatus which was employed in these experiments, consisted of, 1st, a cast iron cylindrical retort, receiving the vessel which contains the mercury; 2d, an iron worm (a superheater), through which the vapor of water circulates, heated to the proper degree, and, entering the retort, traverses it from one end to the other. The mercury being immersed in it, escapes with the mercurial vapor, and both are condensed in a refrigerator.

The author gives, in a series of tables, the results which he has obtained by many experiments, in the distillation of mercury alone, and amalgamated. He states the quantity of vapor necessary, and the economical advantages of this new process.

1. *Facility of the operation.*—Simple ebullition and distillation of water are substituted for the difficult and dangerous distillation of mercury, while there is more trouble in managing the fire, more danger of breakage of the retort, more difficulty in removing the metal, and more wear of the retort. Whereas, in the new process the temperature is constant and fixed, and much lower than the red heat usually employed.

2. *Economy of operation.*—One workman alone can manage an apparatus, charged with 2,000 pounds of amalgam; as this new process is adapted even to larger dimensions.

3. *Economy of fuel* is certain, but practice alone can state the amount of it; no useless expenditure of fuel will occur, since the heat employed will not be greater than required for the distillation of the metal.

4. *Economy of Mercury.*—The distillation of 200 pounds of silver amalgam occasions the loss of four pounds of mercury. There are produced and distilled, annually more than six millions of amalgamated silver; there is therefore a loss of 240,000 pounds of mercury worth about \$200,000—which loss the new process avoids.

5. *Health.*—In the new process there is no loss of mercury; the mercurial vapor is condensed with the vapor of water; further, in the ordinary operation, mercurial vapors fill the whole of the retort, and when opened at the close of the operation, the vapor is diffused in the atmosphere; whereas in the new process the steam has driven all metallic vapors from the retort, and no danger exists in opening the same. Thus the operation is complete. The use of superheated steam seems to have effected the long sought solution of the problem of perfectly preserving, not only the workmen from the baneful attack of mercury, but also effects a great saving of the previous unavoidable loss of this agent, so largely used on this coast.

[Written for the Mining and Scientific Press.]

Sierra County Mines.

[Continued from Page 290.]

In a westerly direction from the belt of magnesian rocks in which the Sierra Buttes mine occurs, we find adjoining and lying parallel to it a powerful belt of a whitish compact limestone; on leaving which we strike the ordinary silicious and clay slates, metamorphosed and often freely laminated. These slates are traversed by numerous veins of quartz, which give little or no indication of being auriferous. This formation is continuous, crossing its line of strike for about five miles, when a belt of limestone (hydrocalcite) is seen adjoining a granular quartzose mass. On the west, between the latter formation and the slates, auriferous veins of quartz occur; their strike the same as the surrounding rocks—N. 10° W.—magnetic. Galena appears to be the predominating ore, associated with iron, arsenic, and auriferous copper pyrites. Workings and developments on the

KANAKA MINE.

Located on a powerful and heavily mineralized vein, varying from four to sixty feet in width, in depth 160 feet vertical, have demonstrated that in depth, arsenical manganese, to a certain extent, replaces the auriferous ores, reducing the average yield. For about 100 feet in depth the ores averaged, by simple amalgamation, in free gold, from fifteen to twenty dollars per ton. This zone or plane appears to extend horizontally into the hill or mountain, which rises rapidly, affording constantly increasing backs. Below this level, the ore, as I previously stated, rapidly depreciated. It is quite probable, however, that when the main adit level shall have been driven into the hill, a better class of ores will be struck, the vein being powerful and heavily mineralized; in fact, the face of the adit shows a decided improvement. The company have a fine new mill of twenty stamps, propelled by water-power. That this vein is continuous for from five to six miles, has been demonstrated by several recent discoveries on its line of strike—good prospects having been obtained, and locations made, but no developments as yet. Thence westerly, through a country slightly metalliferous for five miles, we reach an important mineral belt in the vicinity of Downieville, consisting principally of talcose slate, in places indurated and changed, so that its slaty structure is completely lost; showing evidence of powerful heat, which has, undoubtedly, occasioned the metamorphic changes observed. A mass of volcanic brecciated and cemented material appears to have flowed from a fissure in close proximity to the town of Downieville—an independent volcanic vent. This mineral belt is about two miles in width, and is reticulated by veins and threads of gold-bearing quartz, with a general northerly and southerly trend. The line of demarcation between the metalliferous and non-metalliferous regions is plainly drawn and easily traced—not only by the change in the color of the soils, but a marked change in the vegetation. In the metalliferous belt, the formation, its veins of quartz, and subsoils, are discolored and stained by the oxydation of its metalliferous contents; on the surface the soils invariably show the presence of gold by the horn test, particularly when near a metalliferous vein. The slates are often found rich in pockets; the veins, as a rule, belong to that class of auriferous deposits known as segregated and contact deposits, with few exceptions. An important and powerful deposit of the former class passes diagonally through the upper portion of the town of Downieville, and has, undoubtedly, contributed in a great measure to the unparalleled richness of its placers, which formerly yielded munificently, showing their greatest richness a short distance below the vein. This deposit or vein is traceable for nearly four miles in a northerly and southerly direction. Its ores are auriferous iron pyrites, of a very rich class, some of them, when concentrated, yielding by assay as high as eighteen hundred dollars per ton, and rarely going under two hundred. By an imperfect and crude system of amalgamation, they have paid

from eight to thirty-two dollars per ton of free gold. The advantages for heavy backs and unlimited water-power, are unsurpassable. Of the principal developed properties, we find the Gold Bluff the most northerly; thence, southerly, the Montpelier, the Oro, and the Slug Cañon. Of unimproved and undeveloped locations, there are quite a number which give promise of being made reliable properties, with a reasonable expenditure of capital.

Near the easterly line of contact with the non-metalliferous silicious slates, discoveries have been recently made of a continuous vein, or series of parallel veins, containing a very rich auriferous arseniuret of iron (mispickel), traceable for some three miles in a northerly and southerly direction. The formation is a highly mineralized indurated talc, in places quartzose, bearing a strong resemblance to that of the Crescent mine of Indian Valley. The metalliferous veins, proper, vary from eight inches to six feet in width. Locations have been made to some considerable extent. The ores by assay show large returns. This discovery bids fair to prove of considerable importance. The main difficulty the mine will have to contend with will be the intractable and rebellious nature of the ore; arsenic and its compounds being the amalgamator's worst enemy—"sickening," or "flouring" and coating the quicksilver to such an extent as to render it almost useless for amalgamating purposes. The ores will have to be roasted and chemically treated in order to extract the gold. Other veins of a similar character and great richness have been recently discovered.

THE MAMMOTH

Lies west of the segregated vein previously described, and near the westerly boundary of the talcose belt, at its junction with an extensive belt of serpentine, which is traceable through the entire State. This vein is found much broken and crushed, but lying in place with an easterly dip at a considerable angle of inclination. Its power is from three to six feet. The main deposits of mispickel ores lie on or near the foot-wall. Near the croppings the ores are found much decomposed, and the gold is free. With no other machine but a miner's washpan, from two hundred to three hundred dollars per day has been extracted from the superficial decomposed ores. The proprietors are now sacking them for shipment to San Francisco for reduction. This vein has been opened in several places at considerable distances apart, and good prospects obtained, proving it to be extensive.

THE GOOD HOPE COMPANY

Have been quarrying ores and crushing at a custom mill for some three or four months, the ores yielding from twenty to thirty dollars per ton. Vein well defined; gold free and very fine (flour gold), associated with iron pyrites in small cubes.

There are many other locations of note in this vicinity that are being vigorously developed with encouraging results—the Sailor, Mexican, Junction, etc., etc. In fact, the recent rich discoveries have given new life and an impetus to this branch of business; and it is safe to predict that this group of metalliferous veins will be rapidly developed, and at no distant day prove an important acquisition to the mineral resources of our State.

While in Downieville, I had the pleasure of seeing a cabinet collection of minerals, principally of Sierra county ores, at the Mining Agency and Assay office of Crossman & Cochran, of which I saw a descriptive catalogue in a late number of the Press. This is a move in the right direction, and the example should be followed in every mining locality in the State.

VIAJADOR.

To DETECT COPPER IN PICKLES.—Cut up some of the pickle in thin slices and put them into a vial, with sufficient liquid ammonia, diluted with half its quantity of water, to cover them. Shake thoroughly. If the most minute quantity of copper is present, the liquid will assume a blue tint, of greater or less intensity, according to the quantity of copper present.

ONE hundred and sixty-one miners, says the Nevada Gazette of December 3d, have been assessed in this county, since the first of May last, as liable to pay the mining license of ten dollars. The law under which the license is levied reads as follows: "Every person, firm or company, who shall employ others in the business of mining for coal, gold, silver, copper, lead, iron, zinc, or other minerals, not having paid the tax therefor as a manufacturer, and no other, shall be regarded as a miner; provided, that this shall not apply to any miner whose gross receipts as such shall not exceed annually one thousand dollars."

PROCESS OF ROASTING ORES, ETC.

Translated from the German of F. Plattner, for the Mining and Gas-Light Journal, New York.

BY J. H. TIEMANN, M. E.

NUMBER FOUR.

When, on the contrary, the heat comes from the hearth of the furnace, it often happens that the ore sinters (cakes), in which condition it adheres as firmly to the hearth as if it had been smelted. Although this may be overcome to a certain extent by constant stirring with the roasting rake and scraper, there is still another disadvantage, viz.: that the heated under portions of the ore upon coming to the surface are too much cooled by the cold air, in consequence of which the oxydation of the sulphur metals and the roasting is very irregular, and a quantity of large and small lumps are formed, which latter often contain large quantities of undecomposed ore. It is thus shown, that for such ores or products as are inclined to sinter (cake) in roasting, an ordinary reverberatory furnace is better adapted than a muffle furnace, and that a constant stirring of the ore with the roasting rake, especially in the first part of the process when the oxydation is the liveliest, is absolutely necessary.

On the other hand, when the ores or products to be roasted consist of such sulphur or arsenic metals which do not easily incline to sinter, a muffle furnace may be used as well as a reverberatory, when in the former the requisite amount of heat can be produced. Neither is it necessary (except in certain cases which will be noticed hereafter) that the substance to be roasted should be so constantly stirred as those which sinter easily; in fact, it would be wrong to do so with sulphur metals which roast at a high temperature, as for instance zinc-blend, because the oxydation having been commenced might be thus easily retarded, especially where the substance is roasted in a muffle furnace. A particular method for each different case is not possible, for here, as in most other processes, practice is the best teacher.

II. Practical examples of the formation of sulphates, arsenates, antimonates and free oxyds, in the roasting of sulphur metals or sulpharsenic and arsenic metals.

A few examples taken from practical tests will serve to show distinctly that ores or mill products, consisting of sulphur metals or sulpharsenic with arsenic metals, when roasted either in large quantities in a reverberatory furnace with a horizontal hearth, built in accordance with the foregoing principles, or in smaller quantities on a clay dish in a muffle, with a proper addition of atmospheric air, and at the lowest possible temperature, always show an inclination, according to their chemical composition, to change the sulphurets, arsenates or antimonates, and the resulting sulphates, upon an increase of temperature, are more or less decomposed, and in the same ratio change to free oxyds.

A. Examples of the deportment of different ores and mill products, when roasted in a pulverized form in a reverberatory furnace, or in small quantities in a muffle.

1. Schwefelkies (iron pyrites), when pulverized and exposed to a temperature sufficient to ignite sulphur, and the requisite amount of air is admitted, soon begin to glow, and in some places burn with a flame; the glow soon spreads throughout the entire mass, and in consequence of the oxydation of the sulphur and iron, sufficient heat is generated at those points where the air with all its oxygen comes in contact with the ore to drive off nearly the half of the sulphur from those parts with which it does not come in direct contact.

If the glowing mass of ore be stirred, so that gradually all the different parts come in contact with the air, an increase of temperature is apparent, and in consequence of the generation of gas and steam, and a general change in the whole mass, an increase of the volume—it becomes "wooly"—so that, if the roasting has been carried on in a reverberatory furnace, it flies in every direction from the rake or whatever instrument may be used for stirring, no matter how slowly or carefully the instrument is moved. The sulphur of those parts of the pyrites with which the air comes in direct contact, burns quickly to sulphurous acid which passes off as a gas, while the sulphur which is driven off by the heat generated by the oxydation, either burns in like manner to sulphurous acid when the heat is sufficient and there is no lack of atmospheric air; or when the heat is not sufficient, it escapes partly in the form of vapor. In the same ratio as the oxydation of the iron and sulphur approaches completion, the temperature and the wooly appearance of the ore decrease, so that finally the red glow disappears, and the roasted ore, if not heated by fuel, appears almost black.

but when entirely cool assumes a light red color. The product of such a roasting consists of free oxyd of iron, and a small amount of basic sulphate, very often but 0.4 to 0.5 per cent. of sulphuric acid is found in it, which, if we think of it in combination with the oxyd, would give 1.3 to 1.6 per cent. of simple sulphate of iron. If the mass be again heated to a glow with fuel, it swells again, becomes woolly, and as the oxyd of iron is a weak base for sulphuric acid, it changes almost entirely to free oxyd, the sulphurous acid going off as a vapor. If the heating be effected by means of a flammable fuel, which carries out or ignites reducing gases to the glowing oxyd, a part of the latter is changed to a combination of sesquioxyd with protoxyd, which, after cooling, is almost black and is attracted by the magnet. The quantity of this compound is the greater, the less the amount of air admitted to the roasting chamber between the flame and the already formed oxyd.

2. Magnetites (magnetic pyrites) Fe S , Fe S_2 or Fe S , Fe S_2 , when exposed in a powder, and by admission of atmospheric air, to a dark-red heat, glows gradually, evolves sulphurous acid, and changes, especially when constantly stirred, to a spongy sesquioxyd of iron, which, on cooling, has a red color, but contains a little sulphate and persulphate. If this red product is heated further to a bright red heat, the protoxyd is oxydized, at the expense of the sulphuric acid, to sesquioxyd, and free sesquioxyd and sulphate is formed, while sulphurous acid passes off; the sulphate forms now but a small percentage of the mass, and if the roasting be continued, decomposes almost entirely to free sesquioxyd and sulphuric acid. If the under layer of the gaseous products of combustion was free from unignited and consequently reducing particles, the product on cooling resumes its red color, otherwise it retains more or less of its dark color, and as it contains sesquioxyd, is attracted by the magnet.

Note.—Should any one desire to convince himself of the amount of heat generated by the oxydation of an easily oxydizable metal, it is only necessary to take metallic antimony or arsenic. If a piece of the former of the size of a pen be heated on charcoal before the blow pipe till it smelts, and the heat continued till the fluid metal is red hot and gives off fumes, and the heating be then discontinued, the metal continues for a long time in a fluid state, evolving thick white fumes, which at first settle on the coal, finally on the metallic globule, in mother of pearl colored needles, which are thus explained: The fluid metal absorbs oxygen from the air, forming an oxyd of antimony, generating thereby sufficient heat to retain the easily fusible metal in a state of fusion, which continues till the globule has been completely surrounded by the oxyd. Metallic arsenic, when heated in the same way, changes to arsenious acid.

The Meussdorffers.

We copy the following from the *Mountain Messenger*, published at Downieville. We have known the parties mentioned long and favorably, and can say the compliment paid them is a just one:

The unwritten history of many an early pioneer in California, if properly embellished by one of our popular authors, would make a volume of surpassing interest. The subjects of our sketch are the well known batters of that name, whose trade dates back successive generations from father to son, two hundred years, to the old home in Germany, where the ancestral father still resides, and in whose possession are still retained the rule tools made use of by the different families from the eldest Meussdorffer down to the present century. About the year 1841, the elder brother, J. C. Meussdorffer, left home to try his fortune and learn what he might in the extensive and fashionable establishments of Paris. Having remained in the largest establishments and acquired the skill of the French artists, in 1845 he came to New York, traveled and worked at his trade through the principal cities of the East, till the year 1849, upon the discovery of gold in California, he joined the Overland emigration, enduring the hardships incident to those perilous times from raids by Indians, exposure and starvation. He arrived at Sacramento in the fall of that year, and after several fortunes rapidly as easily made and lost at mining, he again resumed business as a hatter. Times were flush, and by catering to the peculiar tastes of the early miners in fashioning their "fles," he made money rapidly, and had gained an extensive business, when the cholera of the fall of '49 commenced its ravages, decimating the population, closing the doors of the community, and draping them in mourning. So malignant and rapid was its course, that many retiring in health at night were ready for the shroud and the hearse ere the daybreak of another morning.

With others the subject of our sketch broke up his establishment and fled, locating himself at San Francisco. Fortune smiled again, and in '53, having succeeded to a large business and comparative independence, he sent for his brother Konrad, and in '58 for Henry, while Martin, the youngest brother, arrived in 1860. Business in the meantime increased rapidly, and branch establishments were opened at Marysville, Sacramento, New York, Paris and Portland, all of which are still doing a prosperous business. It is hardly necessary to mention that these men excel at their trade, that they are close calculators and honorable business men. That through liberal and judicious advertising they became known throughout every county and town in the State; while as skilled artists they have modeled the fashions, led the trade, and extended their influence beyond the limited confines of the Pacific. Three of the five hats lately on exhibition at Sacramento, designed for the Paris Exhibition of 1867, were of their manufacture, and go there to challenge all nations for the prize. Having been acquainted respectively with these brothers, mostly during their residence at Marysville, and had dealings with them for several years, their name and the reputation of their work have become familiar to all our readers.

Scientific Miscellany.

SINGULAR PHENOMENA.—If polished discs of dissimilar metal—say zinc and copper—be brought into close proximity, and kept there for some time, and either of them has irregularities upon its surface, a superficial outline of these irregularities is traceable upon the other disc, and vice versa. Many theories have been suggested to account for this phenomenon; but whether it be due or not to thermic radiations, the relative temperature of the discs, their relative capacities, and conducting and radiatory powers for heat, are thought, beyond a doubt, to influence the phenomenon.

Again, if two such discs, in close proximity, be connected with a delicate electroscope, and then suddenly separated, the electroscope is perceptibly effected; showing that the reciprocal radiation from surface to surface has produced electrical force.

The term "thermographic" has been applied to this class of phenomena, and although these singular effects are generally attributable to radiant heat, the real origin thereof is still considered a question open to doubt, and an interesting matter for careful philosophic experiment.

TRANSCALESCENCE is a term applied to bodies expressive of their powers of transmitting heat, and their transparency. This power is possessed by various bodies in different degrees; for instance, perfectly transparent alum arrests more heat than quartz rock, so dark colored as creta to be opaque. Rock-salt has thus far proved to be the most transelescent to heat of any known substance. It may be covered with soot until it is perfectly opaque, and it will still be found capable of transmitting a very considerable quantity of heat. Philosophers have devised a very ingenious instrument for accurately measuring the different amounts of heat which bodies will thus transmit. The instrument is called a *thermo-multiplier*, from the fact of its action being due to its ingenious arrangements for multiplying the forces of thermo-electricity.

TO TEST THE PURITY OF CHLORIDE OF GOLD. The chloride of gold and sodium in its pure state is easily soluble in alcohol, while free chloride of sodium is not. If, therefore, the gold salt contains some free chloride of sodium, the latter will remain undissolved upon treating it with alcohol. Much of the chloride of gold and sodium sold to the photographic artists is adulterated by adding an excess of sodium, which is of very small cost; while the photographer pays for it at more than the price of gold. The above method of detecting such adulteration, which is simple and within the reach of every one, will be useful information for photographers.

OLD COLLODION.—Humphrey's *Journal* says that old collodion may be rejuvenated and made useful in the following manner: Add alcohol and ether in equal parts—or a mixture of one-third alcohol and two-thirds ether is still better—until the collodion flows easily and is thin enough to coat the plate without streaks; furthermore, to each quart of collodion add sixty grains of bromide of cadmium, and put the mixture, after frequent shaking, in a cool, dark place. This collodion probably will become colorless, and work as well perhaps as the best new collodion that can be made.

COLORS GLASS, when heated so as to be luminous, emits the same light which, at ordinary temperatures, it absorbs; thus, red glass gives out or radiates, when heated, a greenish light, and green glass a red light. This phenomenon is due to the long known principle, that the radiating power of different substances is directly proportionate to their absorptive, and inverse to their reflective power.

It is said that common salt, which, when mixed with animal substances in large proportions, arrests decomposition, when used in small quantities considerably accelerates putrefaction.

CAUTION.—Tomatoes placed upon a newly-painted shelf to ripen will take up the lead in such a force as to make it poisonous. This should be remembered.

THE REDUCTION OF SILVER OXYD BY CADMIUM.—Silver oxyd is easily reduced to the metallic state by means of cadmium. A solution of nitrate of silver is evaporated with sulphuric acid until all the nitric acid is driven off. The sulphate of silver is then dissolved in hot water, and a stick of cadmium is placed in the solution. The reduction of the silver oxyd proceeds immediately, the metallic silver is easily separated from the cadmium, and collected in a mass which can be washed by decantation with hot water without loss. A porcelain crucible, the weight of which has been previously ascertained, will serve to effect the reduction in. As the reduced silver may possibly have a little cadmium mixed with it, it is well to heat the acid liquor until no evolution of hydrogen takes place. In the clear liquid which remains not a trace of silver can be recognized. The reduced silver is now washed until the washings give no precipitate with chloride of barium, then dried, and lastly ignited, by which the greyish black of the precipitate is changed to silver white.

The reduction of silver compounds by means of cadmium goes on very quickly, and as cadmium is but slightly soluble in dilute acids, the same piece of metal will serve for several operations, without even losing the metallic luster of the surface.

Freshly-precipitated chloride of silver may be treated in the same way.

The *London Review* observes that M. Melseus has recently presented a note to the French Academy showing that two salts having no chemical reaction on each other, and each of which may be administered to an animal in succession without danger, may, if given simultaneously, be productive of death. M. Melseus gave dogs daily large doses of iodide of potassium without injury. He did the same with chlorate of potash. Iodate of potash is rapidly fatal to dogs. Although iodide of potassium and chlorate of potash have no chemical action on each other under ordinary circumstances, if given simultaneously to a dog they quickly destroy life. These experiments evidently have an important bearing on the art of prescribing remedies, for they show that medicaments, perfectly inoffensive in themselves, may, by being compounded together, and thus brought in contact in the laboratory of the animal frame, give origin to a poison rapidly fatal to life.

MONSIEUR CHENOT'S "IRON SPONGE" is used to effect the desulphuration and dephosphuration of ores. It is made by reducing dry ores of iron with carbonic oxyd. The pulverized ore is mixed with the "sponge," and then treated in a reverberatory furnace with a covering of charcoal powder. A previous roasting is not necessary. The cost of this method is said to be much less than that of any other.

The retina decomposes the rays of light in a different manner from that in which the prism decomposes them. The latter disperses the rays with reference to different points of space; the former with reference to different points of time. So says M. Laborde in a late communication to the Academy of Sciences.

The production of pure iron is impossible when phosphorus is present. Carl Wintzer, a Hanoverian, has found that chlorine gas and chloride of calcium will effect its removal. By their means volatile combinations of phosphorus are formed, which are easily expelled.

TO DETECT PAPER MADE FROM WOOD.—Wood shavings are now extensively used for the manufacture of paper. To ascertain whether a given kind of paper contains wood, it is dipped in a warm solution of aniline and dilute sulphuric acid, when it will be immediately colored orange if wood be present. The more intense the color the greater the proportion of wood.

If an iron wire be twisted during or even after the passage of a voltaic current through it, the wire becomes magnetic. When the wire is twisted in the manner of a right-handed screw, the point at which the current enters becomes a south pole; in the opposite case it becomes a north pole. If, during the passage of the current, the wire be twisted in different directions, the polarity changes with the direction of the twist.

A NEW METHOD for manufacturing gas by introducing petroleum with lime water into the retorts when charged with coal, has been patented. It is claimed that the cost of the gas is 30 or 40 per cent. less than when made with coal only.

ARTIFICIAL LIGHT FOR VEGETATION.—Plants grown under the light of the electric lamp show that their green color is equally capable of being produced under the influence of such light as under that of the sun.

Mechanical.

EXPANSION OF GRATE BARS.—At a late meeting of the Austrian Society of Engineers, grate bars were produced which had suffered an expansion of 0.08 of a metre in every metre. This expansion had taken place not only longitudinally, but in all directions, and was ascribed to the transgressions of the limits of elasticity by a long application of a high temperature. Experiments are now being conducted for the purpose of ascertaining the laws in reference to this permanent "set."

SILICATES.—A NEW AND VALUABLE MORTAR. M. Artus proposes a method of preparation by which the process of silication is much favored; by which, it is said, a mortar may be prepared which becomes as hard as cement, does not crack in setting, and may even be used as a hydraulic cement under water. His process is the following: Take good slaked lime, and mix it with the utmost care with sand finely sifted. Mix the sand thus prepared with finely powdered quicklime, and stir the mixture thoroughly. During the process the mass heats, and may then be employed as mortar. Of course the mixture must be used just as it is to be used.

"One part of good slaked lime was mixed with three parts of sand, and to this was added three-fourths of its weight of finely powdered quicklime. The mortar thus made was used in a foundation wall, and in four days had become so hard that a piece of sharp iron would not attack it. In two months it had become as hard as the stones of the wall."—*Franklin Institute*.

LOCOMOTIVE CONSTRUCTION.—A gradual increase is being made in the size and power of locomotives, and for high-speed engines the weight is now considerably in excess of that required for adhesion—high-speed engines being those in which the least weight consistent with efficiency is of the most importance. The steam pressure, too, is being gradually increased; but this, of course, is not attended with a saving of weight, except as the steam may be worked more expansively, and a greater amount of power thus obtained from a given quantity of steam.

Mr. John P. Laird has recently introduced an engine, with a patented improvement, the application of which has proved very successful on the Pennsylvania Central Railroad. We are not informed in what his improvement consists; but it has for its object increased adhesion and motive power, and saving of weight. The result is said to be that a small engine made after his plan will easily haul a train over the mountains that would require two of the large "camel back" locomotives in ordinary use.

CEMENTS.—The following recipes will be found to produce very hard and durable cements: 1. Four to five parts of powdered clay are mixed with two parts of clean metallic iron filings, one part of peroxyd of manganese, one-half part of salt, and one-half part of borax. All these ingredients must be well powdered and mixed and must be made into a paste with water. The cement must be used up quickly. Applied to the parts to be cemented, it is first dried at a slowly-rising temperature and finally exposed to white heat. The cement then is hard, resembling slag, and resists boiling water and red heat. 2. A similar durable cement may be prepared by mixing finely-sifted peroxyd of manganese and carbonate of zinc with soluble glass to this paste. It has to be used up rapidly.

A SINGULAR QUALITY IN STEEL.—A correspondent of the *Scientific American*, says that he was informed by a practical mechanic, that having made a spatula, or pallet knife, such as is used by artists, and tempered it to the blue, or spring temper, he ground and polished it, when it became as soft as before tempered. Considering it worthless, he laid it one side for a time, but one day he held it over the fire, it thoughtlessly, until it was blue, when he found it had regained its former elasticity.

The fact may be new to some of our readers, although we were practically acquainted for years with this quality of steel, at least of steel of some grades. We believe, however, that cast steel, generally, when brought to the blue temper, loses some of its elasticity if the blue is removed from the surface. Why, we do not profess to determine, but the experience of many workers in steel will confirm our own.

HOW TO PRODUCE A HARD CASTING.—Mr. Ganz, of Hungary, covers the inside of the molds, which in this case must be of iron, with a thin coat of paste made of a finely powdered metallic antimony and alcohol, and dried at 212° Fahr. An ordinary regulus of antimony will answer. The castings thus become covered with an extremely hard alloy of antimony and iron.

WEEKLY STOCK CIRCULAR

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
December 8, 1886.

MONEY MARKET.

The course of the money market since our last reference has been comparatively steady. The supply of capital seeking employment has increased, however, and the banks have now larger balances in hand than for some time past. As yet these influences have scarcely produced any tangible effect upon the discount market, and the regular rate in bank is $1\frac{1}{4}$ per cent. per month. Loans have been negotiated during the week upon merchandise and other very choice securities at 1 per cent. per month; but these are exceptional transactions. The continued buoyancy of the Mining Share Market calls for the use of considerable money among operators, and full rates are obtained by capitalists in their accommodations to this class of dealers.

Legal Tender Notes have been inactive during the week, selling at $71\frac{3}{4}$ @ 72 ; at the close yesterday $71\frac{1}{2}$ was bid. June 7-30's sold at $77\frac{1}{2}$ @ 78 . Latest telegraphic advices from New York quote gold at $139\frac{1}{2}$, and Sterling Exchange at $109\frac{1}{4}$.

Gold Bars rule at 840 @ 850 ; Silver is selling at 1 per cent. discount. Currency Bills on the East are offered at 32 per cent. premium on Gold, and Telegraphic Transfers are made at $2\frac{1}{2}$ per cent. premium. Sight Drafts, payable in coin, are selling at $2\frac{1}{4}$ per cent. premium. Sterling $48\frac{1}{2}$ @ 49 .

The Customs Receipts in this city, from January 1st to December 5th inclusive, amounted to \$6,891,037.33.

City Stocks are in better favor. San Francisco Gas Co. was largely dealt in at $63\frac{3}{4}$ @ $64\frac{1}{4}$; Spring Valley Water Co. sold at $60\frac{3}{4}$ @ 61 ; California Steam Navigation Co. at 66 @ $65\frac{1}{2}$ per cent., and Pacific Insurance Co. at \$179 per share.

The law relative to mineral lands, passed at the last session of Congress, proving to be very defective in many respects, has been thoroughly revised by the author, Senator Stewart of Nevada, assisted by a number of our more prominent officials connected with various mining companies, and in this form it will go forward by the steamer of the 10th instant, to be laid before Congress at its present session. We understand that very important changes have been made in many of its provisions.

MINING SHARE MARKET.

The Mining Share Market has attracted more attention this week than at any time during a like period within the past six months, and all first-class shares show a marked improvement since our last reference. The substantial character of recent developments in a number of claims, together with the dividends that are being regularly paid to stockholders, are tempting parties to enter the market who have kept aloof for a long time. The cash requirements for the heavy transactions during the past week have been very considerable, the business of the Board alone averaging nearly \$200,000 per day. As most of the purchases are for home account, these balances only change in name, neither augmenting nor decreasing the volume of money at present in the market. The late developments on the lower levels of the Comstock lode have established a high degree of confidence in the permanency of these mines, and the plan of a deep draining and working tunnel, heretofore proposed, is looked upon with much favor. The mining companies have been called upon to contribute a portion of the requisite funds, and a strong disposition prevails among stockholders, particularly those of the paying mines, to contribute liberally and promptly, so that this desirable work may at once be commenced. It is believed that with a portion of the capital thus obtained, and the tunnel fairly under way, the bulk of the requisite funds will be furnished by New York.

HALE & NORCROSS.—No sales during the week; \$2,000 @ $2,250$ is bid, and \$2,500 asked. The 65 per cent. assay value of 3,085½ tons of ore, produced during the month of November, gives the company \$175,134.62, equal to nearly \$57 per ton, and is the largest monthly yield of this company yet reported. The September returns amounted to \$152,363.74.

SAVAGE.—Sales during the week, 80 shares; opened at \$1,890, advanced to \$1,960, receded to \$1,900, then sold at \$2,000, and closed at

\$2,110. During the week ending December 1st, 1,250 tons of ore were extracted, assay value \$52,666, leaving an estimated profit of \$26,181 after deducting all expenses. The yield is not so large as the previous week, from the fact that the force of men employed were placed at work other than that of extracting ore. In the upper stations the quality is said to have improved, with no change in the quantity. Winze No. 3 is in fine ore at 40 feet below the 6th level. The north drift from the Cortis shaft is now nearly under Winze No. 3, and in good ore. It is the intention of the company to make a level connection with the 7th station works from the old shaft, about 150 feet distant, for which purpose work in the drift is vigorously prosecuted. Receipts of Bullion for November up to this time amount to \$225,000. A dividend of \$100 per foot was declared yesterday, payable to-day. This company have a surplus of about \$50,000, besides between 4,000 and 5,000 tons of ore in the mine, and all expenses paid for mining it.

CROWN POINT.—Sales during the week, 17 feet; opening at \$1,035 @ $1,075$, advancing to \$1,300 @ $1,250$, and closing at \$1,190. The yield of ore during the week ending December 1st has been larger than usual, amounting to 835 tons. The vein on the 400-foot level is said to be improving. The drift east from the 400-foot level is still in vein matter, and has attained a distance of 174 feet.

YELLOW JACKET.—Sales during the week, 256 shares. This stock sold at \$1,125 @ $1,170$ early in the week, advanced steadily to \$1,450, receded to \$1,175, then sold at \$1,350, and closed yesterday at \$1,330. We are unable to gain any information about this mine. No reports, either weekly or monthly, have been forwarded to the office in this city as promised.

GOULD AND CURRY.—Sales during the week, 22 feet; advancing from \$500 @ 515 to \$600 @ 610 , and closed at \$650. During the month of November about 5,350 tons of ore were extracted from the mine, of which 2,200 tons were delivered to the Gould & Curry mill, and 2,600 tons to custom mills. The bullion produced during the same period amounted to \$124,683.61; in October, \$114,321.67. The latest advices from the mine state that the water is being rapidly reduced, and that drifting had been resumed on the lower level. The annual meeting of stockholders takes place on the 17th inst.

OPHIR.—Sales during the week, 221 feet; opened at \$215, improved to \$290, receded to \$210, rallied to \$250, and closed at \$235. The shaft is now 90 feet below the 9th gallery. In the drifts north and east on the 9th level, small bodies of low grade ore have been found.

CHOLLAR-POTOSI.—Sales during the week, 649 feet; improved from \$221 to \$250, receded to \$250, and closed yesterday at \$232½. The north drift in the first station of the new shaft is in 296 feet, and has about 250 feet to run to reach the north line; nothing favorable so far. The recent development in the south drift, is said to be at present only two feet wide. During the week ending Dec. 1st, 726 tons of ore were sent to custom mills.

EMPIRE MILL AND CO.—Sales during the week, 198 shares; opening on Monday at \$150 @ 152 , gradually advancing to \$185, and at the close sold at \$220. This company pays a dividend of \$15 per share to-day, and we learn carry forward a surplus of nearly \$18,000. Within the past 90 days they have taken from their mine about 7,500 tons of ore—an average of over 80 tons per day, and have now at their dumps and at the mill over 3,000 tons. A winze has been sunk to the depth of twenty feet on the vein lately struck in their 700-foot level, with fine prospects of a valuable supply of ore. The working of this vein will be reserved for the new Empire-Imperial shaft, which is now down and timbered over 700 feet, and from which a drift to the ledge will probably be run sometime in February next.

IMPERIAL.—Sales during the week, 303 shares; fluctuated between \$127, h 30, and \$131, and closed yesterday at \$134. The stamped value of bullion received during the month of November is \$32,640.48. A "brick" valued at \$12,065 is included in the above amount, and is said to be the largest ever made in this State. The October returns aggregated \$98,380. A large amount of machinery for the Imperial-Empire shaft is now on the ground.

CONFIDENCE.—Sales during the week, 314 shares. This stock met with more than usual activity since our last reference, improving from \$70 to \$97.50, then selling at \$85 @ 90 , closing yesterday at \$90.

BELCHER.—Sales during the week, 195 feet; advancing from \$135 to \$190, then selling at \$135, and closing at \$140.

OVERMAN.—Sales during the week, 1,110 shares; ruling between \$20 @ 16 , and closing at \$14.... BULLION.—Sales, 82 shares; selling at \$15 @ 17.50 , and at the close brought \$16.... SIERRA NEVADA.—Sales, 1,430 shares; at \$2 @ 5 , closing at \$4½.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$970,214.75.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD

Monday, December 3.

1 shs Belcher at 147½ per foot b 10.
7 shs Belcher at 145 @ 150 per foot.
100 shs Ophir at 220 per foot.
20 shs Ophir at 245 per foot.
100 shs Ophir at 245 per foot.
44 shs Ophir at 210 per foot.
60 shs Ophir at 120 @ 240 per foot.
12 shs Ophir at 250 per foot b 30.
12 shs Ophir at 243 per foot s 10.
10 shs Spring Valley W W at 60½ per ct.
9 shs Spring Valley Water Co at 60½ p ct.
20 shs Chollar-Potosi at 230 @ 235 per foot.
3 shs Chollar-Potosi at 235 per foot.
2 shs Chollar-Potosi at 234 per foot.
5 shs Chollar-Potosi at 235 per foot, b 10.
10 shs Bullion at 17 per share.
5 shs Bullion at 17½ per share.
5 shs Imperial at 127 per share.
5 shs Imperial at 128 per share.
10 shs Yellow Jacket at 1225 per foot.

AFTERNOON SESSION.

100 shs Ophir at 270 per foot b 30.
44 shs Ophir at 275 per foot b 30.
200 shs Ophir at 260 per foot, c.

HALL'S SARSAPARILLA,
YELLOW DOCK AND IODIDE OF POTASS.

THE BEST BLOOD PURIFIER KNOWN.

Persons that are troubled with Rheumatism, Scrofula, Neuralgia, Morbid Liver, Salt Rheum, Pimples, Boils, or any of the many diseases that originate from Impure Blood, would find it much to their advantage to give this justly celebrated article a trial. One or two bottles are quite sufficient to convince the most skeptical of its merits. It contains neither Spirit, Arsenic nor Mercury, which cannot be truly said of any other preparation called "Sarsaparilla."

Pacific Mail Steamship Co's
THROUGH LINE TO NEW YORK,
Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11

o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 31 days.

On the 10th, 19th and 30th of each month that has 31 days.

Where the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo, Alloua, Acapulco, Vera Cruz, Yucatan, and St. Nazaire, and English steamer for Southampton, and P. R. R. Co's steamer for Central America.

Departure of the 30th connects with English steamer for the port of the new mines.

The following Steamships will be dispatched on dates as given below:

December 10th—MONTANA, Capt. —

Connecting with HENRY CHANCEY, Capt. Maury.

December 19th—CONSTITUTION, Capt. J. M. Cavalry.

Connecting with the RISING STAR, Capt. Howe.

December 29th—GOLDEN AGE, Capt. W. P. Laplace.

Connecting with OCEAN QUEEN, Capt. Gray.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Inman Line, can be obtained at office P. M. S. S. Co., San Francisco.

For Merchandise and Freight apply to Messrs. WELLS, FAROE & CO.

The splendid steamship COLORADO will be dispatched for CHINA & AUSTRALIA, January 1, 1887.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

California Steam Navigation
COMPANY.

Steamer CAPITAL.....CAPT. E. A. POOLE.

CHRYSOPELIS.....CAPT. A. FOSTER.

YONEMITE.....CAPT. W. BROWLEY.

CORNELIA.....CAPT. E. CONKLIN.

One of the above steamers leave BROADWAY WHARF at 4 o'clock P. M. EVERY DAY (Sundays excepted), for Sacramento and Stockton, connecting with light-draft steamers for Marysville, Colusa, Chico, and Red Bluff.

Steamships ALIX, PACIFIC, ORIZ, CALIFORNIA, ACTIVE and SENATOR, leave, as advertised, for Honolulu, Portland, Oregon, New Westminster, British Columbia, Victoria, V. I., Santa Barbara, San Pedro, and San Diego.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Its correspondents are men of science and learning, and hail from all parts of the coast. It is published at San Francisco, at \$5 per annum, or \$5 for six months. Address DOWEY & CO., publishers of MINING PRESS, San Francisco. (Nye County News.)

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

ANSTED'S Gold Seekers Manual. 1 vol.	1 75
Antiseil.—The Manufacture of Photogenic or Hydro-Carbon Oil, from Coal and other Mineral Substances, capable of supplying Burning Fluids. By Thomas Antiseil, M. D. 1 vol. 8vo.	3 00
BUCKLAND (Rev. Wm.)—Geology and Mineralogy. 2 vols. 8vo. cloth.	10 00
DUFRENOY.—Mineralogie. 5 volumes, 8vo. cloth.	20 00
DANA'S Manual of Mineralogy. Revised edition. 20 illustrations. 12mo. cloth. New Haven. 1853. School Edition.	2 25
DANA'S Manual of Geology. Numerous Illustrations. 8vo. half morocco. Philadelphia, 1883.	6 75
DANA'S Text-Book of Geology. Illustrated. 12mo. cloth. Philadelphia, 1861.	2 00
ELDERHORST'S Blowpipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1866.	1 50
FAIRBAIRN.—Iron: its History, properties, and Processes of Manufacture. By Wm. Fairbairn, C. E., LL. D. 1 vol. 8vo. New Edition.	4 00
FEUTCHVANGER.—A Treatise on Gems. 1 vol. 8vo. cloth.	1 75
GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, and Mercury, from the German of Th. Bodenmann and Bruno Kerl. 1 vol. 12mo. cloth.	2 50
HUMBLE.—Dictionary of Geology and Mineralogy. Third Edition, Revised. 1 vol. 8vo. cloth.	9 00
HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth.	16 00
KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada; also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. Illustrated by accurate engraving. 1 vol. 8vo. cloth.	6 00
LAMBORN.—Rudimentary Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated.	1 00
LAMBORN.—Rudimentary Treatise on the Metallurgy of Silver and Lead. 1 vol. 12mo. limp cloth. Illustrated.	1 00
MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth.	10 50
MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By H. Makins. 1 vol. 12mo. cloth. Illustrated by upwards of 50 engravings.	3 50
OVERMAN (Fred.)—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgical Operations. 1 vol. 8vo. cloth.	7 50
PIGOT.—The Chemistry and Metallurgy of Copper. By A. Snowden Pigot, M. D. 1 vol. 12mo. cloth.	2 00
PHILLIPS AND DARLINGTON.—Records of Mining and Metallurgy; or, Facts and Memoranda for the Use of Mining Students and Smelters. By J. A. Phillips and John Darlington. 1 vol. 12mo. cloth.	4 00
PERCY (John).—Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth.	13 50
PLATTNER AND MUSPRATT on the Use of the Blowpipe. 47 Diagrams. Third edition, revised. 8vo. cloth. London, 1854.	6 00
Practical Use of the Blowpipe; being a Graded Course of Analysis. 12mo. cloth. New York, 1858.	2 00
SCOFFER'S Useful Metals and their Alloys. 1 vol. cloth.	5 50
SMITH'S Blowpipe.—Vade-Mecum. The Blowpipe. Characters of Minerals Alphabetically Arranged. 8vo. cloth. London, 1852.	1 75
URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London edition. 3 vols. 8vo. cloth. New York.	16 50
WHITNEY.—A Geological Survey of California. Report of Field Work from 1850 to 1854. By J. D. Whitney. Part. Vol. quarto. 1855.	3 75
WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth, 12mo. San Francisco, 1863.	1 00

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices.

Baldness! Baldness!!
CAN BE PREVENTED, BY USING
Mayhew's Balsamic Hair Stimulant!

THIS PREPARATION HAS BEEN USED AND RECOMMENDED by some of the most prominent members of the medical profession of this city.

For the removal of DANDRUFF, SCURF, for preventing the Hair from falling off, and for producing a new growth, IT IS WITHOUT A RIVAL.

For particulars and references, see circulars accompanying each bottle. Prepared by

W. E. MAYHEW, Druggist,

N. W. Corner Fourth and Howard streets San Francisco.

He gives his personal attention to the preparation of Physicians' prescriptions.

Also, has constantly on hand a choice assortment of French, English and American Toilet Articles

16 1/2 x 6 1/2

Our Patent Agency.
THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been organized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

To Copper Miners and Others Interested in the Working of Copper Ores.

THE UNDERSIGNED HAVING BEEN APPOINTED Agent and Attorney by N. Haskell, for the sale of his PATENT SMELTING FURNACE, which has proved a perfect success in preparing to furnish the same to parties having Copper Ore, or will make arrangements to buy their Ore, receivable at their mines. For further particulars, apply to JOHN N. HASKELL.

21 1/2 At Coffey & Risdon's, San Francisco.

MARTIN & CO.,

Office, Stevenson House,

Corner California and Montgomery streets (up stairs)

WILL CONTRACT FOR THE

PURCHASE OF COPPER ORES.

Assaying eight percent, and upwards of Copper to the ton. We will make advances upon Ores of Copper.

San Francisco, Post Office Box 1259. 22

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character. After a careful analysis has been made

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the Silver Mountain *Bulletin* of Nov. 24th: The Mountain Company are driving ahead, and are near the completion of their 1,000 feet in, from the mouth of their lower tunnel. . . . The Lady Elgin Company are blasting away in their mine, and are making splendid headway. From indications in the face of the tunnel, they are very near their ledge. . . . The Pennsylvania Company are running day and night. . . . The Active Company have concluded to commence operations on their claims, by sinking a shaft on the Constitution lode. . . . The I. X. L. Company will soon issue proposals for tunneling in their mine. The sale of delinquent stock on assessment comes off on Monday the 26th; soon after which the managers will be prepared to commence operations.

The balance of the machinery for the George Washington mill is on the way, as it left Shingle Springs some days ago, and may be expected by the last of the coming week. Work in the mine is being prosecuted steadily, the ore improving in character, and the pay vein increasing in thickness, it being now full three feet.

From the Alpine *Miner* of same date: The new shaft in the American mine is now down about ten feet, and the work of grading for the building to cover the boiler, engine, and hoisting works partly completed. . . . Work is commenced on the Mowyer tunnel. W. H. Seaman has the contract for mining fifty feet. . . . Work is soon to be commenced on the James Barrett claim on Red Hill. A contract has been let for fifty feet. . . . The tunnel of the Schenectady Company is now in the Tarsbush ground a distance of nearly 350 feet. Small veins, or leaders, of quartz-bearing ore of good quality are found at every step, indicating the approach to a ledge.

We have received from Professor Kph, of Virginia, an assay bill of a parcel of ore sent him a few days since which shows a value in gold \$1,992.17, silver \$107.84, copper about 15 per cent, or \$60, making a total of \$2,160.01, or over one dollar per pound of ore, above the estimated expense of mining and reducing. This ore was taken from a mine in Alpine county, not many minutes walk from Monitor.

Butte County—

From the Oroville *Record* of December 1st: Ross & Co. are working the old Stag Point claims, that were abandoned several years ago, and have struck rich dirt. They found several slugs this week worth from ten to fifty dollars. Williams & Co., of Laskin, are putting up a large mill on their ledge. The rock is very rich, and no doubt they will make a fortune.

Calaveras County—

From the *Chronicle*: Hecrchner, Myers, Wesson & Co. are making rapid progress in the development of their lead near the Middle Bar. A tunnel seventy-five feet in length has been run directly on the lead, disclosing a vein five feet in width, every pound of which contains gold. From assays which have been made, it is demonstrated to a certainty that the rock, as it is taken from the lead, unassorted, will average twenty-five dollars per ton. It is the intention of the company to erect a mill as soon as they complete their tunnel the distance of a hundred feet. The greatest activity prevails throughout the entire district, and not in a single instance have we heard of labor becoming discontinued on any of the claims. Intelligence from the Whisky Slide district continues flattering. New discoveries are constantly being made in that new locality. Wallace, Cockley & Co., owners of the famous "Whisky Slide lead," since striking the large body of enormously rich quartz at a depth of 100 feet, have contracted for the erection of a large mill, and commenced sinking a new shaft. Matthews, Foster & Co., whose claim is in the same district, have sunk a shaft 112 feet, opening one of the best defined, solid veins of gold-bearing quartz, six feet in width, we have ever seen. Two tons of rock taken from this lead and crushed at Harris mill, in Sandy Gulch, yielded \$44. We are informed that the ledge increases in width and richness as the work progresses. Williams & Co., in the same district, have recently commenced work on a lode which promises to equal the other in richness. Although their shaft has been sunk but twenty feet, they are taking out some remarkably fine rock. They are busily engaged in prospecting, and bid fair to develop a valuable mine.

We continue to hear the most cheering news from Railroad Flat. Hepburn & Co's mill will soon be completed, and we understand that rock sufficient to keep it crushing for six months has already been hauled. The completion of the mill will afford the miners of that locality ample facilities for testing, and working their claims, and, in our opinion, demonstrate the

fact that Railroad Flat is one of the richest mining districts in the county. From West Point, Sandy Gulch, Mosquito and Rich Gulch, the reports are most favorable, and the glittering dust is being taken out in great quantities. Machinery is being erected, abandoned claims re-opened, and new claims discovered.

El Dorado County—

From the Placerville *Democrat* of Dec. 1st: Rich and extensive diggings were discovered some days ago on Poverty Point, above the New York mill, near this city. The vein seems to be a mixture of decomposed quartz, sandstone and soapstone. It runs north and south, and varies in thickness from one to twelve feet. The gold is entirely in the sulphurets. It was discovered in the claim of Mr. Henson. Chunks of solid gold are found in the lode. Very rich specimens have been taken from it. If carefully worked it will average forty dollars a ton, and millions of tons are in sight. It can be got out without much trouble and expense, and crushes easily. Capitalists from Nevada, Governor Blasdel, Senator Hains and others, have examined it, purchased claims and are working them.

A correspondent of the same paper, writing from Georgetown, November 28th, says: Our quartz interests are in no way lagging. The Collins Company are prosecuting the work on their tunnel, which is now in about two hundred and seventy feet. The rock is full of gold-bearing sulphurets, in many of which free gold can be seen by the eye. The Alpine, first northern extension of the above, are also vigorously prosecuting the work on their tunnel, which is now in about one hundred and eighty feet. They expect to reach the ledge in about ten or fifteen feet. They have been at work nearly six months, and have expended about \$800. The ledge is located about four miles from town, in a southerly direction. The Woodside ledge still maintains its richness, but is being worked in such a manner as not to make such an excitement.

From the Placerville *Courier*: A bed of cement extends from Smith's Flat to Coon Hollow, a distance of about six miles, and pays about \$10 a day to the hand, with proper machinery to crush the cement. Stewart & Hall are erecting a mill on their claim at Weaver Hill, about two miles south of this city, and will have it in running order in about two weeks. They are running a tunnel on the Scott claim, adjoining on the west, and expect to strike the cement in a few days. The Folsom claim was sold last week to Mr. Webster, of Nevada City, for \$3,500. This is quite an extensive claim, and a mill is being erected upon it.

Kern County—

From the Havilah *Courier* of Nov. 24th: From a private letter we learn that the mines in Greenhorn District are, as usual, turning out well. The Alpine Company, in their last run, paid about \$35 per ton. Mr. Lewis has cleaned up about \$40 per ton. The Little Bros. are doing well with their rich claim. The Mammoth Company have struck it very rich at 200 feet—"richer than anything I have seen in the country," says our informant. It is the west strata of the Mammoth, and is about two feet and a half wide.

Mariposa County—

From the *Gazette* of Dec. 1st: Messrs. Dyer & Co., of San Francisco, have purchased the claim of the defunct "Hornitos Gold and Silver Quartz Mining Company," and are now pushing on active operations. About 100 tons of rock from one vein are now being crushed; if this does not turn out well another vein will be tested. Things are looking more hopeful around Hornitos than they have for some time. Bancroft & Thurman took out 44 ounces last week. Nelson & Son drew \$1,200 from one hauler, and \$700 from another. Moore & Carlow cleared 200 ounces in three weeks. The latter claim is near the Hornitos Company's mill.

The Colterville correspondent of the same paper says: Business of all kinds has received a considerable impetus recently—principally owing to the rich and extensive discoveries made of gold-bearing quartz in the neighborhood. The Colterville Company's ledge, (known as the Lonisa vein,) immediately below town, is being prospected by Chamberlin & Douglas. They have leased the mill known as the "French Mill," and will have erected all necessary machinery for amalgamating purposes in the course of about ten days. At the Pino Blanco, two miles from town, Dr. McLean has discovered some exceedingly rich rock on his ledge, and is making preparations for testing it. Mr. Flannigan and Mr. Robert McKee have been among the lucky ones at Bear Creek. One prospect alone, of four pounds of rock, yielded about nine ounces of gold. The Messrs. Heslep, at the "Lonisiana," are crushing about ten tons of ore daily, employing from fifteen to twenty hands, with good results.

Nevada County—

From the *Gazette* of Nov. 29th: The mill of the Oro Fino Company, situated on Rush

creek, has lately been rebuilt and placed in complete order for effective work, and will be started up again next Monday. The mill has six stamps, and it is the calculation to keep it running constantly hereafter. Since last spring, the ledges owned by the company are the Oro Fino, the John Bull and the Middle, and besides these they have leased the Yellow Diamond ledge, situated in the vicinity. The John Bull ledge has been opened by a tunnel 425 feet in length, from which they are now taking rock, the ledge being two and a half feet in width.

From same of Dec. 1st: On Saturday last, the Gougeye Cement Company, at Hunt's Hill, cleaned up \$1,350, after a run of four and a half days.

From same of Dec. 4th: The Inkerman mine was located in 1864, and has been worked almost continuously ever since. The main shaft is now down about sixty feet, and a tunnel has been run opening the ledge to a depth of four hundred feet. At this depth, the ledge is about twelve inches in width, and the mine promising.

Same of 5th: The amount of quartz taken from the Henston Hill mine, will probably reach 125 tons a month, and the average yield of the rock is about \$100 a ton. The cost of mining and reducing the ore is \$40 to \$45 a ton. The company have within the past year, erected new hoisting works at a cost of \$30,000, and divided \$60,000 among the stockholders.

From the Grass Valley *Union* of Nov. 27th: We have been informed that after a two week's run of the Gold Hill mill, upon rock taken from the Consolidated Wisconsin and Illinois mine, six hundred ounces of amalgam were cleaned up from the batteries. The crushing is not yet quite completed, and it is thought that when the work is through, the company will realize at least \$15,000 in gold as the result of the twelve days' run.

It is said that a very rich vein has been struck in the Norambagna mine, and that rock is now being taken out which will yield \$100 per ton.

As proof of the richness of the Union Hill mine, we will state that we yesterday saw a bar of gold weighing three hundred ounces and valued at nearly \$6,000, the result of five days' run of the mill.

We yesterday feasted our eyes upon an immense bar of very handsome gold, from the North Star mine. We didn't succeed in getting at the exact value of the lump, but we know that it took all the weights in Findley & Co.'s bank, and an extra one, too, to balance the scale containing the gold. And this chunk was the result of only one week's run of the North Star mill, and with but five stamps running at that.

From the *Transcript* of Nov. 28th: The Banner Mining Company are about having four additional pans set up in their mill. The mill will then have eleven. From the mine the company continues to take excellent rock, and the ledge is now from five to seven feet thick. . . . The owners of the Oro Fino mine expected to start their mill up yesterday. They have a large amount of rock out for crushing. . . . The Eagle Company's mill at Grizzly Cañon, was ready for work on Monday, but the ditch conveying water to the mill was not of sufficient capacity and had to be enlarged. The improvement is completed now, and the mill will be kept constantly at work. A large amount of rock is on the surface, and is of superior grade.

The Ancient River Channel Blua Gravel Company have commenced sinking a shaft at Bear Valley, and are now down thirty-five feet and have come to hard gravel. They expect before reaching the bedrock to go to a depth of about one hundred and eighty feet. Buildings and machinery are up, and the work of sinking the shaft is being rapidly increased.

Same paper of Dec. 1st, says: The late storm has filled the reservoirs and ditches of the miner, and gives an ample supply of water for mining purposes throughout the county. The preparations for mining this season are more extensive than ever before, and larger tracts of country will be worked before the end of the season.

EXCELSIOR.—From the Meadow Lake *Sun* of Nov. 24th: The Enterprise machinery proved an entire failure, and has been taken down. The California mill is in excellent working order, and only awaits ore from the Knickerbocker ledge to resume operations. The Winston mill, about the first of the month, passed from the hands of the Mohawk and Montreal Company to its present lessees, and was started on Wednesday last with an additional battery. The Excelsior mill has closed, and will remain inactive until it can receive some alteration. The U. S. Grant mill is now running and doing good work. The new mill of the Mohawk and Montreal Company will commence about the first of next month. The Reduction Company will soon make a strike with ten good stamps. The Golden Eagle Company design starting a mill shortly. The frame work is finished, and the machinery will soon be set up and in operation.

Placer County—

From the Auburn *Stars and Stripes* of Nov. 28th: The Charles Mallet Co. recently crushed a quantity of rock taken from the fifty-foot level of their mine at Ophir, which yielded at the rate of \$10.50 in free gold and upwards of \$30 per ton in sulphurets. Capt. Mallet informs us that he is now taking rock from the 104-foot level, where the ledge is six feet from wall to wall, which looks better than any heretofore taken from the mine.

On the Wells lead, the incline shaft is now down twenty-nine feet. The vein is three feet wide, and some specimens of the rock left at this office show free gold.

Since our last issue, Mr. Wm. Holdredge, agent of the New York and California Mining Co., has a conditional purchase of the two leads known as the Conrad and Jackson, located about one mile from town. He will at once proceed to run a tunnel 700 feet in length, to strike the ledge very low down.

From a private letter we learn that the St. Lawrence claim, in Ophir district, opens up remarkably well. A six-stamp mill is to be erected at once. The indefatigable Roberts, who is superintendent, says he will have it running by New Year's morning.

From the Dutch Flat *Enquirer* of Dec. 1st: We learn that several companies that had taken the due advantage of the "dry season" have commenced washing in the neighborhood of Gold Run, procuring the required amount of water from the ditches of the Dutch Flat Water Company, which have been partially filled by the late rains.

Plumas County—

From the *National* of Nov. 24th: About three weeks ago Mr. McCarger struck a fine quartz vein on the hill about one and a half miles south east of town, which he has named the New Discovery. He has had the claim surveyed, and has prospected some of the rock, which seems to be very rich. . . . Ellis & Wilbur, of Mill Creek, have nearly completed a large water power derick for the purpose of working claims. . . . Mr. Eleazar Light has a company of hands at work erecting a quartz mill upon the old Ward ledge in Genesee, and has himself gone below for machinery.

In Plumas City, the Plumas quartz mill, with twenty-four stamps, it is expected, will be in full blast within six weeks. A number of new claims have been located within the past month, from some of which very rich rock has been obtained. . . . In Greenville, quartz stock is looking up of late, having taken a fresh start from recent rich discoveries. Many new buildings are being erected, and active preparations are making for business as soon as spring opens.

From the Quincy *Union* of Nov. 24th: The quartz mill of Tombs & Co., in Washington township, was destroyed by fire on the 2d of Nov. . . . In the beds and banks of Grizzly Creek all the companies except one have suspended operations for the season on account of the scarcity of water. The season, as a general thing, has been a profitable one. The Forest Hill Mining Company, (Bickford Bros. & Co.) on the gravel range between Grizzly Creek and Ward Creek, finished laying their pipe in the middle of September, and since then have been engaged in running through the rim rock. Their prospects are good.

Sacramento County—

From the Folsom *Telegraph* of December 1st: Palmer & Day's quartz mill, at White Rock, continues steadily at work, and is crushing large quantities of rock, which we are informed is paying well.

The cement workers on Maine Flat are doing well. On the Folsom side of the river a shaft has been sunk over twenty-five feet in depth; on the brow of the bluff, twenty feet being through what has hitherto before been considered the bedrock. A stratum of cement was then struck about two feet in thickness, which shows good prospects. This cement rests upon the granite. It is believed that the cement under this town lies at a depth of from eighty to one hundred feet, and possibly deeper. The new discoveries cannot, on this side of the river, be thoroughly prospected until next spring, on account of water.

Shasta County—

From the *Courier* of December 1st: The Tornado company cleaned up last Saturday, after a short run, the sum of \$400. Encouraged by the favorable prospects obtained in the claims of this company, others are engaged in opening claims adjoining, and are finding good indications of pay. . . . On Whisky Creek, more mining will be done the present winter than for two seasons past. . . . Every thing is lively at Churntown. . . . At Pittsburg the Worley boys are making good wages in Tom Creek. Anderson Tetric is taking out from five to ten dollars per day from his claim on Bolly Hill, and Burgoon and Williams continue to flourish on the proceeds of the Bamboo lead. Nothing has yet been done towards erecting the proposed smelting works on the Kellinger claim.

At South Forth, nothing has been done on the Chicago at present, but work will probably be resumed in a few weeks. Operations still continue on the Pacific, Ohio and Crystal. The Crystal presents a particularly favorable appearance, and the rock assays almost fabulously rich in gold and silver.

Several assays have been made during the week upon rock taken from the Red Warrior claim, located in the South Fork district, and the lowest result obtained was \$270 in gold and silver, gold predominating. We committed an error last week in reporting the amount cleaned up by the Honeycomb mill. We should have said 234 ounces, or \$3,850.

Sierra County—

From the *Messenger* of December 1st: At Gibsonville the Washington Co. have run their main tunnel ahead, and struck a new load of fine looking gravel, with fair prospects. The Nevada claims at the same place are still panning out their measures. As proof of this, I will only mention the fact that Charles Canny & Bro., who are old miners at Whisky, paid the nice little sum of twelve thousand dollars for two and a half shares in the Nevada a few days ago.

At Port Wino, the gravel and cement digging of Cole & Stephens, and other companies at Brandy City, are about being sold to a New York company if the terms can be agreed upon. Cement mills will be erected. Claims about Dutchman Ranch, Poverty Hill, etc., continue to be taken up, and there is a prospect of vigorous action in that section in the spring.

The Monte Cristo claims are paying better than usual, with prospects of water to wash their dump. The Eagle boys are getting into better prospects, and the Irish company are ready in their hydraulic claims and intend to pipe off the ground up to the road above town. The Pioneer Tunnel company have struck soft rock again, and are getting along satisfactorily.

Siskiyou County—

From the *Yreka Union* of Nov. 24th: After a two week's run, Messrs. Lash & Hawkins cleaned up last Saturday thirteen pounds of gold.

At Indian Creek, S. S. Richardson, the Superintendent of the London Quartz Mining Company, is engaged in putting up three hydraulics, one on New York Gulch and two on White's Gulch.

Yuba County—

The *Appeal* of Dec. 1st says: The Jefferson Company, at Brown's Valley, on the 25th of Nov., struck another "chimney" which turns out the richest rock we ever saw from Brown's Valley. This vein was struck at a depth of five hundred feet. The richness of this rock will soon make good all deficiencies caused by the late cave.

Washoe—

NEVADA.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Virginia Union*: The heavy new pump engine of the Gould & Curry mine, at the Bonner shaft, has started into full operation, and reduced the water in the mine down to the 625-foot level. It is still 100 feet deep down to the lower or 725-foot level, and when the water is all pumped out, sinking the shaft will be resumed once more, after the lapse of nearly a year. On Saturday last a large stream of water was struck in the Imperial and Empire shaft, at Gold Hill. Workmen, since that time, have been engaged in bailing it out, and have prevented it from gaining on them. To-day the water does not flow in as rapidly as it did at first, and the work of sinking deeper will soon be resumed. The Yellow Jacket is putting in a new pump. The Crown Point Company is taking out an excellent quality of ore from the 400-foot level of that mine. A strike for old wages, viz: \$4 per day, is rumored. It is stated that the Imperial mines has acceded to the demands of the miners, and will continue to pay \$4 per day.

The editor had visited the Sierra Nevada mine, upon which a new shaft was commenced some months ago. After describing the several drifts, he thus proceeds: Ascending to the surface, we view a huge ledge, 200 feet wide and stripped 600 feet in length, which has every characteristic of the croppings of Gold Hill proper, and is known to miners as brown quartz, containing gold. A quantity of this ore has been milled, and rendered, on an average, \$16 per ton. In January, this ore will be mined for reduction, and the quantity is beyond computation. The company will soon erect in the ravine, below the shaft about 100 feet, a fifteen-stamp mill, for the reduction of this brown ore. It will be built like the Nevada county gold mills, without pans, and will crush fifty tons of ore per day, at a cost for mining and reduction of seven dollars per ton, leaving a marginal profit of nine dollars for each ton of ore.

From the *Enterprise* of Nov. 28th: Another big boiler has arrived for the use of the

Imperial and Empire Companies at their new shaft, making the fourth, and together with this steam enough can be generated to drive machinery of sufficient power to hoist ore from the depth of 1,500 feet. We are informed that the new hoisting works of the Kentucky Company at Gold Hill will start into operation to-day. The machinery is all new and very powerful, having two large boilers and a 50-horse power engine.

Reese River—

From the *Reveille* of Nov. 22d: We learn that the Knickerbocker mill, at Lone, has been put in good working condition, and is now hammering away on Great Eastern ore. Its furnaces, as originally constructed, proved to be defective, and they were taken down and rebuilt. The Knickerbocker mill has a battery of twenty stamps and six furnaces, and a well arranged and well furnished amalgamating department, and it cannot fail of success. The Great Eastern mine has ore in abundance that yields \$60 per ton.

From same of 26th: Kinsley district is situated in the Antelope range of mountains, near the eastern boundary of the State. It was discovered a year ago, but was kept quiet until recently. We are informed by Mr. John O'Dougherty, that some twenty-one ledges of silver and copper have been more or less opened. The Emmet, Sheridan, and Reilly, have been the most fully developed, and are each from four to five feet thick. The two latter contain copper ore of a high grade, assays of which give 35 to 50 per cent. of copper, and from \$60 to \$137 of silver per ton. The outcroppings of these two ledges are enormous, exhibiting masses of ore estimated at from 500 to 700 tons. It is a very singular feature of the district, that copper and silver veins occur in close proximity. The Emmett location is a handsomely defined silver ledge, which has been opened to the depth of twenty feet, at which point it is two feet in thickness.

From same of 27th: During the last week seven tons of ore from the Johnson claim on the Silver Champion ledge in the Silver Bend district, were delivered at the Keystone mill for reduction. The pulp assayed at the rate of \$162 per ton, and was worked within a small percentage of that figure.

Belmont, in the Silver Bend district, is improving rapidly, and begins to wear the appearance of a substantial mining town. Work is being prosecuted on the Highbridges with energy and system, and both the claims of Beul and the Gellier Company present splendid development of mineral. Twenty men will winter in Empire district, and perhaps thirty in Hot Creek.

Same of 28th: Yesterday afternoon Boalt & Stefelsdt received nearly 15,000 ounces of bullion from the Twin River Mining Company.

The country lying to the southeast of Reveille towards Pahraangat, is just now the scene of active prospecting. Parties have also gone to explore the country south of Silver Bend, from which come rumors of important discoveries of mineral. We learn, too, that a strong party of prospectors has traveled to the northeast, whose comparatively untrodden hills are believed to be rich in ores of gold, silver and copper.

Esmeralda—

From the *Miner* of November 24th: Kearsarge is beginning to tell its silver story. The last stage brought up 400 pounds of bullion, and we are informed that as much more is waiting for shipment.

The new mines on Walker River are attracting considerable attention, and quite a little village is being erected at the mines, which has been christened Wilsonville. We have also been informed that two mills will be erected at the mines—the Bodio mill from this place, and a mill from Gold Hill. The mines, so far as prospected, are proving all that their lucky owners could desire.

The rumor that the Salt Basin and Silver Peak Mining company intended suspending operations for the winter is a mistake.

The same paper has an article on the Crockett mine, in which it says: "There is a screw loose somewhere. We are of the opinion that there can be sufficient ore taken out within sixty or seventy feet of the surface to pay all the actual expenses of sinking on the mine if it were properly managed. But we will say to this company as well as others, that men should be employed as superintendents who have the reputation of being good miners, men of good judgment, and a small portion of that very necessary ingredient—honesty."

Black Rock—

The *Eastern Slope* of November 24th, says: Recent letters inform us that the tunnel on the Snow Storm has developed richer rock than was ever heretofore found on that famous ledge; that new and rich ledges are being discovered and located, and that the mill in course of erection will be ready to commence operations on or before the first of January.

IDAHO.

From the *Owyhee Avalanche* of Nov. 17th: The Cosmos mill is receiving eight or ten large

wagon loads of new machinery direct from San Francisco by the Humboldt route—such as new batteries, extra stamps, concentrators, shovels, dies, etc. Capt. Musgrave expects to be able to run the Cosmos the entire winter. They have out over six hundred tons of Silver Cord rock ahead of the mill.

The owners of the Donovan and Thomas ledge are at work sinking a shaft on the vein, and are already down forty feet. The vein in the bottom of the shaft is four feet wide and shows good casings. Several tons of ore are piled up near the top of the shaft, which appears to be rich with the metal.

A company of twelve Chinamen made \$1,500 in one week, at Silver City.

The *Idaho Times* of Nov. 13th, says: On Sunday last we made a flying visit to Pine Grove and the claims in the immediate vicinity. We found the miners considerably frightened by the sudden appearance of snow. They are still sanguine of being able to work until the first of next month. Several companies are working a full complement of laborers day and night. The village of Pine Grove presents quite a lively appearance.

Mr. J. H. Reed reports that the principal creek of the newly discovered mines on the North Fork of Salmon river will pay from \$5 to \$7 per day to the land, for a distance of twenty miles, and that two of its tributaries are equally rich. The gold is of good quality, assaying over \$17 per ounce.

From the *Wallis Statesman* of Nov. 16th: The Kootenai expressman brings a report that gold in paying quantities has been discovered at the Kallispelin Mission. A number of claims had been taken up, and it was thought that a permanent mining camp would be established. The new diggings are about 200 miles this side of Kootenai, and immediately join the Mission, from which the district takes its name.

The *Portland Herald* learns from a private letter, that astonishingly rich prospects had been discovered about thirty-five miles above the mouth of the Kootenai river. This story may have the same basis with the one mentioned above. If this be so, it is probably in Western Montana.

MONTANA.

From the *Post* of Nov. 17th: The St. Louis and Montana Mining Company have within the period of two months constructed a building 150 feet in length, which contains the engine, a blacksmith's shop, Scotch hearth, cupelling furnace and capola furnace. By the use of these means more than ten tons of ore can be run into lead every day, and eight tons of lead can be cupelled at one time. In addition to the two hundred tons of ore which will be furnished by the Legal Tender lode, about three hundred tons of ore, considered to be equal in richness to the former, has been taken from the Stapleton and Henry Clay leads. Wood, water and charcoal are abundant, and tons of silver will be produced during the winter.

Need Gulch, eleven miles south of Virginia City, is thirteen miles in length. The gravel yields from five to fifteen cents per pan, and the depth to the bedrock is only eight feet, but the distance is greater in the canon district. A drain ditch is being constructed. In Cave Gulch, three miles from New York, the diggings are deep and the dirt very rich, paying \$2.50 to the pan on the bedrock. Parties of three and four men are taking out from \$200 to \$300 per day.

Letter from Bannack, dated Nov. 9th, has these items: Montana City was all excitement at the success of Professor Steitz's furnace. He cupelled forty pounds of pure silver from the mine of the St. Louis Company at Rattlesnake. No. 6, Dacotah, to-day stands higher than ever before. The quartz from the deepest shaft gives the best returns. Next season the company will bring better and more machinery. The Salmon mine, on Baker's creek, and other gulches, all promise well, and we venture the assertion that there will be ten thousand people in there next season. The Bannack Ditch and Mining Company has just wound up operations for this year, with highly satisfactory profits, and a bright prospect ahead of larger "returns" next season.

The same paper has an editorial in regard to the mining prospects of the Territory. We quote: Companies have announced intentions to build mills, and we have good grounds for stating that more than twenty will be brought from the States within the next twelve months.

The *Alta* of Dec. 3d, quotes from a private letter received in this city, a few days since from Montana: "I almost curse the day I came here. I would rather pick rags in San Francisco for a subsistence, than remain here in affluence; and this first sunny day, which I suppose will come some time next summer, and when the snows are down to a traveling depth, I will take the coach for the 'other side,' and forever shake all countries that are not on the Pacific coast. Many Californians here, and all disgusted."

ARIZONA.

From the *La Paz Gazette* of Nov. 8th: The

Mohave reached La Paz on Tuesday afternoon. She brought the mill machinery of the Vulture Company, which will be forwarded to Wickenburg. From William's Fork, we learn that the Springfield Company with which Col. Ripley, Mr. Charles A. Crane, Mr. Hamilton and Mr. Bigler are connected, has been at work developing the Punta del Cobre, on which they are down about fifty feet, and have found a promising vein of high grade ore.

The *Los Angeles News* of Nov. 25th, quotes from a late new daily paper in Prescott: Several quartz mills were in operation at Lynx creek; a number of armstraws and a crusher were doing a good business. The Lyons furnaces are being introduced into Arizona.

COLORADO.

From the *Journal* of Nov. 13th: The Ophir Company shipped 468 ounces of gold last month, and will ship about 500 this. The Keith furnace has been started in the Manhattan mill. The Smith & Parmelee mill is again stamping, having put in a new boiler. The Consolidated Gregory also started its mine pump on Monday, to relieve the companies mining below it on the lode. Last Thursday the Sensitive G. M. Company declared a dividend of one per cent. on their capital stock of \$1,000,000, for the month of October.

The Smith & Parmelee Company have just made the largest retorting ever made in Colorado. The weight was 114 pounds; and value in currency \$3,500. It was the result of the work of a month and a day. The company expect to do better in future.

From the *Denver News* of Nov. 14th: The Colorado Mining and Exploring Company are sinking a shaft on one of their lodes in Sugar Loaf Mining District, Boulder county. They have a crevice showing three feet of quartz, rich in free gold. The company design erecting reducing works early next season.

Letter from Boulder to the *News* announcing the total destruction of the splendid mill of the Niwot Company.

Long's Peak Mining Company, in Ward district, is working the Comet lode, believed to be the eastern extension of the Columbia. The surface ore—a porous quartz, containing free gold—yields under stamps, from six to eight hundred dollars to the cord. At the depth of about thirty feet they have struck sulphurates of iron and copper, which pay four to five hundred dollars per cord, under stamps. The vein at that depth is about four feet wide, one foot of which is copper sulphurates which assay full twenty-five per cent. of that metal.

Same paper gives some statistics for the Territory, from which we extract the following: During the past year eight smelting furnaces have been built in the mining districts at a cost of one hundred and eighty thousand dollars, and fifty-eight miles of mountain road, built at a cost of sixty thousand dollars. The production of gold from the mines is much more than double that of last season.

UTAH.

The Salt Lake *Vedette* of Nov. 24th, has an article on "Iron and Coal in Utah," and the important aid in building the Pacific Railroad, which they will furnish. We quote: We know of no reason why the rails and all the iron work for the road from Denver to Reese River, Nevada, should not be manufactured in the vicinity of this city—we have the iron ore and the coal, and our mountains can supply the needed timbers. Moreover these mines of iron and coal are located in the heart of a rich, fertile and populous agricultural region, capable and ready to supply the necessary provisions for the sustenance of a manufacturing community without the great cost of long transportation.

A SELF-ACTING "STATION INDICATOR" has been invented by a Pennsylvanian. It is placed at the end of a passenger car, in full view of the occupants, who can therefore at any moment read the following: "The next station is Springfield," (or whatever it may be). An endless band upon which the names are inscribed, in the proper order, is enclosed in a box, and each name is in turn brought to view. It is operated by means of a lever, which projects beyond the side of the car within reach of a post beside the track at each station. Should the car be backed, the lever is reversed, so that the reading is always correct. Those who have experienced the difficulty of hearing the announcement of the conductor in the old way, often indistinctly made, and that too at the last moment, will appreciate the improvement.

A BURGLAR-PROOF SAFE LOCK has been invented by a man in Rochester, N. Y., which is claimed to be superior to all others. Its peculiarity consists in a magnet, which retains the catch in such a position that not even the slightest movement can indicate the position of this tumbler, to one who is attempting to pick the lock.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING and SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 26, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

Mr. Thos. J. Hall, is an authorized agent for this Journal for the northern counties of this State. Dec. 1, 1866.

Mr. F. F. Frost, is an authorized agent for the Press for Amador and Calaveras counties. Dec. 1, 1866.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

San Francisco:

Saturday Morning, Dec. 8, 1866.

NOTICES TO CORRESPONDENTS.

A. C.—In our observations last week, we omitted making allusion, in our notice of the diamond and topaz, to a circumstance which has gone the rounds of newspaper paragraphing, connected with a peculiar example of physical change in a diamond exhibited by M. Fremy, at the meeting of the *Academie des Sciences* of Paris, on the seventh of May last; we did so for a reason which will be explained hereafter. The diamond alluded to weighed upwards of sixty grains, and is described as being of a slightly yellow tint, but which changes on being submitted to an elevated temperature, to a rose-red color, which it maintains for several days, gradually returning to its normal yellow appearance. Thus, the diamond, although rose-colored at one *seance*, will, if preserved in the cold state in the cabinet of the Institute until the next *seance*, again exhibit its normal yellow color. It is considered that this is the first instance known of a diamond displaying variable colors. Many Brazilian topazes possess a yellow cast, which often permanently disappears and becomes colorless, on being subjected to a high temperature. These are not unfrequently disposed of to the uninitiated as genuine diamonds, and are known by the corrupted title of "over miners" amongst the less educated Hebrews, who are the most apt to be peddling such matters. The term is a corruption of *nova mina*, itself a transposition of *Minas Novas*, a province in Brazil, where these gems are principally found. Many yellow topazes, however, change their color by heat to that of the balos or rose-red ruby, in which case they are usually passed off as the spinelle, and sometimes as the Oriental ruby, from which latter its rose-red color may easily be distinguished. Some sapphires and rubies, especially the spinelle varieties (usually compounds of magnesia and alumina), have their tints changed and colors discharged by means of heat—the change, however, is permanent, not variable. These changes of color are probably due to the greater or less state of oxidation of very small portions of iron and manganese alone or mixed; the latter metal is well known in chameleon mineral to afford a wide scope of colors accordingly as it may be chemically associated. The ordinary price of a diamond of similar weight to the one above noticed is usually 60,000 francs (more than \$10,000); if the rose-red color was permanent, the value would be tripled. The paragraph alluded to, omitted the italicized word, and caused us to wait further information. This example only affords another to the numberless instances of erroneous ideas being spread by the continued iteration of an original error of omission or misconception.

C. M. C., PORTLAND, OREGON.—Water-tight, underground apartments can only be made by the construction of well cemented walls; and in many cases, where the pressure is considerable, or the foundation porous, by covering the center area composing the floor with solid concrete of about a foot in thickness, for which purpose hydraulic cement will have to be used. We anticipate these methods will be found too expensive in your city, as compared with the benefit to be derived. We have no definite knowledge with regard to the water-tight cellars in the European cities named, but presume they are constructed in the above manner. No difficulty will be encountered from the pressure where it does not exceed ten feet. In cases where the foundation is not too porous, the thickness of the concrete may be lessened three or four inches, by making a sub-flooring of rammed puddled clay, of from eight to twelve inches in thickness. Clay itself, well rammed, will occasionally keep out water; but to be safe, and obtain a quite dry cellar, a concrete coating may be found requisite.

C. E. S., COLORADO.—The chlorination process (Plattner's) is now in successful operation in both Grass Valley and Nevada City, Nevada county, California, also in two or three other localities in the State. The works to which you refer in this city have been discontinued. We published a brief description of this process in our issue of July 27, 1863, which we forward you by mail.

CEMENT MILLS.

It is well known to all who are conversant with the mode of working the hard cemented gravel, from what are known as "cement diggings," that with few exceptions all the gold obtained is from a very small portion of the material crushed. The gravel proper taken from these mines is merely the fine material that has been packed into the interstices between the boulders which comprise the chief portion of the mass with which the old river beds have been filled up. The largest and hardest of these boulders can generally be taken out very free from the cement, and are thrown into the waste heaps; but there is a large portion of the smaller boulders, from the size of birds' eggs up to those of five or six inches in diameter, which are comparatively rough, and owing to that peculiarity it is found very difficult to remove the auriferous gravel from their surfaces; hence, they are broken up like quartz and thrown into the battery. This process involves the crushing of a large mass of what is known to be worthless material, which comprises by far the largest portion of that which is put through the battery. This necessity involves a large amount of cost and greatly increased difficulty in saving the gold, by reason of the necessity for rescuing it from such a large mass of refuse.

Various devices have been resorted to, to remove the cement from these numerous smaller boulders, so as to avoid the necessity of crushing them. Among others, an arrangement similar to the Freiberg barrel has been introduced, into which the boulders with the cement are placed, and by the attrition arising from the revolution of the barrels, which may be assisted by hot steam, the adhering cement and gold is worn off, the cement dissolved and reduced to fine gravel, by which the gold is liberated so as to be readily amalgamated with the quicksilver. We see no reason why this process should not work well.

Some time since, a gentleman of our acquaintance suggested a conical-shaped machine, into the lower and smaller extremity of which he proposed to introduce a powerful stream of water, similar to that thrown from a hydraulic hose. Within this and from the upper surface he suspended a emeller cone, with its apex also downward. Into this machine, through a proper opening, the boulders and cement were to be thrown. The action of the water would keep the mass in violent agitation, projecting the boulders against the overhanging cone and against the sides of the main machine, by which action, and from attrition against one another, the boulders would be freed from the cement, and the cement itself reduced to pulp, and ejected through proper screens arranged around the sides of the machine near its center, while the boulders made their escape, automatically, in another direction. We believe this idea was never put into practice, although a machine was nearly completed at the Union Iron Works for the party above alluded to.

The question involved, however, is a very important one; and any person who will devise some cheap, efficient, and rapid mode of accomplishing the end desired, will confer a most important benefit upon this great and growing branch of mining industry. We should be pleased to hear suggestions from our correspondents with reference to this matter.

SHERMAN'S MARCH THROUGH GEORGIA has been immortalized by Mr. Thomas Nast, a young artist of New York. The selection of the subject has been most happy, and the particular incidents and grouping depicted, are eminently historical and suggestive. This picture has been purchased by Messrs. Snow & Roos, and was exhibited by them to a private circle of invited friends on Thursday evening. The artist has executed his work in a manner and style with which but little fault can be found, by even the most exacting critic. Messrs. Snow & Roos are entitled to much credit for the energy and enterprise displayed in securing this valuable work of art for the Pacific coast. We understand that it will be placed on public exhibition at their picture room, 219 Montgomery street, when it will doubtless be made a careful study by the public of San Francisco.

NOTES OF TRAVEL.

NUMBER THREE.

A ride through Santa Clara Valley is one eminently suggestive—not indeed of grandeur and sublimity; for as the lofty mountain, the deep cañon and the rushing torrent are wanting, there is nothing there to produce the wonderment inseparable from the idea of grandeur; or the sense of fear, which is equally inseparable from the impression of sublimity. In harvest time, the eye wanders eagerly over yellow fields, rich with golden grain, and beautiful vineyards and orchards loaded with luscious fruit, interspersed here and there with elegant manions, but more frequently with the quiet and unostentatious abodes of thrifty husbandmen. It is true the beauty of the scenery is essentially marred by many rude structures, but illy calculated for the promotion of either refinement or comfort; but even these are eminently suggestive of the wonderful change which has of late years come over the minds of the people of this State, since the time when only the most far-sighted thought the Pacific coast could ever become the home of a thrifty and refined population.

THE MAGNITUDE OF OUR AGRICULTURAL RESOURCES.

Experience has proven that not even the Valley of the Nile, or the vine-clad hills of France, can successfully compete in variety and productiveness with this most beautiful garden spot of earth. While other parts of the State may stand still or retrograde by a process of exhaustion and gradual yielding up of their mineral treasures, this beautiful valley must go on, year after year, increasing in wealth and loveliness; for its prosperity is based upon that true foundation of national wealth, which neither storm nor flood can shake, and which no amount of judicious extraction can ever exhaust of its precious treasure of yellow, golden grain, more valuable and more enduring than even the glittering dust of its mountain river, because of its capacity of eternal, perennial renewal.

California, limited as she is in the development of her agricultural resources, is to-day furnishing bread to the hungry in almost every part of the world. In addition to the steady stream of metallic wealth that is constantly flowing out through the Golden Gate, to replenish the coffers of the wealthy, and sustain the financial credit of Europe and America, the ships of California, loaded with the golden products of her fertile valleys, are now wending their way, by different tracks, to every quarter of the globe, bearing food to the hungry mouths of the Atlantic States, of Europe, of Asia, of Australia, of Japan and many smaller islands of the Pacific ocean. Many thousands of tons of this year's crop have already gone forward, and more than 200,000 additional have been accumulated in stores and warehouses almost innumerable, until there are scarcely ships enough in the broad Pacific to bear them away. This is but the beginning of our agricultural prosperity. Who can count the immensity of wealth which must pour in upon us, when capitalists shall have built the railroads necessary to reach and remove the annual products of the millions of our fertile acres which yet lie idle for the want of those necessary helps to their development?

SHORT-SIGHTED POLICY—BURNING UP TREASURE.

It seems as though some of our agriculturists have become intoxicated with the prospects of present and future wealth, and are actually studying to relieve their lands from their present apprear over productiveness. At least, such were the impressions forced upon our mind as we passed to and fro, in various directions through this beautiful valley, and beheld the numerous fires, with their dense columns of smoke, as they rose up in every direction from the broad fields which surrounded us. Of course this is not peculiar to Santa Clara Valley. It is the almost universal practice for our ranchmen to burn the straw and all dry refuse on their ranches, as a means of ridding themselves of such incumbrance, preparatory to the next season's plowing. This is usually done immediately after the first rain, when the ground and stubble is sufficiently moist to remove any special danger from the spreading of fire. In the evening, great numbers of these

fires can be seen; sometimes in fact the whole horizon seems aglow. Such scenes may be witnessed, in their season, from this city, by any one who will take the trouble to look across the bay into the neighboring county of Contra Costa. They resemble the annual burnings of the tule on the Sacramento river. Hundreds of thousands of dollars, in what is as good as so much treasure, is thus destroyed every year by the short-sightedness of our California farmers. This is all wrong. There is not a ton of straw grown upon any grain-land in this State, that ought not and might not go back again to the soil. If it is burned up, it is simply destroying the future resources of the land, which every well-meaning person should leave, as far as possible, intact for those who may come after him.

As our California valleys have no river Nile, with its fertilizing waters, to annually restore that which may be taken from it in the shape of fruits and grain, it is enough that we take from the land the bare grain; it is a moral crime to uselessly deprive it of the fertilizing qualities which go to make up the more bulky stalk or straw. In doing that we are robbing posterity without scarcely any present gain for ourselves.

A important lesson may be learned in this direction, from our Eastern grain regions. A few years ago the Genesee Valley, in New York, was the finest grain country, then improved, on the continent. It was managed, at first, very much as land is now managed in California. Its period of successful culture lasted but a single generation; and it is now considered as barely of third rate importance as a grain producing district. The land is worn out. Its wealth of phosphates, of potash, of soda, of lime, etc., is scattered to the four winds of heaven, just where the unthinking farmers of California are sending those same indispensable fertilizing elements from their own broad fields. The most sagacious of our farmers have never practiced it here; many have already abandoned it; let those who hereafter practice it be marked as either incompetent or unworthy the gifts which a bounteous nature has placed within their keeping. If any continue the practice, be their crops ever so abundant now, they or their children, at farthest, will see their lands worn out, and perhaps their children begging bread.

NO EXCUSE ALLOWABLE.

In vain comes up the plea of the want of time or the great cost of labor in California. In vain do they plead the impracticability of such a thing in California. In this dry climate, the plow may indeed turn up the stubble of former years still undecomposed. The more, then, is the necessity for assisting nature in her efforts to restore the fertilizing elements which she is annually yielding up, transformed by the blessed sunlight of heaven and the vivifying rains of our glorious climate into the richest food for the sustenance of man or beast. Her fullest efforts are spent in giving life even to the almost exhaustion of her recuperative powers; let, then, the recipients of her blessings show the trifling acknowledgement of a reasonable effort to aid her in renewing her strength for her annually recurring, life-giving labors. Pile your straw into heaps, tread it down and let it remain on the ground until it does decay, or, what would be better, haul it to your cattle yards, if you have them, where it may be eaten and tramped into the ground, by which it will be readily converted into the best of manure; or what would be still better, cut it up and feed it to your cattle. The worst possible thing you can do with it is to burn it. Those who don't believe our suggestions will pay, will think differently in a few years; when it will be too late to save that which is lost.

If, after all, it is decided that the straw must be burned, let the ashes be immediately thereafter moistened with water and perhaps mixed with a little loam, and spread at once evenly over the land. A gentleman well acquainted with all the best modes of agriculture in Europe, informs us that the only instance in which he is aware that it has been claimed, by experienced farmers, that burning straw is a beneficial mode of getting rid of the incumbrance, and a proper mode of converting it into manure, as in the fens of Lincolnshire, England. These fens are composed almost entirely of turf, with very little earthy matter, and are particularly deficient in silica, a mineral so necessary to the support of the ripened stem. Rotting in the straw-yard does not set free the silica from the straw; and it has frequently occurred that repeated cuttings, without burning the stubble, have so removed the silica from the soil of those reclaimed fens, that the most luxuriant crops of grain have fallen to the ground, as the ripening season approached, merely from the lack of silica to support them. The remedy has been to leave as much stubble as possible, and turn over the field immediately after harvesting. Similar results have been noticed on newly reclaimed bog-land. This reason does not, however, hold good in the grain-lands of California, where silica is usually found to an inconvenient excess.

(To be continued.)

THE ARIZONA MINES.

Mr. C. A. Luke, of the Specie Basis Mining Company, Arizona, has paid us a friendly visit, and furnished some valuable information about the mining resources of Arizona, which he thinks will at no distant day prove fully equal to the most sanguine expectations which have obtained with regard to their value. Much prejudice has heretofore existed about the reputed richness of the mines of Arizona, which, perhaps, nothing but actual results can remove. These results are now fast coming to hand and will soon speak for themselves as facts. It must be borne in mind that the miners in that Territory have toiled and labored under the greatest disadvantages imaginable; and nothing but the proverbial spirit for energy and perseverance, so general among miners everywhere, could have overcome the obstacles antagonistic to success in that distant region. Mills have now been erected in different places throughout the Territory, and the joyful sound of their stamps and the puffing of engines is heard in all parts of the country, to cheer on the weary miner, and offer him consolation through the precious and glittering ore, which they are extracting from innumerable ledges. There have been more developments made among mines in the vicinity of Prescott, the capital of the Territory, than in other parts of the country; but it should be borne in mind that the mines on the Colorado River are not totally neglected; for by every vessel from the mouth of that river we now receive at this port large shipments of copper ore, taken from the mines of Williams' Fork, and other places. Higher up on the river, near Hordyville, several companies are at work in the San Francisco district.

Mr. C. Strong, late Superintendent of the Gould & Curry mine, has erected a 10-stamp mill on the famous Moss lode, which is all complete and now running night and day, with the most flattering results. The poorest rock, which has all along been considered worthless, yields, at the mill, as we learn from private advices, about \$25 per ton. We also learn that the company has just struck, in their tunnel, a 5-foot vein of what appears to be exceedingly rich ore.

There are also organized several companies in the New York and Philadelphia, and in the Sacramento districts, some thirty miles higher up the river, prominent among which is the Specie Basis Mining Company, a wealthy organization of Philadelphia capitalists. The mines in the latter district are supposed to be very rich, the lodes are large and well defined, showing their outlines for miles, and much confidence is felt that it will prove to be the richest district on the borders of the Colorado River. A large portion of the ledge yield argentiferous galena; but there are also in this district some very rich copper veins, prominent among which are the Antietam and Seabeck lodes, belonging to the Specie Basis Mining Company. In climate, this district is not to be excelled. Water and fuel is plenty, and the best kind of feed for animals abounds. The plain or valley near the mines is also valuable for agricultural purposes. The soil is adapted to raising anything needed for the supply of the wants of a large population. Mr. Luke assures us that the Specie Basis company will commence active and full operations next spring, and as the company possesses abundance of capital, they will develop a number of ledges in that district. It will be gratifying for the mining community at large to hear of the progress made in mining operations in this region; and if the Government gives proper protection, through the military, to the industry and capital invested there, Arizona will soon take sides with California and Nevada, the two great gold and silver bearing States in the Union.

The officers of this company are—R. B. Fitts, President; Wm. R. Allen, Secretary.

The arrangements for printing the specifications of United States patents are now complete, and it is expected that the system will soon be in full operation.

MEDICINE CHEST—see advertisement in another column.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, new and important inventions, also, the list of Patent Claims recently issued from the U. S. Patent Office to Inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers in this city of the *MINING AND SCIENTIFIC PRESS*. PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

RUDDER.—Maximilian Wappick, Sacramento, Cal. 1.—I claim providing the rudder blade with slots, forming openings through the entire body of the rudder in such a manner as to allow a partial efflux through said openings and thereby prevent the backing of water, at the same time that the comparative vacuum on the aft side of the rudder blade in steering is being filled with increased rapidity, for the purpose of more evenly balancing the pressure of the water on the forward and aft side of the rudder, so as to reduce the strain on the pintles and facilitate the turning and handling of the rudder in steering a vessel. Second, I claim constructing a rudder of tubes or rounded bars firmly braced and framed, substantially as specified, for the purpose of obtaining, with a small rudder blade, a great effective steering action, and with a reduction of weight of material an increased strength of rudder. Third, I claim, providing the rudder step and shoe, and the pintles and braces, or their equivalents, with concentric grooves and rings, substantially as and for the purpose set forth.

SAFETY VALVE.—William Barnett, San Francisco, California, assignor to J. C. Paige, Stonham, Mass. The inventor claims: First, the arrangement of certain levers and their attachments, substantially as described and for the purpose specified; second, the lever weight so arranged that the lever passes through and works free within the body of the weight; third, the means described for relieving the valve of its load to test its operative conditions; fourth, the arrangement substantially as described for securing the cover of the inclosing case; and fifth, the cap provided to prevent the valve spindle from being wedged, substantially as described.

SOD CUTTER.—Silas A. Moody, assignor to Philip E. Divine, San Francisco, California, claims a series of circular blades or knives upon a shaft or axle arranged to rotate, as described, in combination with a cover, and seat upon the cover, substantially as described.

RECENT INVENTIONS.

A CIGAR HOLDER.—Mr. W. R. Vaader-slice, Jr., 810 Montgomery street, San Francisco, has invented a new cigar holder, which is said to be quite an improvement on those in common use. This holder consists of an amber mouthpiece, to which is attached two silver wires about an inch and a half long, the ends of which clasp a silver ring, through which the cigar in smoking is thrust. Extending out from the amber mouthpiece is a hollow silver point which penetrates the cigar, and dispenses with the necessity of cutting off the twisted end of the same. It is claimed for the invention that the silver tube will catch all the moisture from the cigar, and can always be easily cleaned and kept fresh.

AN IMPROVED CANDLESTICK.—By Judge Rix, of San Francisco. This invention consists of a frame similar to the old one, but the candle is held by two semi-circular blades, set a short distance apart, and brought together to a wedge-shaped wire band. This band is so arranged that it can be moved at pleasure, thereby enlarging or decreasing the socket or candle-rest. By this invention the trouble about large or small candles is obviated; there is no need to whittle off a portion when too large, or wrap the end in paper when too small; the blades can be adjusted to any sized candle. Another item is the fact that there is no loss, the candle burning entirely up, and there being no necessity to dig out the socket, for when it burns out it falls to the bottom of the stick, and there is an end of it.

PATENTS can be obtained for citizens on this Coast through the *MINING AND SCIENTIFIC PRESS* Patent Agency, in one half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars given.

DEWEY & CO., Patent Agents, 505 Clay street, San Francisco.

LINCOLN SCHOOL EXHIBITION.—The Lincoln School has given two exhibitions the past week, for the purpose of establishing a fund to purchase medals to be given at the end of each school year to the best pupils. The entertainments consisted of tableaux, vocal and instrumental music, speaking, etc. The whole has passed off to the general satisfaction of the audiences in attendance. During the programme of the first exhibition, a note was read from Thomas Mooney, Esq., as president of the Builders' Insurance Co., contributing \$25 in aid of the "Medal Fund." We have not learned the amount raised; but trust the boys have secured a good round sum in aid of the praiseworthy object.

WOODWARD'S GARDENS.—We have just had the pleasure of another visit to this place of public resort, and no longer wonder that it stands so high in popular favor, after finding the beautiful walks about the grounds so perfectly hard and dry, compared with the muddy streets we had so recently left. Beauty, neatness and order are displayed in all the departments, and what is still more commendable—and somewhat unusual in places of amusement—no temptation to disorder is offered in the form of intoxicating drinks within these gardens; hence it is fast becoming a favorite resort for families.

It will be seen from the advertisement which appears to day, that new attractions are being constantly added. Already the zoological and ornithological departments are represented by the largest and finest collection of birds and animals to be found anywhere on the coast. Among these we may name the ant-eater, the badger, the California lion, the grizzly bear, and not less than a half dozen other varieties; apes and monkeys too numerous to mention, and not to forget the children who are fond of a ride, we must notice the mammoth double-humped back camel and the diminutive Shetland pony—both well trained and ready for their part of the entertainment.

Not the least attractive feature, however, to be seen here, is the Museum of Natural Curiosities, consisting of coins and implements of all nations, savage and civilized; petrifications, shells, minerals, eggs, stuffed birds, reptiles and minerals of every description, with occasionally a *usus nature*, in the form of a double-headed calf, or a pair of Siamese twins, together with a rare collection of paintings, seldom surpassed in point of beauty and finish in any country.

The entire lower story of the main building is now being fitted up, and stored with a new assortment of similar curiosities, and which we understand will be thrown open to the public about the middle of the present month. This will be a sight worth seeing, saying nothing of the other attractions. Strangers coming to the city will scarcely be able to find a more pleasant or profitable mode of spending a half day or more, than by visiting these grounds.

Air Pump for Sale.—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JOHN ROACH, mathematical instrument maker, 522 Montgomery street. 21v13-3p

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. n010

To Bremen and the German States (marked in Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

To Miners and Families Living in the Country.

DR. BOYNTON'S MEDICINE CHEST, is put up in San Francisco expressly for the use of families, and consists of a chest of moderate dimensions, neat in its appearance, containing those household articles, simple remedies, that families always feel like keeping on hand for immediate and common use, and a book of brief instructions, describing their use.

The object in preparing this Chest was not to make doctors, but for the simple purpose of nursing; hence, a majority of the remedies are such as are familiar to nearly all, who are advanced in life, and the book is simply a representation of those plain truths relating to the department of the nurse already set forth in more extensive works. It was the object, not to say many things, but to say few things—to simplify and make plain for common use. And in selecting the contents of the Chest, the object was not to set forth something new and wonderful, but those of old and acknowledged worth.

In view of the above facts, physicians have everywhere encouraged the circulation of this chest in amiable terms. They recognize the fact that families do not, will not, need not call on them on the occasion of every slight derangement or infirmity. They do not and cannot deny the fact that such obligations of home care rest upon heads of families.

The book gives a description of nearly every medicine in the collection, their use, and their component parts, so that every person may know what he is receiving into his stomach or applying to his person. This openness and frankness is regarded by the best practitioners, and all considerate persons as justice, more than policy. The universal conviction of the more thoughtful is, that that which relates to our health and physical well-being in this life should, above all things, be known, and not kept in the darkness of secrecy.

In introducing this chest in the country, we always first submit it to the criticism of practicing physicians, and feeling the importance and seeing the necessity in this sparsely settled country of home-nursing, and seeing the adaptability of this chest, physicians in San Francisco, Sacramento, Stockton, Knight's Landing, Cacheville, Marysville, Colusa, Oroville, Lincoln, Folsom, and Auburn, have given it their hearty sanction. Seeing the necessity on this coast of people relying upon themselves in such matters, physicians in this State have remarked: "If I could choose but one for a family, I would every time choose this nurse instead of the physician." "If families would get a collection of simple remedies, with plain instructions for their use, they would do away with half the doctoring." "All families should possess themselves of a collection of common remedies, with plain instructions for their use." "I would like to see the chest in every family." "It is a convenience." "It is useful." "Much sickness and much expense might be saved by such home care."

We subjoin the following statistics from Sutter County, California:

"Tao undersigned have had Dr. Boynton's Medicine Chest in their families for the last few months, and willingly state that they regard it as a wise provision, strictly practical and highly useful."

Every person having the chest in the above named county has signed the above article. The publishing of the names being unnecessary, we withhold them and save space.

The undersigned have known Dr. Boynton's Medicine Chest for the last few months, and regard it as a wise provision, and highly useful in every family. The medicines being put up with instructions, its utility, convenience, and great economy are unquestionable.

Signed by Judge BURLEIGH and 45 others.

STATE OF CALIFORNIA, ss.
County of Sutter,
I, C. E. WILCOX, County Clerk in and for said County, hereby certify that I am personally acquainted with a majority of the individuals whose names are subscribed to the foregoing certificates, and that they are good and substantial citizens of said county.
Witness my hand and official seal this 27th day of
[L.S.] December, A. D. 1865.
C. E. WILCOX, County Clerk.

Agents wanted in every County to sell this Family Chest. Their compensation will be a liberal commission on all sales.

The Agent should be a resident of the district which he is to canvass, and accompany his application with good references, and of this city if possible.

We can give further particulars when desired.

All letters should be addressed through the post office, to
E. NORRIS,
12v13-cow61p9 San Francisco.

ALLEN'S LUNG BALSAM!

For the Cure of Consumption and all Diseases of the Lungs.

THIS BALSAM is introduced to the suffering public after its merits for the positive cure of such diseases have been fully tested. The formula from which it is prepared is referred to by the leading medical journals as being equal to any prescription that can be made up, for such diseases, by the medical faculty. The BALSAM is, consequently, recommended by physicians who have become acquainted with its great success. As an expectorant it has no equal! DR. A. L. SGOVILL, who has, for many years, been known to the public throughout the United States as the inventor of remedies for the lungs, recommends ALLEN'S LUNG BALSAM as surpassing anything that has ever been offered to the public for the cure of Lung Diseases. He has used it in his own family with great success in the case of his daughter, who was supposed to be in the last stages of consumption. This lady is now well, and has been permanently cured by Allen's Lung Balsam. 21v13-1m

To Capitalists,

GOLD QUARTZ MINE, SITUATED IN CALAVERAS County, with steam mill fitted up with Amalgamating Pans, etc. FOR SALE. The mine has three main veins, and more than \$50,000 have been spent in opening them and completing the mill. Good wagon roads all the way. Apply to
DELOO FREERES, Bankers,
535 Clay street, San Francisco.
23v13-6m

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rag, Sewing and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. F. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curved Pan, Zonas Wheeler's Improved flat bottom pan, Belden's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Boers' pan, German Barrels, Arastra Gearing, Chile Mills. Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

OIL IN COLUSA COUNTY.—A correspondent of the Marysville Appeal of Dec. 1st, says: All except three companies, have abandoned for the present the search for oil. Of these, three, one, superintended by Col. Whiting, and located at Bott's, Antelope Valley, as I was informed, have gone down some 700 or 800 feet, with increasing prospects of success.

Another well, under the superintendence of Mr. Hughes, has penetrated earth and rock some three or four hundred feet in a little western branch of Antelope Valley, on the premises of the late John Lane. The prospects at this location are also very cheering.

Next we notice the well of "Louie" Lewis and Marcuse, located at or near where the waters of the Antelope make their exit from the mountains into the valley below. Louie is three hundred feet down, and the gas is now forcing the water up within touching distance of the top of the well.

These three enterprising companies have each steam engines running night and day, and great hopes are entertained of their early success.

LIGHT VS. HEAVY STAMPS.—We condense the following from the Colorado Journal: "We could wish that some of the money, time, ingenuity, etc., that have been expended here during the last two or three years in making and setting to work outlandish and impracticable machinery and processes, had been expended on the improvement of the stamp mill. That grand old stand-by of all gold quartz countries has actually, we believe, been growing clumsier, less effective, and more costly all the time. Mr. Belden is employing four different stamp mills. Of these, the old Empire mill, which is like our first crop of stamp mills—having narrow and close batteries and 450 lb. stamps dropping thirty times a minute—is doing by far the best. Mr. Bertola says that thirty years experience in quartz milling has taught him that Colorado has made the biggest mistake in the world in investing so largely in heavy, slow-moving stamps. He says, never make a stamp weighing more than 350 lbs."

The young Prince Imperial of France is learning the trade of the printer, under the charge of an adept. He will always have a means of livelihood, whatever may turn up.

CALIFORNIA BRASS FOUNDRY.

418 Montgomery street, San Francisco.

Administrators' Sale of Real Estate.

NOTICE IS HEREBY GIVEN, THAT IN PURSUANCE
of an order of the Probate Court of the City and
County of San Francisco, in the State of California, made
on the fifth day of November, A. D. 1886, in the matter of
the estate of ELIZA ANN DOUGLAS, deceased, the under-
signed, the Administrator of said estate, will sell at public
auction, to the highest bidder, for cash, in one parcel, and
subject to confirmation by said Probate Court, on MON-
DAY, the third day of December, A. D. 1886, at 12 o'clock,
M., at the auction rooms of Olney & Co., No. 418 Montgomery
street, in the City and County of San Francisco, all the
right, title, interest and estate, of the said intestate at the
time of her death, to wit: the right, title, interest and estate
of the said intestate in and to that certain lot, piece, or
parcel of land, situate, lying, and being in the said City and
County of San Francisco, State of California, and bounded
and described as follows, to wit:
Commencing at a point in the southerly line of Broad-
way street, distant one hundred and fourteen feet six
inches easterly from the southeasterly corner of Broadway
and Powell streets; thence southerly at right angles to the
Broadway street, with Powell street one hundred and
seventy feet six inches; thence at right angles westerly nine-
teen feet six inches; thence at right angles southerly and
parallel with Powell street nineteen feet four inches;
thence at right angles easterly three feet six inches; thence
at right angles southerly and parallel with Powell street
forty feet eight inches; thence at right angles easterly
thirty-nine feet six inches; thence at right angles northerly
and parallel with Powell street one hundred and
thirty-seven feet six inches to the southerly line of Broad-
way street; thence westerly along the said line of Broad-
way street twenty-three feet six inches to the point of
beginning.
Terms and conditions of sale: Cash—ten per cent. of the
purchase money to be paid to the auctioneer on the day of
sale; balance on confirmation of sale by said Probate
Court; deed at expense of purchaser.
SAML S. MURFEY,
Administrator of the Estate of Eliza Ann Douglas, deceased.
San Francisco, November 10th, 1886. 19v13

And in accordance with law, and an order of the Board of Trustees, made on the twentieth day of September, 1886, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the auction rooms of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on the twenty-seventh day of November, 1886, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

G. O'HARA TAAFFE, Secretary.

Office, No. 430 California street, San Francisco, Cal. no3

POSTPONEMENT.—The above sale is hereby postponed until Tuesday, the eighteenth day of December, 1886, at the same time and place. By order of the Board of Trustees.

O. O'HARA TAAFFE, Secretary.

Hope Grovel Mining Company. Location: Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of November, 1886, an assessment (No. 11) of one dollar per share was levied upon the capital stock of said Company, payable on the seventeenth day of November, 1886, in gold coin of the United States, to the Secretary, at the office of the Company, No. 523 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the twenty-ninth day of December, 1886, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the thirty-first day of January, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 523 Clay street, San Francisco, Cal. n24 5w

Keynote Mining Company. Location: Works: Copperopolis, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of November, 1886, an assessment of ten dollars (\$10) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 440 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Monday, the twenty-first day of January, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-first day of February, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. P. SUTTON, Secretary.

Office, 440 California street, San Francisco, Cal. no21

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Framc; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burned. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 210 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in minor inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to KNAPP & GRANT, San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Truck Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Truck Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Truck Jacks of the most superior make and kind. For sale by 12v12-3m KNAPP & GRANT, San Francisco.

HUNTER'S IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

ANDREW HUNTER, Inventor, San Francisco.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY, San Francisco.

1v1

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the Mining and Scientific Press, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants in a careful, prompt and efficient manner.

SAN FRANCISCO, June, 1866. DEWEY & CO., Patent Solicitors.

Brevities.

BLACK TEA, of fine quality, is now raised in Georgia.

FORTY-TWO millions of gallons of distilled spirits are annually consumed in this country.

B. N. BUGBER, of the Nafoma vineyard, near Folsom, has made nineteen tons of raisins this season.

THE Russian Government has given orders to the Colt's Fire-arms Company of Hartford, Conn., for 100,000 Laidley breech-loaders.

Two scientific gentlemen, from the Royal Swedish Institution, are now, at the instance of their Government, inspecting the iron works of the United States.

A SECTION of a red-wood tree from California, intended for the Paris Exposition, has reached the Department of the Interior. It is eight feet in diameter, and two and a half inches thick.

TWO hundred and twenty-five tons of linseed from Calcutta arrived in this city a short time since. The operations of the Pacific Oil and Lead Works will commence about the first of January.

CARBOLIC ACID, as a disinfectant, is unrivaled. Several experiments have recently shown that the virus of rinderpest mixed with a trace of this acid, becomes incapable of transmitting the disease.

At a meeting of the committee which is to represent the California Chamber of Commerce in the Paris Exposition, Prof. W. P. Blake exhibited the largest collection of gold crystals in the world. He has been occupied for fourteen years in making it.

In order to test the comparative merits of the English and American ordnance, the English Government has ordered from the United States, one of the 15-inch Rodman guns, together with improved carriage, shot and powder.

At Shoburness, Eng., a short time since, a Palliser bolt of chilled iron, weighing 254 pounds, was fired with a charge of forty-three pounds of powder, from a 9-inch Woolwich rifled gun. The bolt penetrated a target made of solid rolled iron eight inches thick, backed by eighteen inches of teak wood.

The Ancient River System.

A writer in the MINING AND SCIENTIFIC PRESS, from Sierra county, has contributed a number of articles on mining subjects, which we have read with interest and profit, as they are evidently the production of a careful observer and show some scientific attainments. Sometimes we have had to dissent from his conclusions, and this has especially been the case in some of his papers relating to the ancient river channels of the Sierra Nevada mountains, or what is known by the miners as the "Blue Lead." The writer is of the opinion that there was but one large stream in which the blue gravel has been deposited, and he goes so far as to attempt to describe its course, together with its branches, and reconstruct the ancient river system. In his opinion, the ancient river took its rise in Plumas county; flowed in a southerly direction through Sierra, Nevada, Placer, El Dorado and Calaveras counties, and discharged its waters into the ocean, which at that time covered what is now San Joaquin county.

The writer's theory is the same as has generally obtained recognition among miners for many years; but developments have constantly been making in Nevada county inconsistent with the theory of one main ancient river, until now this theory is generally discarded. The better opinion now is, that the ancient streams which deposited the blue gravel were as numerous as the streams of the present day; that they carried as much water, perhaps more, and their general course was about the same. There are evidences of four such streams in Nevada county, having their source near the summit, and running south or west through the entire length of the county. If a large stream ever crossed the county from north to south, it must have belonged to a different river system from the blue gravel leads that have been opened and worked. The stream on the south side of this county had its source near Meadow Lake, and its course has been traced by surface indications to Yon Bet. Operations are now in progress at Bear Valley and Chalk Bluff to find its channel. The two middle streams probably joined their waters at no great distance below Nevada, and bad their outflow near Smartsville. The other stream had its source near the head-waters of the Middle Yuba, and its course was down what is now the Eureka ridge. The field for mining operations in the channels of these streams is of incalculable extent. The time will come when the ancient river system of the State will be reconstructed; and the subject might well engage the attention of geologists and scientific men.—Nevada Gazette.

RESE RIVER RESOURCES.—We extract the following from the report of the Assessor of Lander county, Nevada. The date is Austin, November, 1866:

The principal production of silver has been from the more developed mines in and around the city of Austin. Lately many new, large and rich veins have been discovered and prospected in the eastern and southeastern part of the State, which show evidences of great and lasting wealth.

The distance of Central and Eastern Nevada from the coast, the newness and undeveloped condition of the country, and consequent high price of labor and supplies, and want of capital, has operated adversely to the interests of the miners and caused many failures. As the country becomes more opened and cultivated, labor and materials lower in price, many mines which are now unproductive will be opened and made profitable, and occupation and means of good support thereby afforded for a large population.

There are erected and in process of construction thirty-four steam hoisting works, varying in motive power from six to thirty-horse power, and at an average cost of about \$6,000 each. There are many other mines worked by horse whips and by hand.

There are twenty-four mills for the reduction of silver ore, of which twenty-two are run by steam and two by water power. They vary from five to twenty stamps each. The whole number of stamps is about 250. Dry crushing and roasting is the general practice in the reduction of ores. About three-fourths of a ton of ore is crushed per stamp in twenty-four hours.

It has been found necessary to roast all the ores to obtain a profitable return, which makes the cost of reduction much more than in the western part of the State. The present cost of reduction at custom mills is \$45 to \$50 per ton.

For the nine months ending 30th of September, 1866, there were reduced in this county, as per mining assessment roll, 4,364 tons of ore, which produced the sum of \$507,301—averaging \$116.25 per ton.

The deepest mining shaft, which is in the city of Austin, is upwards of 400 feet in depth. There are several other shafts and inclines which reach 300 feet and upwards.

The best and most productive mines are those upon which deep inclines and shafts have been sunk. These are the Savage, Great Eastern, Diana, Yankee Blade, Whitlatch Yankee Blade, Whitlatch Union, Camargo, North River, Timoke, Cortez and some others. Most of them produce ores which average in value \$150 and upwards.

Machinery.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the inventors are enabled to offer these machines to the public at the following low terms:
No. 1—Or 6 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600
No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour. \$850
No. 3—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour. \$1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass over it. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa County, Rawhide Ranch, Tuolumne County, Excelsior Mine, Lake District, Nevada County, and can be seen in operation at the Fulton Foundry, First street, San Francisco.
The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:
Rawhide Ranch, Tuolumne Co., Sept. 28, 1866.
JAMES BRODIE, Esq., San Francisco: My Dear Sir: I give you pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
R. P. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1861. Further particulars will be afforded on application to the subscribers.
Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1866, the royal charter using the same will be raised to the sum of \$100 per Barrel.
A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.
A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22nd, 1866.

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.
8v13-ly Stove Store, No. 125 Clay street, below Davis.

Such a Journal has been needed on the Pacific Coast. The Press fills the bill.—[Rose River Reveller.

THIS CUT REPRESENTS AN AMALGAMATOR and Separator that has stood the test of thirty years' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the latter Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "floor" the mercury, and collect any that may have been "sicked out" in the battery or grinders.

3d. The "shaking" motion given to the pulp (by the revolution of the miller under the stationary frame) against the amalgamator-copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The pulp in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge. If our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

THE SUTRO TUNNEL.—We have received a copy of a beautifully printed pamphlet, the object of which is to lay before the public the present position of affairs regarding the contemplated "Sutro Tunnel," and to present its claims to consideration by capitalists as a desirable investment.

Mr. Sutro has just returned from New York, which he visited for the purpose of laying the matter before the capitalists of that city, intending, if necessary, to visit Europe also. But after a careful examination of the project, some forty or fifty prominent gentlemen gave it as their opinion in writing, in the form of a letter to Mr. Sutro, that although they were fully convinced of the importance of the enterprise, the fact that no portion of the capital had been subscribed on this coast, would be a fatal impediment to its success, both in the Atlantic States and in Europe; and advised him to return at once to San Francisco, and use every effort there to get the work started, adding, that when the tunnel was fairly in progress, he might rely upon their aid. He therefore returned, and now issues the above-mentioned pamphlet.

The estimated annual revenue of the Tunnel Company from contracts with the mining companies on the Comstock lode alone, will be about *six and a half millions* of dollars. When we take into account, in addition to this, the amount to be realized from the sale of land, and the prospective value of the new mines which the tunnel will develop, we can form some conception of the magnitude of the franchise.

We cannot but look upon this enterprise as a most important one. Although the immediate interests of a portion of the people of Virginia City and Gold Hill may apparently suffer, the work would unquestionably redound to their benefit in the end. The energetic perseverance which Mr. Sutro has evinced in the prosecution of the project, deserves success.

AN AMERICAN FAMILY IN GERMANY, is the title of an interesting book of travels, by Mr. J. Ross Browne, just issued from the Harpers press, a copy of which has been received from the author. In addition to the matter indicated by the title, the book also contains "A Whirl through Algeria," and "A Visit to the Salt Mines of Wieliczka" in Poland. The reputation which Mr. Browne has obtained as a traveler, and the novel and interesting manner in which he always contrives to clothe his descriptions of well known localities, always give his works the freshness and interest which are usually found only in the sketches of those who push their way into unknown or unfrequented countries. Mr. Browne is a most indefatigable traveler, and his habits of close observation, and happy mode of expressing them, always invest his productions with novelty and interest. We shall endeavor to find room for some extracts in a future number.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. Smith, M. D., Consulting Physician; R. S. Macbeth, M. D., Attending Physician; W. G. W. Harford, Manager; H. Andrews, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. MOYNIHAN & AITKEN.

Excelsior Double-Acting Suction and Force Pump.

The Best for Mining, Farming and Domestic Use.

THE EXCELSIOR PUMP is a California invention of intrinsic merit, and as such is being rapidly introduced, and giving perfect satisfaction. At the Mechanics' Institute Fair (1865), it was awarded, for its superiority, a

Premium Medal.

It is manufactured by California Mechanics, in the most perfect and durable manner.

It is remarkably simple in construction, and its valve chest is almost instantly accessible without disconnecting the air-chamber, suction or discharge-pipes. It can be worked at any speed.

Figure 1 is a sectional view of a 6-inch Mining Pump, showing the plunger and hemph-packing, and the valve-chest containing the puppet valves. Fig. 2 illustrates the water-passages and valve seats in the chest.

The following sizes are constantly manufactured of this

SUPERIOR DEEP-WELL PUMP.

- No. 1.—Cylinder 2½ inches; stroke, 6 inches; capacity 750 gallons per hour; weight, 60 pounds.
- No. 2.—Cylinder, 3 inches; stroke, 7 inches; capacity 1,280 gallons per hour; weight, 80 pounds.
- No. 3.—Cylinder, 4 inches; stroke, 9 and 8 inches; capacity, 2,500 gallons per hour; weight, 200 pounds, with iron frame and slide complete.
- No. 4.—Cylinder 5 inches; stroke, 15 inches; capacity 5,420 gallons per hour; weight 500 pounds.
- No. 5.—Cylinder, 6 inches; stroke, 24 inches; capacity 12,575 gallons per hour; weight, 1,000 pounds.

The Nos. 3, 4 and 5, are made to endure the

severe test of use in mines, and are constantly superseding those of other manufacturers. The pistons being packed with hemp, are proved to be far more durable and less expensive than leather.

We manufacture to order 8 and 10-inch Pumps. Also, sold at cheap rates, 5 and 6-inch Brass Pumps for ships.

THE PIONEER TYPE FOUNDRY.

We were the first to announce, some weeks since, the fact that the Messrs. William and George L. Faulkner, father and son, had made arrangements to establish a type foundry in this city, at their well known place of business, 411 Clay street, on a scale which should be fully commensurate with the growing wants of the entire Pacific coast. That important enterprise was fully inaugurated on Tuesday last, on which occasion a large number of gentlemen, practically engaged in the printing business, assembled by invitation of the Messrs. Faulkners, to witness the interesting operation of type founding.

Some idea of the enterprise connected with the undertaking, may be formed from the fact that, including this, there are only thirteen type foundries in the United States, located as follows: New York city, 6; Boston, 2; Philadelphia, 1; Cincinnati, 1; St. Louis, 1; Chicago, 1; and San Francisco, 1. It is further estimated that fully \$2,000,000 have already gone from this to Eastern cities for the purchase of type, creating a specie drain which has now reached a considerable magnitude, and which the establishment of this foundry will be likely to pretty effectually close up; as we understand that the Messrs. Faulkner propose to furnish type here at prices which shall prevent importation, so far as the same may conflict with their manufacture. Having secured the most improved machinery, and skill fully equal to that employed in any of the Eastern foundries, they are prepared to furnish as good a quality of type as can be elsewhere obtained. By this arrangement, parties will also be able to get the fullest value for their old type, immense quantities of which are constantly accumulating on this coast.

IN THE MANUFACTURE OF TYPE,

The various operations, from first to last, are of the most delicate and intricate nature. Even the mixing of the metal, or producing the alloy known as "type metal," is a most difficult process, the slightest variations causing important modifications, which, more or less favorably or unfavorably affect the character and durability of the type. Each foundry, generally, has a particular mixture of its own, the proportions of which are kept a secret. The mold is a most complex instrument, and finished in the most delicate and accurate manner, the use of which is to form the "body" of the type. The matrix is formed of a small copper bar, one and a half inches long, by one-third square, having the letter sunk upon one of its sides, near the end, by a punch. The most difficult part of the entire work is the cutting of this punch, which makes the letter or character on the soft material of the matrix. It is said that there are but four really expert punch makers in the entire Union. There are probably but few, even among practical printers, who are aware that it requires not less than 367 separate matrices, with an equal number of punches, to produce a full set of types of any one kind used in a book or newspaper. One mold, however, answers for a full set of matrices. The letters, after being cast, go through five different sets of hands, in the various finishing processes. After coming from the mold they go first to

the "breakers," who remove, by breaking it off, the little stem or "jet" attached; they then pass through hands which remove any little inequalities on the two flat sides, which is done by rubbing upon a stone; from thence they go to another table, where they are set upon long "sticks," preparatory to the final finishing operations by the "finisher;" thence to the boys who break them up into short lines, to place them in pages, in which form they are done up in wrappers for the market. In this connection it may not be uninteresting to our readers to peruse a short

HISTORY OF MACHINE TYPE-CASTING.

It was not until about the year 1820 that any special effort was made to produce a machine which should facilitate the casting of type. In the year 1825, Mr. Elihu White, a type-founder of New York, succeeded in producing the first machinery, which even then indifferently accomplished the work. This machinery, however, does not seem to have been very successful, for we do not hear that it was employed by any other party than Mr. White, and to but a limited extent even by him. About the year 1838, a nephew of Mr. Bruce, the celebrated New York type-founder, recently deceased, succeeded in producing a type-casting machine, which effectually overcame the hitherto insurmountable difficulty previously encountered in casting type by machinery. This difficulty arose from the impossibility of expelling the air from the mold when the metal enters it, which is effectually done in hand-casting by the operator giving the mold a sudden and adroit jerk upward, with the left hand, the instant it has been filled with molten metal by the right hand. When the air is not perfectly expelled from the mold, it passes into the body of the type, forming little cavities, which make the type weak, and liable to sink under the force of the impression. The quick eye of Mr. Bruce at once comprehended the value of this improvement, and he purchased the patent in 1840, and immediately introduced the machines, with some modifications, into his foundry.

The success of Mr. Bruce soon secured the general introduction of the machine into other foundries, both in this country and Europe; and the casting of type by machinery has now become almost universal. Thus America has given to the world the only effective machinery for casting type, as well as the most efficient printing press. Both machines originated in the city of New York.

The type-casting machines in use at the Messrs. Faulkner's foundry, are substantially the same as those first introduced by Mr. Bruce. The patent right for the same is now vested in James Conner & Sons, type founders of New York.

DESCRIPTION OF THE MACHINE.

The front part of the machine consists of an ingeniously modified hand-mold. The rear comprises a small furnace, over which is placed a pot of molten metal. The whole is so arranged, that when motion is given to the machine, by turning a crank and fly-wheel at its side, the mold is made to approach a small nipple attached to the melting pot. When contact is effected, a cam motion opens a valve, so as to form a connection between the molten metal and the interior of the mold; at the same instant a plunger is driven downward, so as to force the metal into the mold, under great pressure, by which all the air is expelled therefrom, and the metal forced into the matrix so

as to form a perfect cast of great sharpness and accuracy, which "sets" almost instantaneously. The metal is now shut off, and the mold disconnected from the nipple, and so opened by ingeniously contrived devices as to allow the type to drop out by means of its gravity, and fall through a spout into a receptacle placed to receive it. The movements are exceedingly simple, and are all effected by merely turning a crank. Each turn of the crank produces a type, and the speed of the machine is limited only by the time required for the cooling of the metal. This is at the rate of six types per minute for the largest size job type cast by machinery, down to 150 per minute for the smallest news or book type. By the use of one of these machines, one man will do as much work in casting small type as six by the hand machines. The old hand-mold is now seldom used, except for casting large sized job type. The largest machine cast type is 7-line pica. In some of the most extensive Eastern foundries these machines are run by steam-power.

It may be proper in this connection to state that the machinery, molds, matrices, etc., for this establishment, have all been prepared at the foundry of Conner & Sons, New York, and under the immediate supervision of Mr. Andrew Foreman, who came out with them, and who will continue to act as foreman for Messrs. Faulkner & Son. Mr. Foreman is one of the most skilled mechanics in his line in the country, having learned his business in Scotland, and having acted for several years previous to his engagement with the Messrs. Faulkner, as head machinist at Bruce's foundry, New York.

THE FIRST FONT OF TYPE

To be issued from this Pioneer Foundry on the Pacific Coast, has been engaged for the MINING AND SCIENTIFIC PRESS, in which this paper will appear on the first of January next.

STEREOTYPING AND ELECTROTYPING.

In order to render their establishment complete, the Messrs. Faulkner have connected with their type foundry business the necessary machinery and appliances for stereotyping and electrotyping, and for making brass rule for printers' use. Workmen are now engaged in putting this machinery in order, which we shall describe, at length, after having seen it fully in operation.

PERSONAL.

In closing this notice, we cannot refrain from a short personal reference to the past history of the connection of these gentlemen with the printing and publishing interest of the Pacific coast. The Messrs. Faulkner arrived in California with the first tide of emigration in 1849, and brought with them a complete new and job printing office, with which they started the weekly *Pacific News*. This paper was continued some two years, paying large dividends to its proprietors; but finally encumbered and ceased to exist, only after it had been thrice burned out, in the terrible conflagrations which visited this city in the summers of 1850-51. In the meantime, however, Mr. Faulkner the elder, had returned to the East, where, from sickness and other causes he remained several years; but finally returned again in 1858, and established himself with his son as agent for the sale of Conner & Sons type and printing material. They have continued successfully in this branch of business, enlarging their facilities with the growing wants of this community, until they have finally accomplished their long cherished desire of establishing the Pioneer Type Foundry on the Pacific coast. They will hereafter manufacture at their foundry all the more ordinary kinds of type in use, relying upon their Eastern correspondents for only such things as enter but sparsely into printers' use. A business acquaintance with these gentlemen of some ten years standing, enables us to speak from experience, when we assure our friends of the fraternity that no more prompt or accommodating firm can be found in this city, in their line of business.

Communications.

In this DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Letter from Doctor Jackson—The Colorado Meteor.

EDITORS PRESS:—I observe in the last number of your paper, that you have published a notice of the Colorado meteoric iron, discovered on Bear River, Colorado, by Messrs. Wilson and Morrison.

This meteorite has recently been analyzed by me, and you may perhaps feel interested in the results, which I now communicate for your paper. The piece sent me weighed four ounces. It had on one side a crust of sulphide of iron resulting from the heating of the iron in a forge in order to cut off the piece sent me, the bisulphide having lost one equivalent of sulphur by heat. This crust was from 1-10th to 1/16th of an inch in thickness. The metallic mass of the specimen was smooth and polished, then acted upon by dilute nitric acid, shows very strongly the Widmannstättian figures, in small (nearly equilateral) triangles, with the lines well raised and sharply defined. The specific gravity of the metal taken on a clear cut and polished piece was 7.692. On chemical analysis, the following ingredients were separated:

Metallic Iron.....	90.850 per cent.
Metallic Nickel.....	7.867 "
Metallic Cobalt.....	0.010 "
Metallic Tin.....	0.020 "
Insoluble Matter, consisting of Schreibersite, a compound of phosphorus iron nickel and a trace of chrome.....	0.950 "
Total.....	99.497 per cent.

From this analysis it will be seen that this iron is truly meteoric. I learn that Prof. C. U. Shepard, of Amherst College, has purchased the large mass, which is said to be nearly two feet in diameter.

I am much interested in the study of meteorites, and will gladly analyze any specimens that may be sent to me from the Pacific coast.

We are now expecting the great meteoric shower which has been predicted by Professor Newton of Yale College. If the shower equals that which took place in 1833, it will be well worth the trouble of spending part of the night in the open air to see it. The city of Boston has ordered the fire alarm and the watchmen's rattles to signalize the event, the moment the grand celestial fire-works begin to be played off.

Since Prof. Newton cannot "postpone" the exhibition "on account of the weather," we earnestly hope the "unmannerly clouds" will keep out of the way, and give those of us who may not be here thirty-three years hence to see the next predicted shower, a chance to see it now.

With many thanks for your valuable paper,
Respectfully yours,
CHAS. T. JACKSON.

P. S.—The above analysis has been read at the Boston Society of Natural History, at the last Wednesday's meeting, November 7th, and a copy has been sent to the *American Journal of Science*, and will probably appear in the January number of that journal. C. T. J.

PRESERVATION OF LEMONS.—Lemons may be preserved by the very simple process of varnishing them with a solution of shellac dissolved in spirit of wine. Fresh lemon juice is thus attainable at all seasons of the year; and, if the peel be required for flavoring, the skin of shellac may be easily removed by simply kneading the elastic lemon in the hands.—*Pharmaceutical Journal*.

Lemons thus prepared cannot be relied on for keeping. The shellac is too brittle a substance for such a purpose. It is too liable to crack, and thus form orifices through which the oxygen may reach the lemon and cause its speedy decay. If the lemon is dipped into melted paraffine, and thus thoroughly coated, by one or two immersions as a candle is dipped, it may be preserved for a considerable length of time. Fresh meat may thus be preserved; and when wanted for use, the paraffine may be removed by dipping the substance so preserved in warm water.

THE WOONSOIE MINE, near Georgetown, the marvel of the day, has just ordered a second one of Cushing & Co's 6-inch Excelsior mining pumps, with all the necessary appliances.

[Written for the Mining and Scientific Press.]

Sodium Amalgam—Letter from Mr. Wurtz.

EDITORS PRESS:—I note in your issue of October 16th, some exceptions taken by Mr. G. Kustel to portions of my communication to the American Association at Buffalo. On referring back to your previous numbers, I find that the substantial part of my Buffalo paper was not before Mr. K.; the article copied by you, consisting of but a few of the concluding paragraphs, the "tag end" (so to speak) of my paper—all the substantial part having been most perversely and unaccountably omitted by the *New York Tribune*, the journal whence you took it. I am therefore constrained, by the attitude under which the matter presents itself to your readers, since Mr. Kustel's last letter, to ask of you the great favor of space, not only for a few words in rejoinder to Mr. Kustel, but also for a more complete abstract of the Buffalo paper itself, which I therefore forward in the form in which it has appeared in some of our cis-continental journals. I enclose, also, a copy of a letter from the chemist of the Gould & Curry company, which recounts some of their earlier results of working tests. I may add that many results have been obtained, which we are not yet at liberty to give to the public; others are not yet sufficiently matured, and there are still others of which we have as yet only general, though mostly highly satisfactory reports, and await the details before publishing.

To return to Mr. Kustel, however; it appears that although he has before admitted, and now again repents, that the use of sodium amalgam is beneficial in gold amalgamation (which can only be understood as a concession of all I claim—namely, that sodium exalts the adhesion between quicksilver and the precious metals, and prevents the flouing of amalgams of the latter), he still strangely insists that it can act only by decomposing silver ores chemically, according to its long known and familiar power of removing most of the metalloids from their argentic compounds. I must reiterate, what I supposed I had clearly enough expressed in my specifications published months since, that I do not contemplate interfering with the reducing agents (iron, etc.) now in use; but that my discovery consists in greatly accelerating and intensifying their action by adding a minute quantity of sodium.

I recommend to Mr. K., and to other practical metallurgists (all, of course, familiar with the tardy and tedious action of iron on moist chloride of silver), to bray together, in a mortar, some iron filings, quicksilver and precipitated chloride of silver, adding, meanwhile, a small quantity of sodium amalgam; the sodium in which, however, may be but a small fraction of that equivalent to the chloride. *The almost instantaneous result will be a mass of pasty or nearly solid silver amalgam.* If such phenomena as this are to be ignored, or pooh-poohed, as signifying nothing, and having no bearing on the working of silver ores, I have but to submit respectfully that this seems like carrying an assumption of practicality (?) and an affectation of contempt for science considerably beyond the limits of common sense.

The above experiment will serve, for the present, to exemplify and illustrate the mode in which the exalted adhesion and more intimate contact produced by sodium enhances and quickens voltaic and chemical reactions between metallic substances. This is the first and greatest of the discoveries upon which my new methods are based; and the second depends simply upon the correlated principle that metallic cohesion as well as adhesion—that is, attraction between the homogeneous as well as heterogeneous surfaces—is, at the same time, exalted by sodium; whence it arises that floured and pasty precious amalgams, which incorporate together with difficulty, and usually only on application of mechanical force, coalesce spontaneously and with avidity when quicksilver, containing a minute quantity of sodium, (or, as I have been somewhat ridiculed by Mr. K. for expressing it in the "magnetic" condition,) has been added thereto. It is on this ground that I have recommended the use of sodium in separating and collecting diffused silver amalgam from a slime or pulp.

Mr. Kustel's brief comment on this, that "this may be so," seems hard to reconcile with

his belief expressed in another paragraph, that sodium must "cause a greater loss of quicksilver by rendering the latter liable to be ground to flour." I fully agree with him that "silver amalgam is not silver ore," though unable to see clearly the bearing of the observation.

Mr. Kustel also still adheres to his preconceived idea that iron pans will have to be eschewed in all operations with sodium amalgam; his reason, as I understand it, being the "local" voltaic action which may set in, upon mutual contact of iron, sodium amalgam and water, which, theoretically, should soon remove all the sodium. I have, nevertheless, before pointed out, as the result of my own experiments, that when iron becomes enfilmed by the amalgam, this "local action," as in the case of the zinc of an ordinary voltaic couple, is greatly retarded. With some kinds of iron it becomes almost nil. I wish now, however, to show conclusively that this objection is a "bngbear." A moment's thought will show any one skilled in the art that the mullers of the pan should keep the quicksilver so diffused in globules throughout the slime that no contact of consequence with the iron can occur. When such diffusion does not take place, it merely argues imperfect manipulation. The most that can be made of this objection of Mr. K's, is the suggestion that the mullers be of stone, or some material other than iron. My results, though, are to the effect that the amount of sodium necessary to produce a very marked benefit, falls much below that which is requisite to engender the voltaic action upon surfaces of cast iron, which Mr. K. deems so very objectionable.

I have to complain of Mr. Kustel's apparent insinuation, that I have fallen into a common method of "putting the cart before the horse," by trying to force the results of experiment into accordance with a preconceived "idea." I claim that the ideas I have promulgated are solidly founded upon experiments, and still maintain that Mr. K's assumptions, that sodium may only be used on silver ores as a decomposing agent, and that, therefore, it is necessary also to go to the extreme of decomposing the ores of the baser metals—thus contaminating and flouing the quicksilver—and his other assumption, that the iron walls of a pan necessarily neutralize and destroy the efficiency of sodium under all circumstances, and his experiments based thereon, as reported, have no real applicability to the case, as I said in my Buffalo paper. I believe that apart from the "self-confidence" of which Mr. K. (if I apprehend him aright), accuse me, I can appeal to the facts I have set before your readers to sustain these claims. I also claim that Mr. Kustel's opinion, that sodium is "too expensive" to be applicable as I propose, is untenable in the extreme. As a *reductio ad absurdum*, let us suppose that it were necessary, as he believes, in the translation to amalgam of the silver in an ore (the chloride, for instance), to use an equivalent quantity of sodium—then, as one pound avoirdupois of sodium is equivalent to 4.7 pounds of silver, or about seventy-five ounces, worth \$1.29 per ounce, \$96.75, it is necessary to show cause why the cost of sodium must approach this latter sum (in coin) per pound to prove its use, even for "decomposing" chloride of silver, unprofitable, and to give any currency to this "idea" of Mr. K.

I fear it may be necessary for me to add here, distinctly, that these calculations are intended only as illustrative, else I might be accused of justifying the direct use of sodium as a reducing agent in silver metallurgy, the time for which has not yet come. I am, Mr. Editor, very respectfully your most obedient,
HENRY WURTZ.

New York, 57 Broadway, Nov. 1, '66.

REMARKS.—By careful reference to the files of this paper, our correspondent must observe that we have published everything of material interest with regard to sodium amalgam, which has appeared in either the English or American papers, besides much that has been written upon that subject, especially for the MINING AND SCIENTIFIC PRESS; a considerable portion of which last Mr. Wurtz appears to have thought of sufficient importance to incorporate, with due credit, in his paper on "The Utilization of Sodium, in Gold and Silver Amalgamation," which he read before the "American Association for the advancement of Science," at their late meeting in Buffalo. Our report of the proceedings of that association, was collected from the columns of the *Buffalo Express*, and not from the *New York Tribune*, as supposed by Mr. W.; although the former named sheet, like the latter, most unaccountably omitted that which was perhaps the most essential part of the entire paper, or rather dismissed it with a brief reference, which, such as it was, we gave in full. The omission referred to was that portion of his remarks wherein he replied to the objections urged by

Mr. G. Kustel, of this city, through the columns of the MINING AND SCIENTIFIC PRESS, against the use of sodium for amalgamating purposes under certain conditions. We now publish the remarks of Mr. Wurtz on that point, in full, as furnished by himself. After making some lengthy allusions to the favorable notices which had been made by various journals and persons, Mr. Wurtz said:

American metallurgists, however, are not altogether unanimous in admitting all the advantages I claim for sodium. Kustel, known as the author of a work on gold and silver metallurgy, seems bitterly opposed to its use upon silver ores. In his experiments, however, Kustel has fallen into the error that the use of sodium, to quote from him, "in the decomposition of silver ores" is based upon "its ardent desire for combination with oxygen, sulphur, etc." It was never proposed by me to use sodium for the decomposition of silver or any other ores. The addition of sodium to the quicksilver used in amalgamating silver ores, in sufficient proportion to enhance the adhesion of the quicksilver to the metallic silver which has already been separated from the sulphides, etc., by other agencies, will be found highly beneficial; as well as the addition of magnetic quicksilver to a pulp or slime which contains a floured or pasty silver-amalgam diffused throughout its mass, for the purpose of collecting and incorporating the silver amalgam into one mass.

Should enough sodium be present to produce the decomposing effect on the silver sulphides by sheer force of chemical affinity, which Kustel regards as the object of the invention, the real object would inevitably be defeated, as the quicksilver would then become loaded with the baser metals and other impurities, which would destroy its amalgamating power altogether. This is evidently what has actually taken place in some experiments on silver ores which Kustel reports in the *San Francisco Mining Press* of March 31, 1866, in which he obtained with sodium but one-third as much silver with a given ore as without it.

Kustel's results, therefore, having been founded upon an incorrect idea of the mode of employment of the sodium, have no applicability either *pro* or *con*. Kustel's statement that contact with iron "highly increases the rapidity of the decomposition of water by sodium amalgam" is at variance with my own observations, which have generally tended to precisely the opposite conclusion; and his inference therefrom, that iron pans therefore cannot be used with sodium, is shown to be fallacious by numerous practical results on record.

Another fanciful objection of Kustel is "amalgamation with the iron of the stamps or shoes." I have shown that no "amalgamation" of iron takes place, but a merely transient enfilming, which is extremely beneficial instead of prejudicial. Kustel admits the prevention of flouing of the quicksilver, and concedes also "that one or two pounds of sodium in a ton of quicksilver will undoubtedly show a good result if gold quartz is treated with it properly."

The negative results of one experimenter, especially when based upon an incorrect understanding, weigh but little against the concurrent positive results of many others.

Mr. Wurtz then goes on to show that others, versed in the amalgamation of silver ores, do not concur in opinion with Mr. Kustel, and quotes from a communication of Mr. R. S. Kimball, of this city, which appeared originally in this paper on the 14th of April, 1866. He also quotes from Prof. Silliman; from Mr. Thos. Belt, in the *London Mining Journal*; T. A. Readwin, of North Wales, England, in a letter to Mr. Moschimer, of this city, and others; all of which, more or less *in extenso* has appeared in previous numbers of the MINING AND SCIENTIFIC PRESS, and which it would be hardly worth our while to re-produce in the present connection. Mr. Kustel will probably see, for the first time, in the issue of to-day, the full remarks of Mr. Wurtz, to the garbled report of which he took objections in his communication to this paper, which appeared in our issue of Oct. 6th. It is possible, that on reading the same as now published, he may see fit to modify the opinions he then expressed.

The new steamer *Oregonian*, built for the route between this city and Portland, Oregon, arrived here on the second instant from New York. She made the trip in sixty-eight days—the quickest time ever made. She is a first-class vessel in all respects. Her cost, including the engines, was about six hundred thousand dollars.

Mechanical.

The Industrial Applications of Steam.

It is wonderful to reflect upon the vast and varied applications to which steam has been referred during the past century. Although but a comparatively short time has passed since its almost only use was for pumping water from deep mines, we now find it nearly omnipresent; it is below and above ground; upon the sea as well as upon land. It is constantly relieving man from nearly all the drudgeries of labor, enabling him, by aid of its great powers, and universal applicability, to undertake work which, without its aid, could never have entered into his conception; at the same time it is as subservient as a little child, and fulfills its duties with a degree of reliability, promptitude and precision, which even the most skillful human hand could never accomplish. It is far less expensive and much more subject to control than human labor. It relieves employers from a state of dependence on the caprices or weaknesses always incident to such aid, when not controlled by education, and furnishes man with a power which knows no limit save that dependent upon the strength of the most enduring of material substances. Its application we have said is even now almost universal; yet, we see a constantly growing desire to still further enlarge the wide range of its use.

The steam engine is a man of all work; it is now indispensable assistant to the builder, contractor, manufacturer, merchant, ship-owner, farmer, miner, and even the barbers and farriers have recently pressed it into their peculiar service. To all it is a labor, time and muscle-saving agent. It fights our battles; it defends our harbors; it brings to the light of day the hidden minerals of the earth, the most of which, without its aid, would be lost to the service of man. It drives our merchant and passenger ships from port to port over wide oceans, and calivens and utilizes the interminable rivers which find their devious ways from the far interior of every country on the globe. It is fast covering every civilized country with a net-work of roads, along which the iron horse, set in motion by its tireless power, rushes with an almost irresistible force, and a speed which surpasses the eagle in his flight.

The slow, monotonous "yo-heave-ho!" which a few years since greeted the merchant whenever he passed along the wharves, and which kept his ships for weeks at their moorings, has now changed to the quick rattle of the donkey engine, by the aid of which a heavily-laden ship is relieved of her cargo and made ready for a return voyage almost as soon as the captain's landress has cleansed his accumulated stock of soiled linen. The farmer, too, comes in for his share of the benefits derivable from this universal labor-saving agent; and by steam he now rides over the fields at his ease, and the grain, as if in obedience to his presence, bows before him, and is gathered into stacks by arms that tire not, neither do they grow weak or weary beneath the scorching sun. The stacks of corn and grain are no longer hauled on slow-moving carts to the barn to await the winter's leisure for the operation of the threshing floor; but the steam engine, in one of its protean forms, some fine day, comes out into the field and rushes through the hard labor of weeks almost within so many hours. The farmer is justly proud of such valuable help, which consumes no food beyond a few sticks of wood, and that only while at work. Thus, on every hand, we see the steam engine being made subservient to the good of almost every conceivable avocation in which man can engage. What would become of the civilization and industrial interests of this nineteenth century were we to be deprived of the aid of steam without a compensating equivalent? It is the wonder of the age—the greatest instrument of social, intellectual and physical progress which the world has yet beheld.

PAPIER-MACHE is now used for molds for sugar refining, also in making casts for stereotyping.

An Aquatic Novelty.

Charles W. Anderson, of Memphis, Tenn., proposes a new form of water locomotion. His plan is for a cylindrical vessel, with an endless railroad track, like a set of hoops attached to the inner circumference, to roll over the water, instead of being propelled through it. His idea is this:

He proposes to build a vessel like a huge barrel, of about thirty feet diameter and about the same length. A railway track is built inside of the circumference of the barrel and of about sixteen feet diameter, with two tracks parallel and each side of it about four feet larger. His plan of operating it is to run a locomotive upon the middle track and loaded cars upon the two side tracks, and the weight of the loaded cars running up the circles will turn the cylinder, or rather it will recede from them, and, as it does so, he supposes it will travel over the water by means of V-shaped paddles that are fastened on the outside circumference of the vessel and running the whole length of it. He claims to be the original discoverer of this principle of locomotion, and asks capitalists who are interested in such schemes to share with him the success or failure of the invention.

The *American Artisan* comes in and dissipates his idea of novelty thus:

The same idea was broached about forty years ago and has been revived several times since. In 1853, patents were taken out by an American inventor in this country and in Europe for essentially the same thing and propelled in the same manner.

The same paper elucidates the impracticability of the idea as follows:

We fear that there are difficulties to surmount that Mr. Anderson has not yet found by experiment. The resistance of the water against the barrel-like vessel is much greater than he anticipates. In a stern or sailing vessel the water is displaced by the bow moving in like a wedge and cleaving a way; but in this new mode of navigation the vessel has to be rolled or lifted up, like rolling the barrel up hill, and it must either continually do this with a slow progress or else forcibly displace the mass of water before by some other mechanism than the weight of the cars that be proposes to be the motive power. Let him take a barrel, weight it in the manner in which he proposes to load his new vessel, attach strips of board as he proposes to attach the paddles of the *bona-fide* boat, put the barrel into the nearest creek, and, then, prepared *sans culottes*, roll it around for awhile, and if it proves any great thing of a steamboat we will "own up beat."

CALCULATING THE HORSE-POWER OF ENGINES.—In the English accounts of condensing steam engines—more especially those for marine purposes—and their power, we generally see statements of the nominal horse-power and actual horse-power; the actual power being always several times greater than the nominal. The actual horse-power is calculated from the record of the indicator; but the nominal is estimated by an arbitrary rule, which is explained as follows in a letter to *Engineering*, from John Bourne, the well-known engineer and author:

In Boulton and Watt's original rule for determining the nominal power of an engine, the pressure of the steam which was considered to be effective on the piston was 6.8 lbs. in the 4-horse power engine, and increased up to 6.94 lbs. in the 100-horse power engine. The velocities of piston for different lengths of stroke were taken as follows:

Length of stroke in ft.	2 1/2	3	3 1/2	4	5	6	7	8
Speed of piston in feet per minute	160	170	180	190	200	210	225	245

The pressure speed per minute multiplied by the assumed pressure, and divided by 33,000, gave the nominal power.

As it was difficult to remember these speeds and pressures, I gave a new rule in 1844, which assumed a uniform pressure of seven pounds per square inch, and which further assumed that the speeds varied nearly as the cube roots of the length of the stroke, which I found that they did very nearly. This rule, which is now very generally adopted, is as follows: Multiply the square of the diameter of the cylinder in inches by the cube root of the length of the stroke in feet, and divide the product by 47, which will give the nominal power.

An Albany man has invented a portable cotton gin of a new construction, which is claimed as being in some respects superior to the old one.

Scientific Miscellany.

Wilde's Late Electro-Magnetic Discovery.

In our issue of November 3d, we gave some account of a remarkable discovery, recently made by H. Wilde, Esq., of England, which is thought to exceed in importance all discoveries in electricity which have been made for many years. The details of the arrangement were not given in the account from which we made that notice; but we have since seen some particulars in the London *Quarterly Journal of Science*, which may aid the reader in arriving at a tolerably fair conception of the *modus operandi* employed by Mr. Wilde in obtaining the new and wonderful results which he reports.

The principle is not difficult to understand. An armature, wound round with an insulated wire, is made to revolve rapidly in front of the poles of a large permanent magnet. The currents of electricity thus induced in the insulated wire, are carried around a large electro-magnet, which is thereby excited to a high degree. In front of this electro-magnet a second covered armature is rotated, and the electric current thus generated is carried around a third electro-magnet. It is from a rotating armature in front of this third magnet that the electric current, ultimately used for heating or lighting effects, is produced. At each passage round the electro-magnets, and induction in the rotating armatures, the electric current becomes magnified to an extraordinary degree, until ultimately it is sufficiently powerful to melt iron rods fifteen inches long and a quarter of an inch in diameter. The illuminating power of the current thus obtained is of the most splendid description; such that, when placed upon the top of a building it casts shadows from the flames of street lamps a quarter of a mile distant. It is stated that the quantities of electricity thus obtained by far exceeded that attainable by any other means hitherto employed. In arriving at his grand result, Mr. Wilde first discovered the fact that a large amount of magnetism can be developed in an electro-magnet of much smaller power. Reasoning from this fact, and bearing in mind the additional fact that an electro-magnet, when excited by means of a voltaic battery, possesses all the properties of a permanent magnet, and that a large electro-magnet, if excited by means of a small electro-magnetic machine, could be made, by proper apparatus, to evolve a proportionate amount of dynamic electricity, he proceeded to prepare such an apparatus, substantially as described above. The results have more than realized his most sanguine expectations, and have excited a deep interest among English electricians.

In operating the machine, a small amount of power, only, seems to be required—not more, perhaps, than would be required to raise a blast sufficient to produce the same amount of heat in an ordinary blast furnace. It is confidently expected that ere long electric lights of the most intense description may be thus obtained; and it is by no means an improbable supposition that the heat so generated may be economically applied to practical purposes, or converted into power by means of the electro-magnetic engine, and employed in the place of coal to drive the steam marine of the world.

THE EFFECTS OF FROST ON THE BRANCHES OF TREES.—Professor Caspary, of Königsberg, Prussia, communicated to the International Botanical Congress, lately in session at South Kensington, England, the fact that the frosts of winter cause certain changes in the direction of the branches of woody plants; which movement is in direct proportion to the intensity of the cold. This change is not uniform in all woody growth, for it appears that the frost causes the branches of some trees to droop, and those of others to rise—the extent of the downward or upward movement depending upon the mildness or severity of the weather. In some instances the branches of the same tree exhibit both phenomena, rising when the frost is mild, and drooping when it becomes severe. The philosophy of the phenomena has never been explained.

Celestial Photography—The Moon.

Celestial photography gives good promise of soon revealing some important information in regard to the physical constitution of some of the heavenly bodies, particularly those of the sun and moon. It is already furnishing pretty strong evidence of the probable existence of the remains of an atmosphere in the moon, of great density, but of very small extent or elevation. Some of the phenomena presented in obtaining photographic representations of different portions of the moon's surface, can scarcely be accounted for on any other hypothesis—for instance, the difference observable between obtaining photographic representations of high and low portions of the moon's surface; for it must be remembered that a much greater difference exists between mountain and plain on the moon, than between those inequalities on the earth's surface. Elevations have been observed on the moon which are thought to be twelve or fifteen miles high, or above the general average of the plains. Admitting the existence of a dense atmosphere, small in extent, the photographic representation of a lone lunar plain, covered with a dense atmosphere, might well be supposed to exhibit a marked contrast with that of a mountain twelve or fifteen miles high, with scarcely the vestige of an atmosphere. If such an atmosphere existed, some of the plains of the moon may even yet be covered with vegetation, such as requires but little moisture. The large photographic pictures of the moon, recently obtained, are now being studied with much care and interest. They give a wonderfully minute representation of the lunar surface. Her coasts and cliffs, against which an ocean of water must at one time have benten, are clearly defined. Here is seen an unmistakable volcanic crater of eruption; there a vast swelling, which could only have been the result of some mighty power of upheaval, which was exhausted before it burst, and thus left, as it were, an uplifted, unbroken, opaque bubble! Depths are seen so profound that the light of the sun never illumines their lowest interior. It is thought that even glacial remains are traceable in the mysterious streaks of light which are seen to radiate from some of the higher lunar mountains. If such a supposition could be verified, the fact would be pretty clearly established that the lovely queen of night was once, if not now, clothed in a livery of green. From what has been done, we can but indulge the hope that important developments in this direction are yet in store; such as will be of no common interest to the inquiring mind. With regard to the moon, however, we can scarcely expect to reach any other conclusion than that now generally entertained by astronomers, that it is but a world in its decadence; that in the cooling of its mass, the water, which formerly existed upon it has been absorbed, and that the atmosphere, also, is fast finding its way into the crevices of contraction—a visible picture of what is to be the fate of our own mundane sphere—a freezing, rather than a burning up!

COLORATION OF FEATHERS.—The question of the change and variety in the plumage of birds, was recently discussed at considerable length, by M. Victor Fatio, of Paris. The question is asked: Is a new coloration always the peculiarity of a new feather, or may the coloration sometimes undergo alteration in the same tissues? It is claimed to be a matter beyond dispute, that when a feather has once grown, its color cannot be effected by nutrition, inasmuch as all communication between it and the blood vessels is at an end—the pulp having dried up. M. Fatio therefore attributes the alteration in the color of completely grown feathers to the humidity of the atmosphere, temperature, light, movements, and the fatty matter of the bird. The modifications produced by these agents, are the various developments of certain parts, the solution and diffusion of the internal pigment and the rupture of the external parts. It may not be out of the way to state, in this connection, that feathers can be as readily and permanently dyed with the aniline colors, as wool or silk. The colors should be dissolved in alcohol, diluted with water, quite warm, but not hot. Dye thoroughly, wash and dry. The process is simple, but effective.

WEEKLY STOCK CIRCULAR

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,
December 15, 1866.

CITY STOCKS.

San Francisco Gas Co. sold early in the week at \$64.75@64.50 per share. California Steam Navigation Co. at 66½@65½ per share. This company pays its usual monthly dividend to-day. The Bank of California disburses this day a dividend of 1½ cent. per month on its capital stock of \$5,000,000. Fireman's Fund Insurance Co. declared a dividend of 4½ cent. for the quarter ending with the present month, payable on the 3d of January. North Beach and Mission Railroad sold at \$46 per share. Spring Valley Water Co. paid its usual monthly dividend on the 10th instant. The Sacramento Gas Co., on the 1st instant, paid a dividend of ½ cent. per month on its capital stock. This, we understand, is the seventieth monthly disbursement from its surplus to the stockholders. We quote it at 75½ cent. asked.

Small sales of Legal Tender Notes transpired at 71½@72½, and at the close they are selling at 72½. A small amount of June 7-30 Bonds brought 78½.

MINING SHARE MARKET.

The Share Market has displayed rather less activity this week, together with a slight decline in most leading stocks. This has not been occasioned by any unfavorable reports, so far as we have been informed; but perhaps may be attributed to the realizing process going on for some time past by a number of large holders, who in selling out at the present prices obtain handsome profits upon investments made a few weeks since. Some of these parties have been "hears" this week, hoping to enter the market again as purchasers at low prices. We are pleased to state that six Comstock claims have declared dividends for the month of November. The Empire Co. increased its dividend from \$6 to \$15 per share, the Yellow Jacket paid \$75 per foot, in lieu of \$50 the previous month, and the Hale & Norcross will add an extra dividend of \$200 per foot out of the surplus now in the treasury of the company in addition to their regular dividend of \$100 per foot, payable this day. Another gratifying feature in this connection is, that most of these companies carry forward very considerable surplus balances in addition to the several amounts disbursed to stockholders.

We refer our readers to the annexed comparative statement of dividends declared:

COMPANY.	In November.	In December.
Hale & Norcross.....	\$100	\$40,000
Savage.....	75	60,000
Yellow Jacket.....	50	60,000
Crown Point.....	50	30,000
Empire Mill.....	6 p	7,200
Imperial.....	8 p	32,000
Totals.....	\$229,200	\$290,000

The following table shows the Bullion product of the leading Comstock claims during the month of November as compared with the yield in October:

COMPANY.	October.	November.
Yellow Jacket.....	\$180,288 67	\$202,080 27
Savage.....	210,000 00	241,000 00
Hale & Norcross.....	152,363 74	167,034 89
Gould & Curry.....	114,321 67	124,633 61
Crown Point.....	110,000 00	100,000 00
Imperial.....	95,380 00	82,640 48
Chollar-Potosi.....	60,000 00	58,962 15
Confidence.....	41,563 72	27,975 68
Empire Mill.....	42,000 00	45,000 00
Ophir.....	22,586 24
Totals.....	\$1,031,054 04	\$1,039,387 09

HALE & NORCROSS.—Not in the market during the week; \$2,500 per foot was bid. This company have obtained a depth of 22 feet in the west vein, and it is said the ore found at the bottom is very good. The actual returns of bullion in November amounted to \$167,034.89. This does not cover the 65½ cent. assay value exacted from the mills, and is attributable to the wet condition in which the ore was delivered. After paying out \$120,000 in dividends—\$300 per foot—this company has a surplus of \$90,000 in the treasury.

SAVAGE.—This stock was not so much in demand this week as last, but the late advance was well sustained, opening at \$2,015, then selling at \$2,060, buyer 5, and at \$2,040@2,050, seller 30, and closing yesterday at \$2,075. The average value of 1,997 tons of ore extracted during the week ending Dec. 8th is \$38.31 per ton. The 7th station continues to look well, and is said to yield a fair amount of good ore. Winze No. 3 is now about 80 feet deep, and still in ore. The southwest drift, on the lower station of the south mine, passed through the west seam of the Hale & Norcross claim. At this point no ore was obtained,

and drifting is continued towards the Hale & Norcross ground, where it has been very productive. On Dec. 1st the estimated value of 4,832 tons of ore at the mine and mills was \$218,509.85, and, deducting all expenses of milling, etc., leaves a net balance over liabilities of \$150,973. The total yield of bullion in November amounted to \$231,000.

YELLOW JACKET—has been active, advancing from \$1,400, buyer 5, to \$1,410, receding to \$1,295@1,287.50, and closing at \$1,260. In working from the winze in the lower level it is said that recent developments disclose a vein from eight to ten feet wide, containing considerable first-class ore. The drift in the north mine is 155 feet east from the shaft, and is supposed to be not far from the vein. A surplus of about \$3,000 over liabilities will remain on hand after paying the dividend of \$75 per foot declared for this month and payable to-day. The stock of supplies at the mill and mine amounts to more than \$49,000, but on this there still remains due some \$10,000. At the Morgan mill about 1,700 tons of ore have been accumulated. From the report for the month of November we extract the following: Tons of ore mined, 8,813; reduced, 7,127; yield of bullion, \$202,090.26; average, \$28.35 to the ton. Men employed, 255.

CROWN POINT.—Few feet changed hands during the week, receding from \$1,200 to \$1,180, then to \$1,170, and at the close sold at \$1,200. During the week ending Dec. 7th, 990 tons of ore were taken from the mine. The vein on the 400-foot level is now opened 145 feet, and is said to show a fine body of ore, which, it is thought, will average \$40 to the ton. The east drift from the 400-foot station is now in 210 feet, and carries white quartz. Preparations are completed to commence to sink for the 500-foot level. A dividend of \$50 per foot was declared, payable this day. The yield of bullion during November was about \$100,000.

GOULD & CURRY—was dealt in to a larger extent than usual during the past week, improving from \$690 to \$730, then to \$775, receding to \$700 @650, and at the close selling at \$660. We learn of nothing new in this mine. In our next issue we expect to give a detailed statement of this company for the fiscal year ending November 30th.

CHOLLAR-POTOSI—advanced from \$236 to \$245, receded to \$235@237.50, and closed yesterday at \$224. The average yield of ore taken from the Blue Wing station is said to be about \$30 per ton, and it is thought that 100 tons of ore per day will soon be taken from this level. At 150 feet south from the shaft, on the fifth station Potosi, a winze 20 feet deep is said to show some good ore. The ore in the first station of the new shaft is now six feet wide, with every prospect of its widening as they drift north. In the second station, the clay has given out, and porphyry and small seams of quartz have been found. During the week ending Dec. 8th, 945½ tons of ore have been sent to custom mills; previous week, 726 tons.

OPHIR sold at \$240, buyer 30, then at \$235, declined to \$229, dropped to \$205@202.50, and closed at \$205. A fourteen-inch pump, extending from the ninth to the tenth gallery in this mine—a distance of 100 feet—will shortly be in operation.

EMPIRE MILL has met with considerable activity, improving from \$220 to \$200@195, and at the close sold at \$195. The yield of bullion for the month of November amounted to \$45,000, and a surplus of 3,000 tons of ore is now on hand at the mine.

IMPERIAL was sold at \$135, improved to \$145, declined to \$138@130, then sold at \$132.50, and closed yesterday at \$140. The receipts from the first clean-up amounted to upwards of \$18,000, and the surplus ore at the Rock Point mill, on Dec. 1st, aggregated 3,200 tons. The ore in the Alta and Holmes mine is improving, and both of the company's mills are in perfect order and running at full capacity.

CONFIDENCE opened at \$95, then sold at \$97.50, receded to \$85 and \$75, and at the close sold at \$85. The bullion returns for the month of November amounted to \$27,975.69, being \$13,588.03 less than the October yield. BELCHER advanced from \$140 to \$145, gradually receded to \$127.50, and at the close sold at \$118.

OVERMAN has not been as active the present week as for some time past, selling within a range of \$17.50@14. Assessment of \$10 per share levied on the 12th instant. BULLION sold at \$16@12; and SIERRA NEVADA, to a large extent, at \$4.75 @6.75, then sold at \$4@3, and closed at \$5.25. On the 11th instant, an assessment of \$4 per share was levied by the Trustees.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$830,900.25.

Professional Cards.

SHERMAN DAY,
Mining Engineer,
No. 57 Montgomery Block, San Francisco.
Will examine, survey and report upon mines, and consult and advise concerning investments in mining property, the machinery management and expenditures of mines.

FREDERICK MANSELL,
Mechanical & Architectural Draughtsman,
No. 422 California street, corner of Leidsdorff.
Drawings of Monks made for parties applying for patents at Washington or London.

JAMES M. TAYLOR,
Attorney and Counsellor at Law,
COURT COMMISSIONER, appointed by the Fourth District Court, COMMISSIONER OF DEEDS for Nevada and Massachusetts.
Court Block, San Francisco.
Entrances opposite City Hall, Merchant street, and 638 14th St.

W. E. GOLDSMITH,
Card and Seal Engraver,
505 Montgomery street, up-stairs, (over Tucker's.)
SAN FRANCISCO.
Wedding and Visiting Cards printed with the utmost neatness; Notarial, Commissioner and Society Seals.

DR. H. AUSTIN,
DENTIST,
No. 634 Washington Street,
Between Montgomery and Kearny Streets
[OVER SAN FRANCISCO RATES]

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

ANSTED'S Gold Seekers Manual. 1 vol. 12mo. cloth.	\$ 1 75
ANTISELL.—The Manufacture of Photogenic or Hydrocarbon Oils, from Coal and other bituminous substances, capable of supplying Burning Fuels. By Thomas Antisell, M. D. 1 vol. 8vo.	3 00
BUCKLAND (Rev. Wm.)—Geology and Mineralogy. 2 vols. 8vo. cloth.	10 00
DUFRENOY.—Mineralogie. 5 volumes, 8vo.	20 00
DANA'S Manual of Mineralogy. Revised edition. 29 illustrations. 12mo. cloth. New Haven.	2 25
DANA'S Manual of Geology. Numerous illustrations. 8vo. half morocco. Philadelphia, 1833.	6 75
DANA'S Text-Book of Geology. Illustrated. 12mo. cloth. Philadelphia, 1844.	2
ELDERHORST'S Blowpipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1866.	1 50
FAIRBAIRN.—Iron: its History, properties, and Processes of Manufacture. By Wm. Fairbairn, C. E., LL. D. 1 vol. 8vo. New Edition.	4 00
FEUTCHWANGER.—A Treatise on Gems. 1 vol. 8vo. cloth.	1 75
GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury, from the German of Th. Bodeman and Bruno Kerl. 1 vol. 12mo. cloth.	2 60
HUMBLE.—Dictionary of Geology and Mineralogy. Third Edition, revised. 1 vol. 8vo. cloth.	9 00
HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth.	16 00
KUSTEL.—Nevada and California Processes of Silver and gold Extraction, for general use, and especially for the Mining Public of California and Nevada; also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. Illustrated by accurate engraving. 1 vol. 8vo. cloth.	5 00
LAMBORN.—Rudimentary Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated.	1 00
LAMBORN.—Rudimentary Treatise on the Metallurgy of Silver and Lead. 1 vol. 12mo. limp cloth. Illustrated.	1 00
MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth.	10 50
MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By C. H. Makins. 1 vol. 12mo. cloth. Illustrated by upwards of 50 engravings.	3 50
OVERMAN (Fred.)—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgical Operations. 1 vol. 8vo. cloth.	7 50
PIGGOT.—The Chemistry and Metallurgy of Copper. By A. Snowden Piggot, M. D. 1 vol. 12mo. cloth.	2 00
PHILLIPS AND DARLINGTON.—Records of Mining and Metallurgy, or, Facts and Memoranda for the Use of Mine Agents and Smelters. By J. A. Phillips and John Darlington. 1 vol. 12mo. cloth.	4 00
PERCY (John).—Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth.	13 50
PLATTNER AND MUSPRATT on the Use of the Blowpipe. 47 Diagrams. Third edition, revised. 8vo. cloth. London, 1854.	6 00
Practical Use of the Blowpipe; being a Graduated Course of Analysis. 12mo. cloth. New York, 1858.	2 00
SCOFFERN'S Useful Metals and their Alloys. 1 vol. cloth.	5 50
SMITH'S Blowpipe—Vade-Mecum. The Blowpipe. Characters of Minerals Alphabetically Arranged. 8vo. cloth. London, 1852.	1 75
URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London edition. 3 vols. 8vo. cloth. New York.	16 50
WHITNEY.—A Geological Survey of California. Report of Field work from 1850 to 1854. By J. D. Whitney. Per vol quarto.	3 75
WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth, 12mo. San Francisco, 1865.	1 00

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address,

Baldness! Baldness!!

CAN BE PREVENTED, BY USING

Mayhew's Balsamic Hair Stimulant!

THIS REPARATION HAS BEEN USED AND RECOMMENDED by some of the most prominent members of the medical profession of this city.

For the removal of DANDRUFF, SCURF, for preventing the Hair from falling off, and for producing a new growth, IT IS WITHOUT A RIVAL.

For particulars and references, see circulars accompanying each bottle. Prepared by

W. E. MAYHEW, Druggist,
N. W. Corner Fourth and Howard streets San Francisco.

He gives his personal attention to the preparation of Physicians' prescriptions.
Also, has constantly on hand a choice assortment of French, English and American Toilet Articles. 16v13-6w

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalled with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Metallurgy.

To Copper Miners and Others Interested in the Working of Copper Ores.

THE UNDERSIGNED HAVING BEEN APPOINTED Agent and Attorney by H. Haskell, for the sale of his COPPER SMELTING FURNACE, which has proved a perfect success in preparing to furnace the same to parties having Copper Ore, or will make arrangements to buy their Ore, receivable at their mines. For further particulars, apply to
JOHN N. KISDON,
At Coffey & Ridgway, San Francisco.

MARTIN & CO.,

Office, Stevenson House,
Corner California and Montgomery streets (up stairs)

WILL CONTRACT FOR THE

PURCHASE OF COPPER ORES.

Assaying eight percent, and upwards of Copper to the ton. We will make advances upon Ores of Copper. San Francisco, Post Office Box 1299. 22

THE PROPRIETORS are at all times prepared to work or test

Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphur, pyrites, and the so-called "refractory ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, reducing by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also well extended Laboratories for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

IMPORTERS,

AND DEALERS IN

ASSAYERS' MATERIALS,

Druggists' & Chemists' Glassware,

Photographic Stock, Etc.

512 and 514 Washington Street,
SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERTLING (London) and BECKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,

And from Franco and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, Etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast. A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.

San Francisco March 6, 1866. 11v10-1f

IMPORTANT

Mining Summary.

Tax following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the *Miner* of Dec. 8th: The team loaded with the balance of machinery and material for the Washington mill arrived at the mill yesterday. Capt. Uzman may be able yet to get out his first "brick" before Christmas.

Mr. E. Arnold, last week, in seeking the best point from which to run a tunnel to open the Somanuk extensions of the Mowyer and Mahogany lodes, up Lexington Cañon, discovered two other and well defined veins of quartz lying parallel with and below the two named. Mr. A. located for the company 2,000 feet on each, and named them the "Keystone" and "De Kalh." The whole series can now be opened by a tunnel and great depth attained.

From the Silver Mountain *Bulletin* of Dec. 1st: In the George Washington mine the ledge has gradually widened for the last twenty feet run in the tunnel. It is now full five feet in thickness, and the ore as rich as ever.

Amador County—

From the *Ledger* of Dec. 8th: The Newtown mine is proving richer and richer every day. We have before us a piece of ore taken from the pile at the shaft that will assay at least fifty if not sixty per cent., and there is plenty more of the same sort at the bottom of the mine.

The Butte Basin Mining Company, at Butte City, has been incorporated with a capital of \$216,000.

A letter to the *Times* from Volcano, Dec. 9th, gives these items: The mines around Volcano are looking better than ever. The Golden Gate has taken out \$1,900 during the last five days' run with their ten-stamp mill. The Vaughan Company is making a run through the Fogus mill of 200 tons of rock, and during a week past they were taking out rock that will pay \$1,000 to the ton. Heretofore, rock from this mine has paid only about \$14 to the ton on an average.

The Italian mine, now owned by Senator Rose, it is reported, is doing well at Sutter Creek. The Railroad, running parallel with the Hayward, 400 feet east, seems to be a permanent mine, and the parties working it are now working 300 feet from the surface, and are taking out rock that averages \$18 to the ton. The Mahoney brothers have in one place paying ore ninety-seven feet in width on their lode.

The Mechanics' Quartz Company is having 100 tons of rock crushed at the Wildman mill. A. W. Rose is building a new mill on Sutter Creek, about a mile above town. The Sacramento owners in the Wildman mine are still driving a shaft, 500 feet from the surface, south, with a good prospect ahead. Last, but not least in importance, in the way of new quartz mills, we have C. T. Meader & Co. now located here, and building and running mills for reducing sulphurets. Their enterprise leads us to consider that we are about to see a new era in quartz mining, for there are now four of these mills, the property of Meader & Co., running in this county.

Butte County—

Bangor correspondence of the *Marysville Appeal*, Dec. 7th, says: A short time since a company from Virginia City sent their agent over here to prospect the famous "Blue Lead." He commenced operations in a shaft belonging to Barnum & Co. They went at it with a "will," working day and night, until about two weeks ago, when they found what they were looking for—"rich dirt." It pays about eight dollars per day to the hand, and some of it prospects one dollar to the pan.

The North American Company have commenced work on their claim. They are also putting up a water wheel for the purpose of drawing the dirt and water to the surface. It is their intention to prospect the lead thoroughly. H. G. Kendall has a new shaft down fifty feet on his claim and the work is going on finely. The Buckeye Company have also commenced work on their claims. They expect to sink their shaft about 180 feet before they strike "bed rock." There have been a good many of the old claims and shafts taken up, but there is plenty of ground left yet.

Calaveras County—

From the *Chronicle* of Dec. 8th: Latimer & Co. have for some time been opening the Merrimac on Central Hill, and ten days ago struck into the old channel, running through Chile Gulch and Stuart's Hill, and with the labor of five men for six days, took out 108 ounces of gold, worth nearly \$2,000. The Monitor claim adjoining, on the same channel, is being worked with a flattering prospect. There are many other claims in this vicinity paying cleverly for the labor done upon them. A company has also struck rich quartz, and

took out, in a hand mortar, \$1,500. This was the result of two men's work for ten days.

Colusa County—

From the *Sun* of Dec. 8th: We have seen several specimens of smelted copper from the Ashton works. It had only undergone one process—that of roasting—but it showed a very great proportion of copper. The company are more sanguine of success than ever.

El Dorado County—

From the *Placerville Courier* of Dec. 8th: The indications at present are very strongly favorable for an increased activity in quartz mining in this county. News comes in from time to time, from various quarters, of new and rich discoveries, and renewed energy in working old claims. Many claims heretofore abandoned for want of confidence or lack of practical knowledge or capital for their proper development, and various other reasons, are again being worked; and with the new and improved facilities discovered and being demonstrated for saving gold from different qualities of rock, there is a strong probability that much quartz that would not pay the expense of working a few years ago, will prove richly remunerative now.

A correspondent of the *Union*, writing from Latrobe, Dec. 2d, says: A few days ago Hitchcock and Cory took up claims on a quartz ledge, about six miles northeast of Latrobe, which appears to be the "mother ledge." It is about fifteen feet in width, and prospects immensely rich. The Monitor claims, on Big Cañon, have been sold recently to parties at the Bay, who are putting up the necessary machinery for pumping the water and working the quartz.

The Tullock Company near Brownsville, cleaned up, last week, forty-three pounds of amalgam from 100 tons of rock.

The *Alta's* Placerville correspondent writes, Dec. 5th: Prospecting has received a new impetus. Mr. Shepard, a few days ago, commenced prospecting a lode of decomposed quartz, which had been traveled over for years by learned professors and called sandstone. At the depth of two feet he found solid quartz rich in gold. During the first four days he picked up and panned out over eight pounds of gold. Gov. Blaisdel has an extension of the ledge. The Manning mine has been sold to Judge Turner.

The same writer visited the now noted Woodside mine. While there, four candle boxes were hoisted from the mine in the tub. He says, "I have no hesitation in saying that one-third of the contents of those boxes was bright, pure gold." The slah, which has been mentioned turned out to be porous and brittle, and had to be broken up. I saw pieces of it which weighed four and five pounds. Under the pilotage of Mr. Porter, foreman of the underground work, we descended into the mine, and fairly walked to the end of the drift on a vein of gold.

Inyo County—

A letter from Kearsarge to the *Territorial Enterprise*, under date of November 30th, has the following: The Kearsarge company own several lodes, but thus far have done work only on the Cliff and Kearsarge. They own a fine 10-stamp mill. There is now "in sight" forty or fifty tons of very rich ore, that will undoubtedly pay from \$150 to \$500 per ton.

The Alturas company own fourteen lodes. The ore from the Silver Spout has worked by mill process over \$100 per ton, and by a roasting process, on a small scale, yielded at the rate of \$940 per ton. The company are about selling out to a San Francisco company, and it is proposed to erect a mill and work the lodes on a large scale. Two miles north are the Hughes' ledges—forty in number. This company have been offered and refused to take \$50,000 for the group. On Piñon Creek, to the south, a large lode, from four to ten feet wide, assays from twenty to sixty-five dollars per ton in gold. Lower down in the valley are a number of lodes located by Mexicans in the Lower Pine district. One of these is rich in gold, and is twenty-five feet wide. The others seem richer in silver.

Mariposa County—

From the *Gazette* of December 18th: Dr. Lawrence, we have been informed, made a discovery recently of a rich quartz vein, near the old Beasley place, a few miles west of the town, of Agua Fria. The ore will pay from \$200 to \$300 per ton, and the dirt alongside the ledge yields from fifty to seventy-five cents per pan.

A new and rich quartz lode has been discovered near Agua Fria. The ore has assayed from \$200 to \$300 per ton.

Nevada County—

From the *Gazette* of Dec. 6th: The Manzanita mill has been compelled to temporarily suspend operations by the breaking of the flange of the hurdy-gurdy wheel. Owing to the cold nights since the rain ceased, the water has not yet increased enough to induce owners of mill claims to commence work.

From the same of the 8th: Two hundred tons of rock from the Consolidated Wisconsin and Illinois mine, recently crushed at the

Gold Hill mill, yielded \$65 a ton. Besides this, fifteen tons of sulphurets were saved, valued at \$150 per ton.

We saw yesterday some very fine specimens of gold-bearing quartz from the Cunningham mine.

The Gouge Eye Co's sluices were robbed last week and the blocks left lying loose. The next morning the blocks were washed away before the mischief was discovered. This will lead to considerable delay and expense.

From same of 11th: We were shown yesterday some fine specimens of ore from the Mary Etta ledge, situated on Diamond creek, three miles above Omega. The specimens show free gold and sulphurets in abundance.

From the *National* of Dec. 5th: We understand that several thousand dollars in specimens were taken out of the incline of the old Gold Hill mine the other day. An old miner, who has been here since 1850, tells us that he never saw richer rock.

Same of 10th: Works are to be erected at the Eureka mine for the purpose of working the sulphurets by the "chlorination process." Hitherto it has been found impossible to work these sulphurets successfully.

Charley Stewart, an employee of the Empire mine at Grass Valley, on the 1st instant picked up a gold specimen in Woodpecker Ravine valued at \$275. The rock weighed twenty-eight ounces, and contained sixteen ounces of gold.

From the Grass Valley *Union*: Tracy & Bell have struck rich gravel in their claim on Squirrel creek. They have been engaged for some time in running the tunnel. The Cambridge mine is at last well opened, and the prospects of its proving a first-class mine are flattering.

From the *Transcript* of Dec. 4th: A ten-stamp mill is soon to be erected at the Whigham mine. The ledge is twenty inches wide. The rock averages \$60 to the ton. We understand that parties from San Francisco have taken a contract to erect a twelve-stamp quartz mill upon the Big Blue lead, owned by the Murchies.

From same of 5th: Eureka District stock is on the rise, and a large amount of capital has recently been invested in that vicinity. The Young ledge, owned by Black & Co., has been well prospected. The last two runs amounted to 180 tons, and averaged \$20 to the ton. Booth & Co. have erected two arastras and a crusher upon their claims. They are down forty feet on the ledge, and find it four feet in width. They have 130 tons of quartz at their mill. The Liberty Mining Company, Col. Bragg and others, have leased a five-stamp mill belonging to Col. Jackson. The Liberty tunnel is in 300 feet, and they have out a large lot of rock. The ledge owned by Snapp and others has been sold to a German company for \$8,000. The purchasers have already started a tunnel near the mill of Black & Co., which will be 800 feet in length, and will strike the ledge at a great depth below the surface. Reasoner Bros. have out about one hundred tons of rock from their ledge, which will be worked at Black & Co's mill.

From same of 6th: Very rich rock was struck in the Pennsylvania mine, a day or two since. Rock could be selected which would pay over \$1,000 to the ton.

From same of the 8th: The Best Chance mine is upon the ridge beyond Canada Hill. A short time since machinery was erected upon the ground by Mr. Sherwood, of Marysville. They are now down upon the ledge 75 feet, where it has widened out to four feet. The rock is of a bluish color, and is filled with sulphurets. A considerable amount of free gold can be seen. The Amazon mine is a short distance from Nevada, in the direction of Gold Flat. The incline is down over 100 feet. The ledge is of good size and well defined.

Excelsior.—From the *Sun*, Dec. 1st: At a late meeting of the Excelsior Company, it was resolved to close the mill for the present. We learn that assessments will be levied until a sufficient sum has been collected to pay off all indebtedness, and put the mill and machinery in good working order.

Twenty-seven tons of Pacific rock, of which only 22 tons was supposed to be paying ore, was worked at the Winton mill. There remained, after retorting, 29 ounces of bullion, of the assayed value of \$378. Five tons of sulphurets were saved.

The present population of Excelsior is between 500 and 600. Mendoza, Ossaville and Paris have been deserted for a month.

The Gold Hill *News* says the snow is five feet deep at Meadow Lake, but the people are enjoying themselves with dancing parties, etc. The California Co. have resumed work. The Pacific has most cheering prospects. The U. S. Grant is running its mill all the time. The Golden Eagle is hard at work.

Placer County—

From the *Stars and Stripes* of December 5th: Quite a number of miners and prospectors have arrived in town.

A private letter from a friend at Iowa Hill, says the late rains have filled the ditches with water, and that "piping" and sluicing will be carried on at a lively rate.

From the *Dutch Flat Enquirer* of December 8th: Our miners are now blessed with an ample supply of water. The Yuba ditch is running full, the Dutch Flat canal affords a good supply, and Hall's ditch furnishes several heads. The consequence is that hydraulic operations on a grand scale are being prosecuted with extraordinary activity, and our hillsides fairly hum with the music of falling waters.

Shasta County—

From the *Courier* of December 8th: The Washington company at French Gulch, have cleaned up, after a month's run, the sum of \$2,008. We understand that the owners of the Chicago ledge have made arrangements with Colonel Walsh to prospect the claim from this time until the first of March, with the privilege of purchasing. James Blackburn has struck a rich claim on a bar of Trinity river, opposite Myers' ranch. The ground prospects as high as \$1.50 to the pan. On Sunday morning last, Henry Moats found a gold nugget, weighing 2½ ounces, near the main road, below Salt Creek.

Peck & Ellsworth have leased the Ohio lode, for the purpose of prospecting, and have the privilege of purchasing at the expiration of the lease. They are now sinking a shaft, and have already struck rock of great richness.

In removing the foundation upon which the battery of Loag's old quartz mill stood, several hundred dollars' worth of amalgam was found.

In Flat Creek the Brumfield brothers are working a bar claim that pays from six to eight dollars a day to the hand, and they have ground enough to keep them employed for years to come. George McKean owns a claim in which he averages from four to five dollars a day.

Sierra County—

From the *Messenger*, Dec. 8th: The Sierra Buttes mill cleaned up recently, \$38,000. The Good Hope Company had one hundred and thirty tons of unpicked rock crushed at the Gold Bluff mill, from which they realized \$3,000.

The diggings of the Hawkeye Company at Howland Flat, filled with water two or three weeks since, in consequence of which all work was suspended. The company have let a contract for a new tunnel, at a level sufficiently low to drain all the ground.

The Slug Cañon mill and mine are rapidly coming into working order. The shaft has been put down about forty feet and breasting commenced.

"Dan de Quilla" writes Dec. 1st, from Downville to the *Enterprise* thus: The tunnel in the Mammoth has just cut the lead—forty-five feet in. This vein is rich in fine gold. The Boston Company who have purchased the old Wheeler claims, are getting the dilapidated works into shape. They have a new flume, and the mill will soon start up. The Good Hope are taking out excellent ore, which is being reduced at the Gold Bluff mill. The Gold Bluff Company are running a tunnel to their lead, which will tap it several hundred feet below the surface. To-day there arrived from the Reis mine, Sierra Buttes twelve miles above here, \$42,000 in gold.

Siskiyou County—

From the *Yreka Journal* of Nov. 30th: On Scott river several mining companies have taken out their wheels and mining apparatus in anticipation of a rise in the stream.

Notwithstanding the great excitement about rich quartz on Humbag creek, the placer diggings are also holding their own in paying handsomely.

Toulumne County—

The *Herald* says the miners have plenty of water, and are busy at work.

NEVADA.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of Dec. 5th: The bullion has accumulated so fast at the stage office for the last day or two that the usual stage could not take it all. A ton of it thus accumulated.

From same of 6th: On Monday evening the Sierra Nevada "struck it" at a distance of about 150 feet from the shaft, or nearly 400 feet east of the Comstock ledge. When they cut through the casing a large body of water rushed in, preventing further progress. It rose in the shaft some five feet in a short time, but by means of haling over since, the water has got reduced somewhat, and in a short time the merits of this new discovery will be determined. The Imperial and Empire Companies are getting the requisite timbers, etc., ready for their new hoisting works, which they propose erecting at their new shaft in February.

Reports from Kearsarge are favorable. The mill is running on ore from the Kearsarge

mine, crushing at the rate of about six tons each twelve hours, the mill not running nights. The ore yields an average of about \$100 per ton, although some of it will yield much richer. Mr. Pierce has already shipped 270 pounds of bullion, worth \$4,000.

From same of 7th: The Empire Company, at Gold Hill, have got the water all out from the lower level of their mine and resumed operations at that point where, it will be remembered, a new body of ore was encountered a short time since. The value of this new development will soon be ascertained.

The new 120-horse power engine of the Gould & Curry Company, at the Bonner shaft works is hard at work pumping. There is still about fifty feet of water to get out before the sinking of the shaft will be resumed. Another hoisting engine of 80-horse power will be completed and started into operation in about a week.

From same of 9th: An amalgamator in the Confidence mill, below Devil's Gate, was suspected of stealing amalgam. He was watched and detected in the act. His room-mate was informed of his arrest, and he was watched. He soon after went to his room and thence to a privy. The officers pounced upon him but a moment too late. A night-work contractor was sent for. His labors were rewarded by the discovery of fifteen pounds of amalgam.

From the Virginia Union of Dec. 6th: The Rhode Island mill was, a short time since, thoroughly overhauled. It now has a new engine of 150-horse power, four boilers, twenty-five stamps which crush fifty tons of ore daily, and eight new Humphreys pans, four settlers and two agitators. The Illinois mill, at Dayton, has recently been renovated. Twenty stamps, six pans and two settlers work twenty tons daily of Yellow Jacket ore.

Forty miners left Virginia City on the 5th inst. for the sink of the Humboldt, to work on the mines of the Uticu Company. A 10-stamp mill will be immediately erected.

From the Gold Hill News of Dec. 5th: In the Yellow Jacket they have at the present time, more good ore than at any time since the mine was opened. In the old works while drifting, they came upon one of the most extensive and rich deposits ever found in the mine. The company are taking from that deposit alone some 150 tons per day. They have already drifted into it seventeen feet and find nothing but pure pay ore. From the new works the company are taking out a large amount of excellent ore. The Crown Point mine has a large body of first class ore, which promises to be one of the most extensive ever found in this mine. The Savage and Hale & Norcross are taking out a large amount of good ore, while the prospects of the Gould & Curry and the Chollar-Potosi, are of an encouraging character.

A cave occurred on the north side of the Trench mine, next to the Eclipse, a day or two since, which took down with it a large portion of the south wall of the Eclipse hoisting works.

Reese River—

From the Reveille of Nov. 30th: The Commercial Company, located on the Smoky Valley ledge, has a tunnel 284 feet long. We learn that the original Smoky Valley Company has sold its property in New York. The property had been opened by a tunnel 350 feet in length. The Smoky City location, also on the Smoky Valley ledge, and several other locations, have been sold to certain parties in Sacramento City, under whose management work will be resumed. Our informant believes that the Everett Company will again undertake operations on the return from the East of its superintendent. The Colfax ledge, about eight miles from Austin, in Smoky Valley District, was recently sold to parties in New York City, who are now making preparations for active work. The series of ledges lying between Geneva and the Colfax mine, known as the Onmargo S. M. Co., have been sold to a substantial company. The indications are, that the district of Smoky Valley will soon present a scene of activity and prosperity.

Operations continue active at Hot Creek. The Indian Hunter has a shaft eight feet in depth. The ledge exhibits eight feet of quartz, in which there is a stratum of extraordinary rich ore one foot in width, which, according to estimates, will yield \$600 per ton. The Mountain Eagle, in Rattlesnake Cañon, improves, and in an incline ten feet deep exhibits a vein of six feet, from which some six tons of ore are on the dump that will pay \$150 per ton. The Old Dominion is looking beautifully over its whole width of eighteen or twenty feet, from the surface to the bottom of its ten-foot incline, and develops rich and improving mineral. The mill of the New York Company will be running by January 1st.

From the same of Dec. 3d: Yesterday afternoon Col. Buel and M. D. Fairchild returned by the way of Silver Bend from a trip to the Reveille District. The Colonel brought in 8,458 ounces of bullion. We learn from M.

D. F. that the mill is enclosed and repaired, and will now yield a larger measure of bullion than ever. The Highbridge mine is developing beautifully. Mr. A. Monroe left this morning for Ophir Cañon, to take charge of the Twin River Co's mill.

Same of 4th: Paxton, Thornburg & Co., bankers, in Austin, make the following report: In October, we shipped \$24,477.28. Of this amount we received \$8,603.51 from Col. Buel's mill at Silver Bend. In the month of November we shipped \$64,160.28. Of this amount we received from R. B. Canfield, Superintendent of the Twin River Mining Company, \$35,436.19, and from Col. Buel's mill at Silver Bend, \$16,474.05.

Same of the 5th: "Notes of a Prospector" says that in the Highbridge mine the entire mass of ore in sight, amounting to thousands of tons, will, at the most moderate computation, average \$100 per ton.

Four hundred feet on the Transylvania ledge No. 1 was purchased by Col. Buel and S. Wood for \$11,000 in coin. Six men worked four days in stripping the ledge, when they were offered an advance of \$20,000 upon their purchase money, which was declined. They now have the vein opened for a distance of 160 feet and to the depth of 20 feet. It is about eight feet thick, estimated to average \$100 per ton. The Bateman & Allen opens up well. The Canfield, of 2,000 feet, has been purchased by an Eastern company, who will at once erect a mill.

From same of 6th: The Belmont mill, at Silver Bend, whose "head and front" is Col. Buel, has a battery of ten stamps, a half dozen Varney pans, and is producing at the present time about one thousand dollars' worth of bullion each day. The ore is not roasted, being crushed wet, and yields about seventy per cent. of the pulp assay. This ore is from the Highbridge mine, and can be supplied in unlimited quantities—from 50 to 100 tons usually lying at the door head of the battery. Ten stamps will be added in the Spring.

In Cortez District, work is progressing on the Taylor and Passmore and the Cortez Giant mines. Preparations have been made to continue work on the former during the winter. The Cortez Giant is being worked with more than usual vigor, and some fifty men are employed. The ore is packed over a very rough trail a distance of seven miles to the mill. One hundred and twenty-five mules are employed, making one trip daily, each mule carrying 400 pounds.

In the Buckeye mine, North Twin River District, the vein improves beyond expectation. The mill of the Manhattan company will commence crushing on Monday next. Some 9,000 ounces of bullion were received in town late yesterday afternoon from the Twin River Mining Company. It would not be at all surprising if that splendid property yielded fully \$60,000 the present month.

The Alta of Dec. 8th says: We have been shown some of the richest silver ore that has ever been brought here in quantity. It is from the Palmetto mines, of Silver Peak District, Nevada, the property of a New York company. The freight on the ore to this place was \$180 per ton. Part of it will be worked here and part shipped.

Humboldt—

From the Register, Dec. 1st: In the Essex, a ledge three feet four inches has been struck 300 feet from the surface. The ore is estimated to work about \$80 per ton. This is a most important event. It prospects a large claim, owned by a company abundantly able to keep on with the work and prosecute it to the shipment of bullion; but it does more—it prospects to entire satisfaction the old claims on the same series of ledges, known as the "Tallulah," the "Honey Lake," and the "Empire."

At Oreana the smelting goes on well. The refining process has not yet been perfected.

The Gem is in a fair way to re-assert its pre-eminence. A week ago, the workmen struck a vein of as fine metalliferous quartz as was ever found in the upper prospects. It was in a tunnel, running off from a shaft, and about 100 feet from the surface. The ledge is full two feet in width. The ore is of the class known as \$80 ore.

The New York Company, operating on an extension of the Mouroe Series, has struck an excellent ledge—six feet in width, well cased, the quartz assaying about \$100 in gold to the ton.

Esmeralda—

From the Union of Dec. 1st: Messrs. Silvers & Lott have recently re-opened their old claim situated on East Chance Hill, and have struck a ledge of some four feet in thickness at the bottom of the works. The ledge discloses a fine body of pay ore. Several very rich streaks of gold bearing rock and silver sulphurets course their way through the ledge. One of the strata of sulphurets is not less than two inches thick and will pay one dollar per pound.

R. H. Evans formerly superintendent of the Real Del Monte has returned. It is understood that he will re-open the mine, and start the mill.

The Walker River mines are exciting considerable interest here and in other portions of the State. We learn that steps are now being taken by parties from Virginia City in connection with other gentlemen for the purpose of erecting a first class mill immediately.

A letter to the Territorial Enterprise from Wilson's district says: Messrs. Cheever, Pray and Todman have purchased the Bodie mill at Aurora, and say they will have it in here and running in sixty days. Others talk of putting up mills. New discoveries are being made almost every day, and the only question now to be settled is depth.

A 4-stamp mill has been shipped from Aurora to Columbia district by Col. Young. Ore from the district has been worked in Dayton, which yielded from \$90 to \$360 per ton.

Pahrnagat—

The Reveille of Nov. 30th says: The prospects of Pahrnagat are just now very encouraging. Late explorations have opened a short and direct route from Austin to the very core of that district, so easy and free from the ordinary natural obstacles, that it is said loaded wagons will experience no difficulty in making the trip in a short time. The five-stamp mill of the Pioneer Company, erected by Mr. Raymond, was to be started up on the 19th of November. At the Illinois ledge, 75 to 100 tons of ore were ready for the mill.

IDAHO.

From the Owyhee Avalanche of November 24th: What is known as the middle tunnel of the Hays & Ray has been made to connect with the Poorman discovery. The tunnel follows the exact line of the Hays & Ray vein, and is over 450 feet in length, and taps the Poorman discovery 150 feet below the surface. Mr. Peck informs us that this tunnel shows a ledge from two to three feet, containing ore in character the same as the Poorman. The Silver Cord dump pile contains nearly seven hundred tons of the richest quality of ore, and the "indications" improving, if any change. The works embrace about seven hundred feet of tunneling and shaling. Vulcan ledge, believed to be an extension north of the Silver Cord, is one of the best mining interests in Owyhee. The owners are taking out huge quantities of ore of satisfactory richness.

The same of December 1st: The Wehfoot mill has been engaged for several weeks in prospecting ledges for different parties. A sample of several tons from the Noonday gave satisfactory results; but the most encouraging test was that of the Woodstock. The Whisky Gulch ledge is being constantly worked upon, and is gradually developing into a large and very well defined interest.

The Idaho City Times of 20th of November credits the following to the Bulletin, a new paper: The tunnel of the Mountaineer company is going on at a rapid rate, and is now in over 250 feet. The rock prospects well by hand process.

MONTANA.

From the Post of November 24th: Corbett, the mining engineer, has been engaged in constructing works for the Boulder Ditch company, at Diamond City, which will be finished before May 20th, 1867. The water will be conveyed from one side of Confederate Gulch to the other, through an iron tube seventeen hundred feet in length and fifteen inches in diameter. The trestle work that supports this tube will be eighty feet in height.

"Lost Horse Gulch" is about thirty miles from Helena. One of the newly returned prospectors shows the proceeds of one pan of dirt taken from this gulch—about \$3.50 of beautiful gold, none of the particles being smaller than a large pin-head, while the largest is about the size of a sugar pea. The claims have been laid over until the 15th of May next.

A real stampede took place from Helena on the morning of the 15th. Some of the Minnesota boys struck upon some very rich diggings in the neighborhood of Uncle Ben's Gulch, and came in and gave the wink to their friends. The result was that over one hundred persons, chiefly Minnesotians, left in haste to stake their claims. The diggings are said to be about twelve feet in depth to the bedrock, and to turn out coarse gold and nuggets weighing from fifteen to one hundred dollars.

A letter to the Copperopolis Courier from Montana City, dated October 30th, has the following: The claims are all laid over till next May. I feel well satisfied with the country, and think there is gold here in sufficient quantities to pay. The country is not as yet prospected, and cannot be worked out for years. The gold lays deep. We find mountains with beds of washed gravel to the very tops. In the ravines and gulches the bedrock is from ten to thirty feet deep, and in many places the miners are unable to get down at all on account of water.

COLORADO.

From the Black Hawk Journal of Nov. 20th: About a mile west of the forks of James' creek, a new belt of lodes has lately been discovered, cutting through a hill 400 or 500 feet high. These are gold lodes with dirt crevices, prospecting fifty fathoms to the pan, and from two to six feet in width. Stanley & Co. brought in seven or eight ounces of gold taken out of this dirt with a rocker. It is very fine. None of them has been sunk upon more than twenty feet as yet. About thirty lodes have been struck on this hill. The entire face of the hill for several acres in extent prospects from five to ten cents to the pan. There is no water nearer than from a fourth to a mile. It can be brought in any quantity from the St. Vrain, by a ditch four miles long.

From the Register: The shipments of gold have constantly increased since the 1st of July, the shipments of July being \$11,067 more than the shipments of June. The August shipments exceeded those of July by \$15,502. September shipments showed an increase of \$37,357, over August. While the increase of October is \$3,574, exclusive of Smith & Parmelee, whose October yield was not shipped until November. Including this the increase in October will not fall short of \$30,000.

Messrs. Cushman and Cressy of Central are putting up a 9-stamp mill in Ward district, which they will soon have running.

From the Denver News of Nov. 21st: The Pioneer Company's mill now in successful operation at Montgomery, made a clean-up on the 10th instant and got a very nice chunk.

The Nonpareil Mining Company is composed almost exclusively of printers. They have some of the best lodes in the Territory, a portion of which are situated in the Snake River region.

The burning of the Ni-Wot mill, in Ward district, aside from the pecuniary loss to the company, is a great loss to the country, and will prove a heavy drawback to the advancement and prosperity of mining enterprise in the district where it was situated. This mill was one of the most complete in the Territory. The works had just been completed, and everything was in the most perfect running order. The ore from the mine has been fully tested. On the day following that on which the fire occurred, the whole fifty stamps were to be put in motion for the winter campaign. The gold already taken out, before the whole battery was set, had placed stockholders in jubilant spirits. The expenses for supplies for winter had all been met, and the same safely stored for use. There was no possible danger of failure. Ward mining district is thrown back at least a year in its mineral development.

The principal coal mines of this Territory, that are now opened, are situated in Boulder county. Among these the "Kitchen" bank is the most celebrated. The Kitchen bank is now opened for a distance of about one hundred and sixty feet, and shows a vein twelve feet in thickness. The vein has increased gradually from eighteen inches on first opening, to its present proportions. Several new veins have been discovered during the present season. The mines now worked are mostly situated near the Belle-Mont iron furnace and foundry. The late discoveries extend down the Boulder river ten or twelve miles below Boulder City.

The great bulk of iron ores yet discovered in the Territory, like the coal, is found in Boulder county. The ore is of the variety known as limonite, and is found in patches, from which large masses are frequently taken. These pockets are very numerous. On assay the ore yields seventy-six per cent. It is easily melted, being in combination with an excellent flux of manganese. The iron obtained is of the best quality, being soft and of that blue appearance on fracture that is deemed desirable by foundry men.

OREGON.

It is reported that very rich deposits have been found lately at Randolph, near the mouth of Coquilla river, about forty miles north of the famous gold beach. They were discovered in an old beach formation, three hundred feet above high water, and are paying \$50 per day to the hand.

BRITISH COLUMBIA.

From the Colonist of December 1st: The excitement at Quesnelmou, Cariboo, concerning the quartz discoveries on Hixon Creek, is increasing; about fifty men will winter on the creek. Another vein, apparently rich, has been discovered and named the Poorman.

A BATHER at a French watering place has invented a novel galvanic battery. A disc of cork is covered by one of zinc, with a layer of charcoal between. The cork is set afloat, the sea water serves as an excitant of the zinc, and by means of a wire, a current of sufficient power to ring a bell, is conducted to the shore.

Mining and Scientific Press.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. SAN FRANCISCO, Jan 11th, 1866.

Mr. Thos. J. Hall, is an authorized agent for this journal for the northern counties of this State. Dec. 1, 1866.

Mr. F. E. Frost, is an authorized agent for the PRESS for Amador and Calaveras counties. Dec. 1, 1866.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

San Francisco:

Saturday Morning, Dec. 15, 1866.

NOTICES TO CORRESPONDENTS.

S. B., SONORA.—In place of there being much doubt about this contemporaneous existence of man, and some of the larger extinct mammals, the evidences accumulated of late years go strongly to affirm the correctness of such a theory. It is quite evident that the diluvial placers around your city have been deposited at a period when the mammoth and its congeners roamed over the contiguous country, whilst the occasional discovery of charcoal in the same layer of soil, which contains tusks and other animal remains, goes far to render it probable that man existed at the same period. During the last twenty years, the attention of European archaeologists has been largely concentrated in collecting materials, illustrative of the probable social condition of primitive and pre-historic man. It is gratifying to know that these efforts have been attended with an amount of success truly surprising, when it is reflected how unpromising was the original prospect. The presumed, but continually changing boundary line, existing between archaeology and the period of the disappearance of certain extinct animals, has also engaged the attention of many experienced parties, eminent in various branches of geology, such as Owen, Prestwich, Lyell, etc., etc., all of whom consider that man, and several of the animals alluded to as now extinct, lived contemporaneously. The opinion so countenanced has been recently remarkably strengthened by the discovery, at the rock-shelter or semi-cave of La Madelaine, in the South of France, of a fragment of fossil ivory, which had engraved upon it a well-defined figure of the mammoth or *elephas primigenius*. The artist has, in his delineation of the animal, as depicted in an engraving representing the same, which we have seen, not only very clearly and correctly formed the chief outlines and characteristics of the elephantine genus, such as the head, ears, trunk, etc., but also the peculiar eccentric curvature of the tusks appertaining to this extinct genus, and has also marked, in the most unmistakable manner, the long hairy mane, which, it is known, from the frozen carcass found in Russia, that this animal possessed; a fact which indubitably proves that the artist must have been contemporaneous with the mammoth.

This, and similar delineations of various other animals, about the same age, possess a high value as showing the artistic germ in human beings, even prior to a sufficiently marked development of constructive ability, as would be required to design and form an artificial habitation.

Pascal has observed that the "entire succession of man through the whole course of ages, must be regarded as one man always living and incessantly learning." The first man who lifted himself above the beasts of the field, by the discovery that a sharp stone or a snare would subserve the purpose of obtaining food better than his unarmed, unaided limbs, laid the foundation of arts and sciences.

COMMUNICATIONS RECEIVED.—From Doctor Lonsweert, on "The Use of Iron Sponge for the Reduction of Metal Sulphides and Antimonides; from C. H. Aaron, on "The Concentration of Sulphurets;" and from Geo. H. Belden, giving some account of "The Oregon Iron Company's Works at Oswego, Oregon;" all of which will appear next week.

"A MINER" sends us a communication on the "Working of Gravel Cement," but forgets to enclose his real name and address, without which no communication can receive attention.

PROGRESS OF THE RUSSIAN TELEGRAPH.—The officers of the expedition have returned to San Francisco for the winter. Some 2,000 miles of poles have been thus far erected in Asia and America, and exploring parties are still in the field, preparing for a vigorous prosecution of the work in the spring.

"THE WURTZ AMALGAMATION COMPANY"—EXTRAVAGANT IDEAS.

The circular recently issued by the "Wurtz Amalgamation Company" has been read by us with no little surprise. The terms on which the company therein proposes to place the sodium amalgam before the public, seem to us to be singularly absurd. Instead of simply selling the article, the company sells licenses to use it, as well; and the exalted notion of its value which the managers have, is apparent from the following:

"One twentieth interest in their joint stock, or in the mining and milling property, will entitle partiss to the right to use the process during the continuance of the patents."

It is, however, made optional with the party to "purchase the license for such sum, in cash, as may be mutually agreed upon." Some notion of the price which would probably be demanded, can be formed from the first quotation. The amalgam will be sold to licensees only; and will be, for No. 1, \$3, and for No. 2, \$4 per pound.

It is scarcely necessary for us to say, that these terms will never be accepted. Pacific Coast miners "don't do business in that way." Show them an article which will be of use to them, and they will try it, and if satisfactory, buy it; but they are averse to taking out licenses, or paying royalties. "A trade is a trade;" a stipulated price is paid for an article, and "there's an end;" but endless disputes and difficulties are the consequence of an indefinite bargain, such as one must always be where the amount to be paid is dependent on a contingency. Neither would the idea of making over a portion of their interest be agreeable to the miners. The multiplying of partners and dividing of interests, is at best not desirable; and to induce them to do this before it is distinctly proved to them that they will be the gainers, will be impossible.

Then, again, as to the price asked. The coolness with which a one-twentieth interest is demanded in the property of a company which may be willing to make trial of a new invention, the applicability of which, to all cases, is by no means established, is really refreshing. Suppose the property should be worth a million, or so, as in the case of the Hynward mine? How much, "in cash," would this company be willing to commute for? Probably not less than one-twentieth of that amount—say, \$50,000! Truly, a modest price!

We do not wish to under-rate the value of the sodium amalgam. We are satisfied that in many cases it is a most valuable aid in collecting the precious metals. But there are unquestionably some of our ores, in the working of which, its use, so far from being an aid, would be a positive detriment. Each claimowner must determine for himself, by actual experiments, varied and repeated as he may choose, whether he can use it to advantage. All the *ex cathedra* assertions of all the scientific men in creation, will not, alone, satisfy him. The miners on this coast are sufficiently acute to have learned by this time that theory and practice do not always go hand in hand in mining matters. In fact, they have seen so much humbug "science," that they are often unduly distrustful of an innovation, although perhaps when fairly tried it is really found to be an improvement.

The action of this company is only another proof of the extraordinary ignorance which the people of the Atlantic States have always exhibited in regard to the manners and customs, and the "ways of thinking," of the people on this side of the Continent. When, however, we recall to mind the assertion made recently by a Californian in New York, that he could find but a single copy of a San Francisco journal, after searching the reading-rooms of four or five of the principal hotels, this ignorance will not seem so remarkable.

It may be said that the course proposed by the company is the only one by which they could protect themselves; inasmuch as their claim covers, not the amalgam of sodium with mercury—which is not patentable—but the use of that amalgam in the working of ores. But

why should not the sale of a pound of the amalgam include the right to use a pound, and no more? Parties detected in using the article for mining purposes, who could not show that they purchased it of duly accredited agents of the company, could be notified of the infringement, and on its repetition, prosecuted. A properly drawn circular, distributed widely throughout the mining region, would leave no ground for a plea of ignorance of the company's rights and claims. We see scarcely more difficulty in the management of this patent, than in that of any other. However this may be, it is certain that the plan announced in the company's circular will not answer. We speak for their good, as well as for that of the mining community; and it is to be hoped that they will so modify their present absolutely suicidal policy, as to secure, as soon as may be, a firm first footing for what is undoubtedly a valuable discovery.

A SINGULAR FORMATION.

Mr. George Johnson, of Auburn, Placer county, has furnished us with some facts, with regard to a somewhat singular formation which was discovered sometime in September last between Spanish Dry Diggings and Spanish Bar, on the Middle Fork of the American river, El Dorado county. The discovery was made by a party of miners who were engaged in ground sluicing on the hillside some 1,500 feet above the bed of the stream, and consists of a well-defined vein of light talcose slate, running through a country rock of black, silicious clay slate. There is no appearance of quartz in the vein, which is from four to ten miles in width, and very rich in gold, mostly coarse and rough, like quartz gold. It is said that these men have taken out as much as 135 ounces of gold in two weeks, by reducing the vein rock in a hand mortar and working the same in a pan. The company is known by the name of Roush & Co.

Sulphurets are often found in slate rock, rich in gold, where there are no indication whatever of a lode of any kind. It will also be seen, from the notice we have made of the above mentioned discovery in El Dorado county, that it is not always necessary to look for quartz as the matrix of gold. When drifting through rock, for any purpose, any especial change therein should be carefully noticed; and when sulphurets are encountered, there is special reason for expecting to find them containing gold in paying quantities. An assay should always be made to test their value. It is but a few days since a most valuable discovery was made near Placerville, in a lode deposit, over which travel had been continued ever since 1849. The deposit was overlooked, simply because it showed no quartz; it proved, however, to be a decomposed deposit of iron and quartz, which at two or three feet from the surface was exceedingly rich in gold. Miners cannot be too watchful and observant in their labors; they doubtless often miss a fortune from lack of sufficiently close observation. Persons who may be conversant with anything noticeable in this way will confer a public benefit by communicating such information through the public press.

CABINET OF NATURAL CURIOSITIES.—Few, perhaps, are aware that there is such a place as a cabinet of Natural History worth visiting to be found in the city. Passing up Pine street, a few days ago, we accidentally dropped in at Mr. Lorquin's establishment, a few doors above Kearny, and were astonished at the collection he has on hand, in the form of shells, birds, butterflies, insects, and other curiosities too numerous to be given in detail. In addition to matters of scientific interest, there are here found shell-flowers, shell-frames, and many groups of birds for parlor ornaments; also, feathers and birds for ladies' hats, together with a large and rare assortment of ornaments, all tastefully arranged under glass, and put up expressly for the approaching holidays. Such a variety of natural curiosities is seldom seen, and Mr. L. is never happier than in displaying them to his visitors, who are amply repaid for the time passed in his cabinet.

YALE COLLEGE.

We have received a copy of the catalogue of the officers and students of this institution for 1867. The Faculty and instructors comprise 35 Professors and 15 Tutors, in addition to the President, Librarian and Curator. The total number of students is 559, divided among the respective departments, as follows:

Theological.....	30
Law.....	26
Medical.....	31
Philosophy and Arts (Sheffield School).....	122
Academical Department.....	350
Total.....	559

One of the most interesting and important departments connected with this institution is the "Sheffield Scientific School," founded some ten years ago, and since greatly enlarged, mainly by the enlightened beneficence of Mr. J. E. Sheffield, whose name it bears, and whose total donations amount to about \$150,000. The Legislature of Connecticut has also appropriated to this institution the Congressional land donation coming to that State.

This is the only institution in the United States that fully meets the growing demand for scientific instruction, which the rapid development of the material resources of the country is rendering one of our first educational necessities. Measures have recently been taken to organize a Mining Section, in the scientific department, in accordance with a plan sometime since formed. This section will be conducted upon the most approved European models, modified to meet the more practical peculiarities of American ideas. Both the science and practice of mining and metallurgy will be taught in the most thorough manner, and the fullest opportunities will be afforded for laboratory practice, including assaying, chemical analysis, the determination of the character and value of ores and furnace products, and the discrimination of minerals. The lectures on mining and metallurgy will be as full and complete as in any similar institution in Europe. This department is well supplied with models and diagrams of mines, machinery, furnaces, etc., and contains a large and valuable collection of minerals systematically arranged; suites of ores and furnace products, illustrative of mine and furnace work; an extensive collection of fossils, arranged according to geological succession, etc. The full course of mining will include from four to six months' practice in the field, in the study of actual mining operations and smelting works, to be followed by special engineering or chemical studies, as applied to mining and metallurgy. The libraries connected with the college, all of which are available to students in either department, number 77,500 volumes, embracing every class of literature and every branch of science.

THE VALUE OF TOWN SEWAGE.—The economical results obtained from the application of a portion of the Edinburg sewage to some meadow land near by, is summed up in the fact that the proprietor realized the sum of \$862,000 by an outlay of \$22,500, in putting under irrigation about 250 acres of his land with a portion of the sewage of that city. The question of the utilization of the sewage from towns and cities, is at the present time attracting a large share of attention among both practical and scientific men in Europe; and numerous experiments are in progress similar to the one cited above. We presume in that case the land was situated at a lower level than that portion of the city from whence the sewage was obtained; and that it was taken to the land by artificial drains, and not by cartage. When agricultural lands are thus situated, relative to city drainage, there can be no question as to the practicability of utilizing such drainage; but when the conditions are such that drainage must be moved by cartage, and perhaps artificially prepared, the utilization thereof must be a matter of close calculation. There are those, however, who are working heartily at the problem, and express the fullest confidence in being able to show that the drainage of almost any large town may be thus economized. The city of London is one to which much attention is now being given in this direction. The experiment cited above is certainly a most encouraging one, and leaves a large margin for unfavorable conditions.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, occasion may demand, new and important inventions. Also, the list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

MACHINE FOR TENONING TIMBER.—Hugo Hochholzer and Frank Denver, Virginia City, Nevada, claim the clamping in clumping and turning the timber or log by means of certain devices, as described in their specifications; also the holding and presenting the timber or log to be tenoned, to the cutters, by the means and in the manner therein described.

STEAM PROPELLER FOR BOATS.—Allexey W. Von Schmidt, San Francisco, Cal.: In combination with a propeller pipe, arranged either inside or outside of the vessel, but below the water line, and one or more stationary steam pipes, the ends or nozzles of which are within and point respectively towards the openings of the propeller; I claim one or more valves or cocks arranged so that a column of steam may be projected at pleasure through either nozzle, thus inducing a current of water through the propeller pipe, as and for the purpose shown and described.

QUARTZ CRUSHER.—Monroe L. Batell, New York city, claims an ore crushing machine constructed with two sets of crushing jaws, operated by a single intermediate shaft, substantially as described in his specifications.

QUARTZ REDUCER.—H. H. Scovillo, P. W. Gates and D. R. Fraser, Chicago, Ill., claim a corrugated cylinder, constructed so as to revolve and elevate the quartz or other substances, in combination with one or more hollow cylinders, which are corrugated and perforated circumferentially so as to admit and conduct the quartz or other substances, after they have been elevated into and out of the chambers of such cylinders, having an opening in each end, so that the quartz may be fed in and discharged continuously. They also claim a corrugated cylinder, perforated entirely through its shell, substantially as and for the above described purpose. Also the construction and arrangement of the cylinders so that the substances to be operated upon are free to pass through the circumferences of the cylinders, and be at the same time subjected to a grinding and crushing action between the said cylinders, substantially as described. Also the construction of the corrugated lining of the cylinders, which has axial supports, with caps and channels, substantially as described.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In *every* case it takes to operate through Eastern agents. From our familiarity with the subject of California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE.

DEWEY & CO.,
Patent Agents, 505 Clay street, San Francisco.

HOSE SEWING BY MACHINERY.—We recently took occasion to call in at the hose-sewing establishment of Mr. S. Howard, 326 Davis street. Mr. H. manufactures all kinds of cloth hose, for hydraulic and other purposes, by the use of machinery. The machines operate with great rapidity and precision. The heaviest material of cotton canvas is converted into hose with all ease. The machine sews three seams at once, with sixteen or twenty-ply twine. Hose thus made will stand the pressure of from 100 to 200 feet fall. Two hundred yards per day can be sewed, at twenty-five cents per yard, making fifty dollars for a day's work. Mr. H. tells us he has two of these machines idle. Why does not some enterprising party purchase one of them, and introduce their working capacities—quick and strong sewing—into some of the newly discovered mining localities, where extensive hydraulic operations are required?

EUREKA, HUMBOLDT COUNTY.—We learn that the effort, by means of an artesian well, to obtain a supply of fresh water at the wharf, in Eureka, for the use of the steam-tug and other vessels, has proved a success. The well is situated at high-water mark, is about 104 feet deep, passing through sand and blue clay. The water stands at the level of the ground at low tide; but at high tide it flows freely from the pipe. Though the tide influences the flow, the water flowing is fresh, and well suited to the purpose desired.

Shipbuilding has been fairly commenced in Eureka. The Messrs. Consins will soon be ready to launch a fine schooner, equal to any in model and workmanship, though not near so large as the bark they launched last year.

MOTT'S PATENT DOUBLE-REVOLVING PLOW.

This highly important invention having been perfected, its superior advantages are now offered to the public. Orders for the same, accompanied with the money, will be promptly filled if addressed to JOHN MOTT, San Francisco, through Wells, Fargo & Co's Express, and a letter through the P. O. at the same time. The two first premiums were awarded to Mr. Mott, at the last Annual

State Fair, for his Double Plow, in competing successfully with single and side hill plows. Price \$55 for the double, and \$28 for the single plow.

Mr. Mott would respectfully inform all persons having inventions difficult to perfect, that he can be consulted at his office, where he has specimens and models of his own inventions, which he will exhibit as proofs of his scientific and mechanical abilities. He will aid those having inventions which they may wish to perfect, so that the same

may be accomplished at the least possible expense and with the greatest dispatch. He has great facilities for examining patent records; and will inform parties, for a moderate compensation, whether or not their inventions are of a patentable nature.

Apply at Fisher & Newman's Law and Land Office, S. W. cor. of Montgomery and Jackson streets, San Francisco, Room No. 3, 2d floor. Office hours from 9 A. M. to 5 P. M. 1t

CHEMICAL ACTION OF WATER IN THE FORMATION OF MINERAL VEINS.—Water doubtless acts a most important part, not only in the formation of mineral veins, but also in the general metamorphism of rocks. Experiments show that by immersing wood in water, heated to a temperature of from 300° to 350°, anthracite coal may be produced. At a lesser degree of temperature, bituminous coal is said to have been produced. In this connection, it may be interesting to call to mind the recent experiments of M. Bertholet, of Paris, to which we alluded in the last issue of the Press, by which that investigator has made the important discovery that at a high temperature various hydrocarbons combine with each other and with free hydrogen, to form higher carbides of hydrogen.

De Lenarmon, by the aid of water, raised from 150° to 350°, has produced samples of most of the minerals composing metallic veins, such as quartz, the carbonates of magnesia and zinc, spathic iron, sulphate of baryta, sulphide of antimony, mispickel, and ruby silver. These illustrations of the metamorphic chemical action of hot water, are most interesting studies, especially when taken in connection with the most undoubted fact, that nearly the whole surface of the earth was, at a comparatively recent period, but a seething cauldron of boiling water, holding in solution all the various salts which enter into mineral combinations; and with which the sedimentary formations, previous to the pliocene period, must have been saturated. The science of Geology, as it progresses, is attaching more and more importance to this great agency in the metamorphism of rocks and the formation of mineral and metalliferous veins.

THE NEW YORK METAL MARKET.—Winterhoff's New York Metal Circular, of November 2d, reports a still unsettled market, with but little demand from the South and West. The then approaching elections, and the general belief that gold would fall heavily, are the reasons assigned for the prevailing apathy.

Tim.—Has declined to 20 3/4 @ 21c. for Straits. Six to eight hundred slabs of Banca sold in small parcels from 23 1/2 @ 24c. gold. English is quoted at 21 1/2 c.

Spelter.—Has fallen to 6 1/4 c. gold, for Silesian, with sales of 125 tons.

Copper.—The demand has nearly ceased since the middle of October. A few forced sales only have been made at 30c. for Lake. One great cause of the decline in demand for copper, is on account of the almost total destruction of the ship-building interest. The production is also smaller than formerly; the stocks moderate and prices lower.

Lead.—The quotation has not varied from 6 3/4 c. gold for ordinary. The best English is quoted at 7 1/2 c. gold.

THE BAKED LOBE, COLORADO, is situated on Kelso mountain, about thirty miles from Central City. It was discovered in 1865. The average assay from the samples was \$838 per ton. Recently, Mr. Watson, who has an interest in the lode, and has been making an effort to raise capital to open it up, selected a ton of the ore, unroasted, which, on smelting, produced 600 pounds of lead, and two tons from the John Brown lead, which, under the same treatment, produced 800 pounds. On cupelling the 1,400 pounds, 25 pounds Troy of pure silver was obtained, which, at \$1.35 per ounce, amounts to \$405. Owing to the imperfect arrangement of the works, which were very hastily erected, the Colorado Journal thinks this is no test of the ore. Mr. Watson is going on to perfect his arrangements in the most careful and elaborate manner, and is satisfied he has the best mine in the Territory.

FRANK LESLIE'S PUBLICATIONS.—John Stratman, the enterprising newsman on Washington street, has placed upon our table his special edition of Frank Leslie's Almanac, for 1867, designed particularly for the Pacific coast. This almanac contains, besides a great number of really fine wood engravings, a large amount of valuable and interesting miscellaneous reading matter, spread out over a small quarto of upwards of sixty pages. Mr. Stratman is special agent for the Pacific coast for all of Frank Leslie's publications. Subscribers supplied here at New York rates.

ENGLISH STEAMER ON THE HUDSON.—There has recently been added to the towing fleet on the Hudson river an English side-wheel steamer—a blockade runner—which was caught during the war, and had been recently sold by the Government to an ice company. This rakish looking vessel is called the Diamond, and is painted black. Her hull is iron, arrow-shape, with raking pipes, horizontal engine, which turns a patent feathered water-wheel. Being unlike any other vessel of the kind on the river, she naturally attracts attention.

City Amusements.

METROPOLITAN.—The Martinetti-Ravel Troupe, commenced the week at this house with the beautiful pantomime of "The Golden Egg," which bids fair to have a long run. It abounds in startling tricks and transformations, and one is well repaid for an evening spent here.

OPERA HOUSE.—At this house, Lady Don has appeared in a variety of pleasing pieces during the week.

ACADEMY OF MUSIC.—The wonderful Troupe of Japanese Jugglers and Acrobats were transferred from the Opera House to this theater on Thursday night, in order to obtain the necessary light for some of their tricks. They have created an intense interest, as the crowded houses during the week will bear witness, and in their acrobatic feats exhibit a skill and training rarely witnessed. Some of the slight-of-hand tricks are very well done.

HOME INDUSTRY.—Joseph Wagner, a "Marysvillian," and an old hunter, finding there was no market for the thousand or two deer-skins, which were the result of his work for the last year or two, has started a glove factory. His gloves *take*, and are likely to supersede the imported. Several hands are now employed in his establishment.

NATURAL CURIOSITIES FOR CHRISTMAS.—At No. 522 Pine street, E. P. LORQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shell and Wax Flowers, besides Feathers, Birds and Butterflies, for ladies' hats, Shells, Sea-weeds, etc. 24v13-qr

Air Pump for Sale.—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JOHN ROACH, mathematical instrument maker, 522 Montgomery street. 21v13-9p

ALLEN'S LUNG BALSAM!

For the Cure of Consumption and all Diseases of the Lungs.

This BALSAM is introduced to the suffering public after its merits for the positive cure of such diseases have been fully tested. The formula from which it is prepared is referred to by the leading medical journals as being equal to any prescription that can be made up, for such diseases, by the medical faculty. The BALSAM is, consequently, recommended by physicians who have become acquainted with its great success. As an expectorant it has no equal. DR. A. L. SCOVILLE, who has, for many years, been known to the public throughout the United States as the inventor of remedies for the lungs, recommends ALLEN'S LUNG BALSAM as surpassing anything that has ever been offered to the public for the cure of Lung Diseases. He has used it in his own family with great success in the case of his sister, who was supposed to be in the last stages of consumption. This lady is now well, and has been permanently cured by Allen's Lung Balsam. 22v13-1in

To Capitalists,

GOLD QUARTZ MINE, SITUATED IN CALAVERAS County, with steam mill fitted up with Amalgamating Pans, etc., FOR SALE. The mine has three main veins, and more than \$20,000 have been spent in opening them and completing the mill. Good wagon roads all the way. Apply to BELLOE FRERES, Bankers, 535 Clay street, San Francisco. 23v13-6m

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Bag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Gams, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

U. J. BOOTH. GEO. W. PRESSCOTT. IRVING M. SCOTT.

Machinists and Foundries.

PALMER, KNOX & CO., Golden State Iron Works,

Nos. 19, 21, 23 and 25 First Street,
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

MACHINERY, STEAM ENGINES AND QUARTZ MILLS

DUNBAR'S IMPROVED Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight;
without excessive friction, and never
gets slack or leaky.

WHEELER & RANDALL'S NEW GRINDER AND AMALGAMATOR

HEPBURN & PETERSON'S AMALGAMATOR AND SEPARATOR,

Tyler's Improved Water Wheel,

Giving the greatest power, at lower cost, than any
Wheel in use. There are over 1,500 runnings,
giving universal satisfaction.

KNOX'S AMALGAMATORS, WITH PALMER'S PATENT STEAM CHEST, Superior for working either Gold or Silver Ores.

Genuine White Iron Stamp Shoes and Dies

Having been engaged for the past eight years in quartz
mining and being conversant with all the improvements
either in Mining or Milling, we are prepared to furnish, at
the shortest notice, the most perfect machinery for reduc-
ing ores, or saving either gold or silver. 13v10qy-tf

WILLAMETTE IRON WORKS, PORTLAND, OREGON.

Steam Engines, Boilers, SAW AND CRIST MILLS, MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.

TWELVE HOUR SHIFTS.—A correspondent of
the Reese River *Reveille*, very properly re-
commends to the superintendents of mills "a
change in their programme in the roasting de-
partment. He says: "At present, the men in
charge of some of the twenty furnaces are kept
on duty twelve hours at a time. It is needless
to inform millmen that the effects of this long-
shift system are very serious indeed to the
interests of the company—in preventing the
ore from yielding the percentage which under
a more judicious management it certainly
would yield. In cases where the ore is known
to be rich but peculiar, care is necessary, in
order to secure a yield of eighty per cent. of
the fire assay. If the roasters were on duty
only six or eight hours, they could give that
attention to the stirring of the ore which it
really requires; but on twelve-hour shifts,
human nature is not capable of standing the
strain the labor demands, and, as a matter of
course, the ore is not properly roasted, and the
yield of bullion is greatly diminished. The
men at work on the furnaces are not to blame;
the fault lies with the superintendent of the
mill in his expecting or desiring the workmen
to undertake impossibilities."

BRONZED GUN BARRLS.—The *Mechanics
Magazine* says that the movements of our army
during the late war of Rebellion, were several
times disclosed by the gleam of polished gun
barrels. Movements that were intended to be
secret, were thus made known to the Confed-
erates by the sheen of the sun or moon. The
authority alluded to says a gun barrel, even for
sporting purposes, ought never to be polished;
it should be bronzed. Sighting over a pol-
ished tube is both tiresome to the eye and
diverting to the view. No thoroughly educated
sportsman ever uses a polished gun barrel.
Polishing gun barrels is but the remnant of the
old nonsense about "the pomp and circum-
stance of war." Better drop it altogether.
The subject is one of considerable importance.

CALIFORNIA BRASS FOUNDRY.

No. 125 First street, opposite Minna,
SAN FRANCISCO.

ALL KINDS OF Brass, Composition, Zinc, and Babbitt Metal
Castings, Brass Ship Work of all kinds, Spikes, Sheathing
Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and
Gongs of superior tone. All kinds of Cocks and Valves, Hy-
draulic Pipes and Nozzles, and Hose Couplings and Connec-
tions of all sizes and patterns, furnished with dispatch.

PRICES MODERATE. 18v13-ly J. H. WEED.

A "DARK DAY" IN LONDON.—One of those dark days which occasionally occur in the city of London, in consequence of dense fogs and other states of the atmosphere which prevents the heavy coal smoke from rising and being carried away by air currents, occurred on the 18th of October last. The day was so dark as to cause an almost total suspension of business. Navigation on the Thames was impossible; and people stumbled through the streets in a more than midnight darkness, that was not relieved by the light of the gas lamps at noon.

BELLAMBI COAL!

A SUPERIOR ARTICLE OF
SMITHS' COAL,

FOR SALE IN QUANTITIES TO SUIT.

At Greatly Reduced Rates.

DR. O. DUNNING,

Respectfully informs the public that he treats ALL DIS-
EASES the human system is afflicted with, and
can be found at his office.

Rooms Nos. 13 and 14 Government House
Corner Washington and Sansome streets,
18v13-6m SAN FRANCISCO, CAL.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Vane's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

GODDARD & COMPANY.

BROWN & BEADLE,

Offer their services to

INVENTORS AND THEIR ASSIGNEES,

—AS—

PATENT SOLICITORS.

They will make Preliminary Examinations in the Patent Office, with a view to ascertain the Patentability of any invention that may be submitted to them for that purpose; will prepare the necessary papers for those who wish to make Applications for

Patents for their Inventions,

—OR FOR—

EXTENSIONS OR REISSUES OF PATENTS

Already granted; will act as Attorneys in presenting Applications at the Patent Office and in managing them to a final issue; will draw up Assignments; will examine into the condition of Rejected Applications when desired to do so, and undertake the prosecution of such as may be considered patentable; and do whatever else is usually done by Patent Solicitors.

Address, P. O. Box 257, Washington, D.C. 7v12-3m

SHAW, San Francisco, care Mining and Scientific Press. 14v13-1m

CONNECTICUT

Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS..... \$12,000,000.

THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,
The Largest Amount Insured,
The Largest Surplus,

The Largest Business,
The Largest Income,

And as it obtains the LARGEST average rate of interest on its investments, and how bad, through its whole history, the LARGEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT of the premiums paid during the year ending 31st of January, 1886.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies to which Life Insurance is applicable, among which forms are—

Whole Life Policies, by a continued annual life premium.

Whole Life Policies, by TEN annual premiums.

Endowment Policies, by a continued annual premium.

Endowment Policies, by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give a note in part payment of the premium, but may, if preferred, pay the first four premiums in cash after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums one-half. When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be applied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

Accidental Insurance!

The Accidental Insurance Company
OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF
all kinds, and death resulting from accident.

In case death does not result from the injury, the insured receives a weekly compensation as long as he is disabled (not to exceed twenty-six weeks).

ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in terms of the Annual rate, as follows:

1 month, 2-10.	4 months, 5-10.
2 " 3-10.	5 " 6-10.
3 " 4-10.	6 " 7-10.

GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices through the country.

They make Insurance for \$6,000, and \$25 per week compensation, against Accidents of every description, Traveling or otherwise; good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident" to the Public conveyance in which the assured may at the time be traveling; but they are GENERAL ACCIDENT TICKETS.

SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and other Ports. Rates varying with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with Wm. Barnes, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

INDUCEMENTS.

The rates of Premium are very low.

The Plan is so simple that any one can comprehend all its workings.

No MEDICAL EXAMINATION is required, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory use can be made of so small a sum.

For Policies or further information, apply to

And in accordance with law, and an order of the Board of
 Trustees, made on the eighth day of November, 1885, so
 many shares of each parcel of said stock as may be neces-
 sary, will be sold at public auction, at the auction rooms of
 Dunean & Co., No. 406 Montgomery street, San Francisco,
 Cal., on the thirty-first day of December, 1886, at the hour
 of 12 o'clock M. of said day, to pay said delinquent assess-
 ment thereon, together with costs of advertising and ex-
 penses of sale.

A. DE SENAILHAC, Secretary.

Office, 606 Montgomery street, San Francisco. del15

Siskiyou Mining Company—Location of Works:
 Middle Fork of Humboldt Creek, in the County of Siski-
 you, State of California.

Notice is hereby given, that at a meeting of the Board of
 Trustees of said Company, held on the tenth day of
 December, 1886, an assessment of five (\$5) dollars per
 share was levied upon the capital stock of said Company,
 payable immediately, in United States gold and silver

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Müller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been ground. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior." As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's laches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to KNAPP & GRANT, San Francisco.

Leffel's Lever Jacks.

For railroads, cars, or wagons; Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by KNAPP & GRANT, San Francisco, 121 1/2 St.

HUNTER'S IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety percent of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address ANDREW HUNTER, Inventor, San Francisco. 22v13-3m

The Hansbrow Pumps

All Sizes, for any Purpose.

FOR SALE BY

LOCKE & MONTAGUE.

112 and 114 Battery Street,

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere. The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,
416 Market Street, San Francisco. 19v12

Hunt's California Pump

Has all the advantages of any other Pump, is one third cheaper and more durable, will draft water as deep and force as high as any others, is not liable to get out of order, and is easily repaired by any one.

All these Pumps are fitted to work by hand if desired.

These Pumps have given good satisfaction to all who have used them during the last three years. Good judges have examined them to be the cheapest and best Pumps in use.

Manufactured at Hunt's Windmill Factory, 28 Second Street and 110 Jessie Street.

Also, Tread Horse Pumps, Pumping Frames for Irrigating, Saw Frames, Sweep Horse Pumps and Frames, all in one frame, the horse to travel around the frame.

PRICES OF HUNT'S CALIFORNIA PUMPS.

E. O. HUNT,
21v13f 28 Second and 110 Jessie streets, San Francisco.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the greatest number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the
PACIFIC FOUNDRY,
San Francisco. 1v1

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the Mining and Scientific Press, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner. LEWIS & CO. Patent Solicitors
San Francisco, June, 1866.

Brevities.

NINETY men are employed on the Dry Dock. The grading of the site is nearly finished.

HOD-CARRYING is now being done by steam. See the building going up at the corner of Bush and Sansome streets.

THE DENVER NEWS of Nov. 20th, reports one hundred and six meteors as having been seen at that point during the hours of 12 midnight, and 5.15 of that morning.

THE appreciation of art in San Francisco is so meager that certain artists of undoubted merit are without ordinary comforts, although not perhaps actually starving.

CORN-STALK PAPER is now made extensively in Austria. The Austrian Consul at New York has specimens of more than 300 varieties of paper made from this fiber.

BREASTADT's new painting of Yo Semite is so large that a scaffolding is necessary to enable him to work at the upper part. It is expected to be a grand affair.

THE lectures of Professor Agassiz on the Amazon, drew crowds of New Yorkers. Even that region, so near the equator, was once an ice field. He finds there plenty of proof of the truth of his glacial theory.

A MOSTER CUTTLE FISH, sixteen feet from end to end, is among a collection of curiosities for the Smithsonian Institute, just arrived in our harbor from Russian America. It is preserved in alcohol.

A GORGEOUS cashmere shawl, made for the Queen of Oude just before the Sepoy revolt, will be seen at the Great Exposition in Paris. It is of extraordinary fineness, and was ten years in the making.

THE steamer Great Republic, for the line between San Francisco and China, was launched at Greenpoint, New York, on Nov. 7th. She is the largest wooden steamer ever built in the United States.

THE Indians in Idaho are committing greater depredations than ever. Three or four raids have been made by them, resulting in several deaths and the destruction of a large amount of property.

TWELVE THOUSAND tons of salt are brought every year to San Francisco from Curmen Island, in the Gulf of California. It is 90 per cent. pure chloride of sodium. A conveniently shaped basin furnishes the supply which is constantly renewed by evaporation.

THE new city market on Pine and California streets, between Kearny and Montgomery, will, it is expected, be ready for use by the first of April next. The stalls in that portion devoted to the sale of fish, will be of white California marble; and will have tanks for live fish. The total cost of land and building will be \$250,000.

INTERESTING PETROLEUM DEPOSIT IN KENTUCKY.—There appears to be a tract of country in the neighborhood of Paint Lick Creek, Ky., very much resembling some of the petroleum deposits in Santa Barbara and Tulare counties in this State. Petroleum issues in numerous places from the base of the cliffs and hooks of loose sand. In many places it will collect in such holes as may be dug in the earth. The banks and sandy bottom of Paint Lick Creek are saturated with it for a considerable distance so that when the sand is stirred up, the oil flows off as a shining scum upon the surface of the water. Booms have been placed across the creek, in places where the water is comparatively quiet, and the oil caught thereby, and gathered up and barreled for sale. It collects in some places and forms slimy bogs and muck-heaps. In one place a black reservoir of tar-like oil occupies the center of a gently sloping bog, and is always kept full from an oil spring near its upper limit.

NEW METHOD OF DETERMINING WHETHER A MINE IS RICH.—The following simple rule has been found, by the Montana Post, to be almost infallible; and is cheerfully offered for the benefit of the public:

"We consult the records of the courts. If we discover that a lawsuit is or has been connected with the lode, we have no hesitation in asserting that it is valuable property. We never heard of any conflict about the ownership or discovery of a worthless claim."

This is too true—as well in California and Nevada as in Montana.

PROF. AGASSIZ used 2,500 gallons of alcohol solely in preserving specimens, during ten months of his travels in South America.

TWO THOUSAND MEN are now at work on the Pacific Railroad, on the Truckee River, and near Crystal Peak.

Fossils in New York.—The New York Tribune has the subjoined despatch from Troy, under date of Nov. 9th:

About a month since, during the excavations of a peat bed in Cohoes for the foundation of a new mill, now in the course of erection by the Harmony Manufacturing Company, the jaw-bone of a mastodon was discovered about thirty feet below the surface of the earth. This relic of the antediluvian age is of immense proportions, and has attracted the attention of geologists and students of nature from all parts of the country—letters of inquiry respecting it and personal examination having been made by some of the most distinguished savans of the United States. But yesterday even this wonderful discovery was eclipsed by the excavation of still further fossiliferous remains, which complete nearly the bones or framework of the mastodon. Eighty-five feet below the earth's surface, and about fifty feet below the place of the original discovery, the workmen yesterday came upon the remaining bones, consisting as follows: Two tusks, back-bone, the upper jaw and cranium, a number of the ribs, the hip bones, shoulder blades and the bones of the hind legs. The tusks were each nearly six feet long and about nine inches in diameter. One of them, upon exposing to the light, crumbled to pieces like clay, revealing that substance in appearance and texture. The ribs, of which there were fourteen found, are about four feet long, the largest being four feet nine inches. The upper jaw-bone is four feet nine inches long from the extremity of the mouth to the cranium, and across the forehead measures about three feet. So heavy is it that it was with difficulty four laborers could move the mass. The sockets in which originally were located the eyes of the monster are almost large enough to admit the head of a man. The hip-bone is five feet long, and weighs one hundred pounds; the shoulder blades measure two feet nine inches, and weigh about fifty pounds each. The bone of the leg at the knee-joint measures thirteen inches in diameter. The other fragments found are in harmonious proportion to those already mentioned. The structure will now be united in its several parts by means of wire, and thus a very accurate idea can be formed of the size and weight of the monster to which it belonged. After a separation of countless ages, probably, the several parts will be reunited.

In 1856, five highwaymen robbed S. D. Barstow of \$25,000 on Trinity Mountain. They were sent to State Prison, where they served out their ten years. A few days ago they visited the scene of the robbery, and it is supposed dug up the money then and there buried.

Machinery.
Brodie's Patented Improvements

FOR THE TREATMENT OF
Gold and Silver Ores.
BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:
No. 1—Or 4 inch Crusher, capable of crushing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour.....\$850
No. 3—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200
EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.
The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.
The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.
The following testimonials respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:
Rawhide Ranch, Tuolumne Co., Sept. 28, 1866.
JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.
Those infringing the patent rights to the above Improved Barrel are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.
A drawing, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.
BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations are afforded on application to the subscribers.
A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

THE PHILOSOPHY OF MARRIAGE, BEING FOUR IMPORTANT LECTURES ON FUNCTIONS AND DISORDERS of the Nervous System and Reproductive Organs, to be had by addressing and enclosing twenty-five cents, postage stamps, to Secretary PACIFIC MUSEUM OF ANATOMY, North Montgomery street, San Francisco. 18v13-ly
With the last number is an index to the whole volume, most useful and valuable to those who keep files of that paper.—[Shasta Courier.]

GREAT SPRINGS.—There is a spring in the center of the town of Huntsville, Alabama, from which is said to flow a stream of water large enough to float a 30-ton vessel. It is believed to be the largest spring in the world, and is an object of great interest to travelers.

There is said to be another large spring near Florence in the same State, which throws out a body of water, the volume of which has been estimated as high as 17,000 cubic feet per minute.

The Alabama springs may be all that is claimed for them; but there is a *very large* spring, not many days travel this side of Goose Lake, in the northern part of California, which, were it located in a level country, where its waters could collect in a quiet stream, would float quite as large a vessel as that of Huntsville. About sixteen years ago, we had the pleasure of camping for the night by the side of this California spring, and the noise of its waters, as they rushed therefrom and dashed, in their onward course, among the rocks, was like the roaring of a cataract. We took no measurement of their volume, but, judging from recollection, should suppose the discharge could not be less than 15,000 cubic feet per minute, perhaps more. If any of our readers have ever visited that spring, and have examined it with sufficient care to give an intelligent description of it, we should be pleased to hear from them. It certainly forms one of the natural wonders of California. It is probably the outlet of some subterranean river.

COAL OIL PRODUCTS.—The products from the distillation of crude coal oil are as follows: At a temperature of 70° Fah. the product is "chimogene;" at 120°, "rhigoline;" at 170°, "gasoline;" at 250°, "naptha;" at 300°, "heuzine;" at 400°, "light kerosene;" at 500°, "kerosene;" at 600°, "heavy kerosene;" at 700°, solid "paraffine." The mass remaining in the retort after it has stood for some time at 700°, is carbon and earthy matter, similar in its character to coke. This residue usually forms a most excellent filtering material. The refuse of shale from which oil and paraffine has been distilled is said to be the most perfect filtering material known. A bottle of the filthiest water from the Edinburgh (Scotland) sewerage, after being filtered through this material is said to have been submitted to an eminent chemist for analysis, at the same time with another bottle of the purest Crowley water (a very pure aqueduct water used in that city). The chemist was unable to determine which was the aqueduct water.

MARBLE IN TUOLUMNE COUNTY.—An extensive quarry of marble, of a superior quality, is situated near Columbia. It is owned by a San Francisco resident. The editor of the *Citizen* recently visited the works, and thus discourses upon them:

"The mill is situated upon a mountain of marble. A derrick is so arranged that two men can with ease raise from the quarry and place on the ways a block weighing twelve tons. An over-shot wheel, twenty-four feet in diameter, furnishes power to move the saws. From twenty to thirty tons are taken from the quarry and prepared for market every month. One block has been got out and dressed in this mill which weighed 13,000 pounds, but had to be sawn in two to be transported."

TESTINO GRANITE.—In proving the value of granite for building purposes, its solubility is something that is often overlooked; and yet it is a test which it is necessary to take into account. An indifferent granite will often lose 0.25 per cent. of its weight in pure water alone; while in hydrochloric acid it may lose as high as five per cent. Such granite should never be used for building purposes.

THE SUTRO TUNNEL AND THE SPECULATORS. The *Times*, of this city, says, that although the speculators would derive the first benefit from the actual commencement, with good prospects, of the Suto Tunnel, yet the public would be the gainers afterwards, inasmuch as the stock would soon come to be considered a safe, permanent investment, and would have a fixed value. Panics would then be out of the question.

TO MINERS, MILLWRIGHTS AND FARMERS.

We beg leave to call your especial attention to the

EXCELSIOR

Double-Acting Suction and Force Pump.

Hooker's Patent, Aug. 15, 1865.

This Double-Acting Suction and Force Pump, the best in use, is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and is warranted to furnish more water, than any other Pump of equal caliber. It has Puppet Valves, faced with vulcanized rubber, which cannot be wrongly placed in the Pump. The valves can be changed, without disconnecting air-chamber, suction or discharge pipes.

In case of necessity, the Pump can be run at any high rate of speed, and will furnish water proportionately. The Excelsior Pump is equally adapted to use for surface and deep wells or shafts. It can be run by windmill or horse power for irrigating purposes; also by hand or steam power on steamers and ships. For domestic use, no better Pump can be found.

Fig. 3.

Fig. 3 represents a Hand Pump, which works very easy, and with even power. Fig. 4 is a 6-inch Mining Pump, showing adjustable bonnet of the valve chest.

For Circulars, or further particulars, inquire of or address J. W. BRITTON & CO., Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or CUSHING & CO., Props., San Francisco.

Endorsement by the Miners' State Convention

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.

A VALUABLE AND USEFUL JOURNAL—ESTABLISHED IN 1860.

PRINTING OF EVERY VARIETY CORRECTLY AND PROMPTLY DONE.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should hear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

New Mining Laws of California and Nevada

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & CO., Patent Agents, San Francisco, May 1st, 1866.

THE PRESS is a large, sixteen page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—N.Y. County News.

MILLER'S ADJUSTABLE TEETH FOR CIRCULAR SAWS.

This is a recent California invention of much promise, for which letters patent were granted at Washington in October last. It has already been mentioned in our journal, but without illustration. This we now give, with the inventor's claims and description, as follows:

"Several plans for attaching teeth to saw plates have been devised and put in use, but with little or no success; for the following reasons; First, all insertable teeth heretofore used require a thicker plate to support them than do the solid teeth. And, secondly, what is saved in labor and files by the use of insertable teeth is absorbed in their purchase. For the above, and other reasons, insertable teeth

the necessary projection; then file them, and the damage is repaired.

Sixth—Should the saw be run in contact with an iron bolt, or like obstruction, the teeth would be turned back in their sockets, and thus protect the plate from injury.

Seventh—These saws remain exactly the same size, and never can get out of round nor balance.

Eighth—These improved teeth are elastic, which insures a perfect fit, and a uniform distension in their sockets under any degree of temperature.

Ninth—The form of these teeth, being round, admits of their being turned in a lathe, and duplicated with perfection. The sawyers have no forging nor fitting to do. An entire set of teeth may be inserted in from five to

a section of saw-plate, with one tooth inserted, and a socket, B, prepared to receive the tooth, A. The teeth are held firmly in position by friction in the V groove. The hole in the butt of the tooth is for the purpose of applying a lever to turn the tooth in the socket.

Two of those improved saws may be seen running, one in Samuel Braanan's mill at Calistoga Springs, California, and one in Capt. W. T. Laywartz's mill, at Port Ludlow, Washington Territory.

These saws will be guaranteed to the purchaser to be as represented in every particular. Works with improved grinding machinery, will be established in San Francisco, without delay, for the purpose of reducing saw plates now in use to the proper thickness, and inserting these adjustable teeth.

For further information in regard to the above, parties can address Joseph Stone, at San Francisco, Cal., who is agent for the Pacific coast, or Warren P. Miller, patentee, at New York city.

MILLER'S ADJUSTABLE TEETH FOR CIRCULAR SAWS.

are not much used except in connection with large saws, and it is asserted by practical saw makers, and not a few millmen and sawyers, that there is no economy in the use of insertable teeth as heretofore made and applied.

The accompanying engraving represents insertable teeth, constructed on an entirely new method—a plan in which is comprised a mechanical arrangement never before known. This principle, as applied to saw teeth, renders them absolutely perfect; nothing better can be produced, nor desired.

Saw teeth constructed on this improved plan possess the following advantages over any and all others:

First—The teeth, being nearly encompassed in the plate, are rendered immeasurably stronger than even solid teeth formed on the plate.

Second—For reason of their great stiffness laterally, these saws may be fully one-fourth less in thickness than solid teeth, and one-third less than other insertable teeth saws.

Third—Saw teeth constructed on this plan have more room for chips, as the throat being round, it is readily discharged; and consequently will take faster feed, will run with fifty per cent. less power, and make ten per cent. more inch boards from a log than other insertable teeth saws.

Fourth—These teeth are self-attaching and adjustable in their sockets. No other saw teeth are.

Fifth—Should the point of one or more of these teeth become broken, by simply turning them forward in their sockets they will attain

tea minutes, depending on the number of teeth and size of the saw.

Tenth—Ninety-five per cent. of the labor and files required to keep a solid tooth saw in order, or fifty per cent. as compared with other insertable teeth saws, will be saved by the use of these adjustable teeth.

Eleventh—Less skill is required to insert these teeth and keep them in order. The periphery of the teeth is a guide for filing them. A tooth, if broken, may be removed and another inserted in twenty seconds, by any person having once witnessed the operation; therefore, the expenso of duplicate saws is avoided.

Twelfth—These teeth cannot, by any means, be thrown out of their sockets; hence the operatives are secure from injury.

Thirteenth—These adjustable teeth will do three times more work before being worn out than any other insertable teeth, for the reason that the teeth remaining in order need not be reduced to accommodate those that may be dull or broken.

Fourteenth—These teeth are like applicable to circular saws of every size and for all purposes; are peculiarly adapted for cutting-off saws, as well as for splitting.

All the above enumerated advantages, and many more, are fully secured by the use of these Circular Self-attaching and Adjustable Teeth.

In the accompanying cut, letter C represents

THE PARIS EXPOSITION.—Professor Blake is now on a tour through the northern mines for the purpose of collecting specimens of minerals for the Great Exposition. He will visit Nevada, Sierra, Plumas, and perhaps other counties. The Finance Committee appointed to take into consideration the amount of money which will be necessary for carrying out the object of the appointment of a State Commissioner, have reported that the sum of \$4,000 will be absolutely necessary to cover the extra cost of transportation, beyond the free services tendered by the several transportation companies, and the storage and packing of the articles to be exhibited; and that the further sum of \$1,000 should be raised for printing and publishing information concerning California and her resources. An appeal is therefore made to the citizens of the State for a fund of \$5,000. The committee conclude their appeal as follows:

"Duty to our own interests and a just regard for the credit of the State demands a prompt contribution from all parts of California, and believing that the importance of the object is well understood by our people, the Committee confidently expect that this appeal will meet a prompt and hearty response.

The Committees solicit donations from all interested, and in addition, will devise means to have our citizens called upon for subscriptions.

I. N. HOAG.

THE MINERALS OF COLORADO.—J. Alden Smith, of Trail Creek, Colorado, has compiled a catalogue of the various mineral species which he has found in that Territory during the three years past. It comprises some 150 species, with the localities where found. It appears in the columns of the *Colorado Journal*, and will furnish the matter for a chapter in the book entitled "The Mines in Colorado," to be published soon by that paper.

THE CONTRA COSTA GAZETTE recently saw seven pears, which together weighed just twenty pounds: They were from the orchard of A. W. Hammitt.

[Reported for the Mining and Scientific Press.]

California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY, December 17, 1866.

President in the chair.

Twelve members present.

Minutes of previous meeting read and approved.

Dr. F. Hansen was elected a resident member.

Messrs. G. O. Whitney and Charles D. Cleveland were proposed for resident membership.

Donations to Cabinet.—Skeleton of a heaver, presented by Captain Pauloff of Kodiak.

Donations to Library.—Ninety-seven volumes and pamphlets upon the various natural sciences, presented by Dr. J. G. Cooper.

Special Committee on Rooms reported that the Academy could obtain suitable accommodation in the new building southeast corner of Pine and Montgomery streets. On motion, the report of the Committee was accepted.

Special Committee on Lectures, Essays, etc., requested further time to report, which was granted.

The thanks of the Academy were tendered to Dr. Cooper for his donation.

Adjourned until Monday, January 7th, 1867, when the Academy will meet in the rooms in McCreary's building, southeast corner of Pine and Montgomery streets.

A NEW BLAST BLOWER.—At the Globe Iron Foundry, Stockton, says the *Independent*, the furnace has a blower of peculiar construction. It has a cylinder of an oblong shape, twenty-four inches in diameter, and four feet long. The inside has two revolving pistons, made like the figure 8, and gives a power of wind at only 180 revolutions per minute, that causes iron to melt in a few minutes. It does not require over one-fourth of the power of the common blower, and at the same time is not liable to get out of repair. The machine was gotten up by the proprietors of the Globe Foundry, and is the only one of the kind on the Pacific coast. As a matter of course, it is needless to state that the proprietors of a foundry, of which Stockton has a right to be proud, are furnishing machinery of every sort in great quantity; also a new plow, which we will mention at another time. The latter, we believe, is the invention of Mr. Blaks and Mr. Baxter.

GASTON'S SCREW GRINDER AND AMALGAMATOR.—This new machine is now in running order at the Pacific Iron Works, First street, where persons interested in mining machinery are invited to witness its operations daily, between the hours of 10 and 11 A. M.

Concentration of Sulphurets.

EDITORS PRESS:—In a late number of your paper, you mention a contrivance for saving sulphurets, by means of a belt of canvas passing over rollers, and constituting a so-called revolving sluice, or self-washing blanket. As to the patentability of the invention, I must say I think it doubtful; but I have no doubt of its utility, and have more than once recommended its use. I suggest that the edges of the belt should be bound with stout rope, sewed on after the manner of the bolt-rope of a sail. This, while perfectly flexible, will form sufficient siding for the "sluice," and, at the same time, add greatly to its strength and durability.

The problem of saving sulphurets is, under practical conditions, one of scarcely less difficulty than importance, and is worthy the careful attention of inventors. In a former letter to the Press, I said that the perfect separation of sulphurets, by means of water, can only be attained when the matter operated on is of nearly uniform fineness, the effect of greater specific gravity being counteracted by that of size and shape.

In order to perceive clearly the truth of a principle, it is well to suppose an extreme case. It would be difficult to save fine gold or sulphurets in a current of water which would remove a brick. Gold is nineteen times as heavy as water, while quartz is but, at most, three times as heavy; yet, every miner knows that small, thin scales of gold will be carried away by the water in the sluice, while grains of sand remain.

There are two reasons for this, independently of that peculiar tendency of metals, which is also observed in sulphurets, to repel water from their surfaces, by which they are often enabled to float. These reasons are: Firstly, among bodies of similar form, but of different sizes, the lesser have a larger surface, in proportion to their mass, than the greater; and, secondly, among bodies of the same size or mass, but differing in form, those which approach nearest to the sphere have the least surface, for the sphere is the form which contains the greatest possible quantity with the least possible surface. The solid contents of bodies increase or decrease as the cubes of their similar measurements; but their surfaces as the squares of those measurements.

Sulphurets, though heavier than quartz, are much lighter than gold, consequently, other things being equal, are much more easily washed away; and, being more friable than the quartz, are liable to be reduced finer by crushing or grinding; whilst they are also more liable to break into angular or tabular forms, owing to their crystalline structure. The specific gravities of different sulphurets are—iron pyrites 5; copper pyrites, from 4.1 to 4.3; galena, 7.3 to 7.7; sulphurets of antimony, 4.5; sulphuret of silver, 7.6. The specific gravity of quartz is about 2.3. This difference, already not very great, is still further reduced by the adherence of particles of sulphuret to the grains of quartz. The resistance to the passage through water of bodies, such as those under consideration, is mainly governed by the amount of surface, and in a less degree, by their form; and it matters not, for any present purpose, whether it is the water which moves, and the sulphurets which are desired to stay behind while the sand is carried off, or the sulphurets and sand which move through a body of still water, in their passage to the bottom, which it is desired that the former should reach first. In either case, a great difference of size will, more or less, be found to counteract the desired effect. Two cannon balls, of different sizes, dropped simultaneously from the top of a high tower, and falling through air, will not reach the ground at the same time, Galileo to the contrary notwithstanding. This could only occur in a vacuum.

The first step towards successful invention, is a clear perception of the end to be attained,

and of the obstacles to its attainment. In that class of machines to which rockers, "frames," some varieties of percussion tables, and the "revolving sluice" belong, the property of sulphurets alluded to, of breaking in angular and scale forms, is called to the aid of specific gravity to effect the separation. In them the matter is exposed to the action of a thin sheet of water flowing upon an inclined plane. It is not suspended in the water, but is in contact with the solid surface beneath. Hence results a rolling motion of the particles and the roller, and within certain limits, larger ones being more amenable to the action of the current, are more readily removed than the scales and angular pieces, which tend to cling, as it were, to the bottom. Yet, even here, too, great inequality of size is fatal to a suitable adjustment of the current of water, which, if strong enough to remove the larger grains of sand, will also carry away, in suspension, the smaller particles of sulphuret. Moreover, all these machines work slowly, and some of them require much hand-labor, which, though admissible in Europe or Mexico, is almost fatal to their utility here.

The foregoing considerations point to the necessity for two processes of separation; the first, referring to size, the second to specific gravity. To effect the former, I will suggest two methods, both simple and not very costly. The crushed ore or tailings, wet or dry, may be sifted by means of a revolving cylindrical sieve or bolt, having coarser meshes toward the lower end, so as to discharge the different grades into separate troughs, from which it would pass to suitably adjusted concentrators. To avoid the wear of the fine wire gauze, several concentric sieves may be combined on one axis, each of which would discharge its appropriate grade of material.

Another plan, requiring less expense for machinery, but more for labor, is to allow the tailings to flow through a set of gradually widening boxes; in the first and narrowest of which the coarser matter will accumulate, and the finer in successive boxes, as the force of the current lessens from their increased width. In this way the very finest powder may be saved, and, at suitable periods, the contents of the boxes may be removed, and subjected to concentration for their sulphurets. As to the machine to be used for this purpose, this article is not an advertisement of any one in particular. I leave every man to choose for himself. I may, however, be permitted to say that, so far, I prefer the circular shaking table, with central discharge, of which there are several varieties in the market, all, however, essentially identical with the English "sludge dressing machine," and of which, I will further say, I think their efficiency is more dependent upon a due regard to conditions, than upon minor peculiarities of construction; and, indeed, I think the same may be said of many of the grinding and amalgamating machines in use.

C. H. AARON.

[Written for the Mining and Scientific Press.]

The Portland (Oregon) Iron Works.

MESSRS. EDITORS:—Some account of the "Oregon Iron Company's Works," at Oswego, Oregon, may be thought deserving a place in your columns. W. S. Ladd, Esq., of Portland, is President of the company, and among its shareholders are numbered some of our best business men, as well as many such in San Francisco and New York. The capital stock is \$500,000.

This is the first smelting furnace erected on the Pacific coast, and is situated at Oswego, on the left bank of the Willamette river, eight miles south of Portland, and in the heart of a large iron ore district. The beds of ore which are already prospected, and sufficiently developed to ascertain, approximately, their amount, contain at least two hundred and fifty thousand (250,000) tons, and are from three-fourths of a mile to two miles distant from the furnace. The lands upon which the ore is found in large quantities, is contracted to the company, and is contiguous to the furnace property.

The quality of ore is approximately the same throughout the entire district around the furnace, and is found under the same geological conditions on a lava bedrock, which overlies the basalt, and is itself covered with detritus from the higher basaltic cliffs, and by gravel, clay and sand. The beds (not veins) are irregular in shape and depth; generally inclined at an angle of eight or ten degrees, and seem to have been deposited from solution in the irregular depressions of the lava. No iron has been found except underlain by this lava—a soft and porous rock, easily worked by pick and shovel. The stripping varies from a few inches to ten

and twelve feet; no drifting or timbering will, therefore, be necessary; but the working of the mine will be by open cuts. The greatest thickness yet found in the beds is about two feet; though beds are known of probably not less than thirty feet in close proximity to those most developed.

The analysis by Messrs. Kellogg and Heuston, of San Francisco, shows the ore to be a hydrated sesquioxide; it is as follows:

Sesquioxide of Iron.....	77.66 per cent.
Alumina.....	11.16 "
Insoluble Silica.....	11.08 "
Sulphur and Phosphorus.....	0.10 "

Total.....100.00 per cent.

Specific gravity 4.25, yielding 54.37 per cent. of iron.

The company are building a furnace (nearly completed) thirty-two feet in height, with nine feet diameter of boshes, capable of smelting 3,500 tons of pig iron per annum, with charcoal fuel, and hot blast of two pounds per square inch pressure. The masonry is of basaltic rock, massive, and reflects great credit on its builder, Mr. George D. Wilbur, of Sharon, Connecticut. The arrangement of coal sheds, coal yards, casting house, blast house, dam and flume, and all other requisites, are of the most convenient and substantial character; and the whole establishment will compare most favorably in every respect with the best Connecticut blast furnaces, after which this one has been modeled.

Charcoal will be made on the company's land, and the hills now resound with the chopping and blows of scores of woodmen's axes, felling the large tracts of timber, preparatory for coaling next spring, as early as our wet climate will permit. The cost of the coal will not exceed Eastern prices, and so favorably are the ore beds situated, that \$1.50 per ton will cover the cost of mining and delivering the same at the furnace. Nature has so thoroughly oxydized and disintegrated the ore, and it is so free from admixture with earthy or other foreign ingredients, that little or no washing or roasting will be required to fit it for the furnace. Smelting operations will be commenced by July 1st, 1867.

GEORGE H. BELDEN,

Superintendent Oregon Iron Co.
Portland, Oregon, Nov. 30, '66.

[Written for the Mining and Scientific Press.]

The Use of Iron Sponge for the Reduction of Metallic Sulphides, Phosphides, and Antimonides.

BY DR. LANSZWEERT.

EDITORS PRESS:—In your issue of December 8th, under the heading of "Scientific Miscellany," an item appeared giving credit to M. Chenot for the use of "iron sponge" in the sulphuration and desulphuration of ores. In the American Journal of Mining of November 3d, there is a similar notice extracted from the American Journal of Applied Chemistry. In order to place the credit of the discovery of the use of iron sponge for the above purposes where it belongs, and to enable your readers to render "unto Caesar the things that are Caesar's," I have taken the liberty to send you the following communication, detailing the first discovery and giving a complete description of the above process, which may prove of some practical use to our California metallurgists.

This process was patented on the 29th of January, 1859, in Belgium, by Messrs. De Bronac and Derherypoo. The treatment of metallic sulphides, phosphides and antimonides, is based on the principle of the energetic action of spongy iron in its reactions. Iron sponge is the result of the reduction of iron ores (oxyds, carbonates and hydrates) at a low temperature. The object of the reduction of these ores being the liberation of a gaseous body (oxygen) from a solid body (the iron); the latter being obtained in an extreme finely divided state—chemically, in its atomic state. In this state the iron possesses an avidity for new combinations, which it does not possess in its compact state. On these properties, Messrs. De Bronac and Derherypoo based their process for desulphurization. For a long time compact iron, or iron in small masses, has been used in the treatment of galena and sulphides of antimony as a desulphurizer and as a reducer. But its compactness in that form is a hindrance to the rapidity of its reaction; that action being merely in proportion to its surfaces in contact.

The energetic qualities of iron sponge, *i. e.* of iron in its nascent state, renders it thus more valuable, as a chemical agent; as in the

furnace treatment of galena, for example, they obtain by its use metallic lead at a temperature equal to that necessary for the formation of sulphide of iron; *i. e.* at a temperature inferior to that of the fusion of the gangues. According to its low price, and its extreme facility for division, it should be preferred, generally, in metallurgy. Thus, whenever, in metallurgical operations, it becomes necessary or useful to employ iron, in fragments, sponge iron should be preferred.

The avidity of iron sponge for new combinations, especially its avidity for sulphur, is the basis of this new process, giving the following results:

1. An avoidance of the necessity for preliminary roasting.
2. Rapid extraction and quick reduction, at a low temperature, of some metals from their sulphides.
3. A larger yield obtained than by ordinary processes.
4. A notable economy in the costs of treatment.

For the application of iron sponge to the treatment of metallic sulphides (arsenides, antimonides), reduce them first to powder and mix them with a proper proportion of iron sponge reduced to equal fineness. The quantity of sulphur in the sulphides (arsenic and antimony), must be in chemical proportions with the iron of the iron sponge, so as to form a sulphide of iron. These proportions vary according to the nature and character of ores. To prevent the oxydation of the iron sponge before its reaction with the sulphide (arsenide or antimonide), and to favor the combination of the mixture, the mass is compressed into bricks, which are covered by a layer of charcoal powder, in case they are to be treated in a reverberatory furnace.

The foregoing is applicable in general to all ores susceptible of being modified or reduced by iron. That point being admitted, we will now review the principal ores which may be treated by this process:

LEAD.—In the treatment of galena, the quantity of iron sponge is calculated so as to transform all the sulphur into sulphide of iron. The mixture, compressed into bricks, is treated in a vertical or in a reverberatory furnace. The gangue must not be scorified, and it is useless to increase the temperature above the point necessary for the formation of sulphide of iron. The reduced lead liquefies, leaves its gangues and the sulphide of iron, to run into a vessel prepared for its reception. The grains of metallic lead which may be left in the gangue, are easily obtained by a remelting of the same in the reverberatory furnace, or by pulverization and washing of the same. The desulphurization by iron sponge, is done directly on crude ores; neither oxyds nor sulphates of lead are produced, and consequently no lead fumes arise, and no loss occurs.

ANTIMONY.—What has been given for lead, is applicable for the sulphides of antimony, with the exception that a lesser quantity of iron sponge is used, to avoid the formation of antimonial iron. The result of the first operation gives the greatest part of pure metallic antimony, and a small proportion of sulphide of antimony mixed with sulphide of iron. This sulphide is used in the following operation, which is conducted in observing the same quantities. The difference of density of metallic antimony and its sulphide, facilitates their separation.

ZINC.—The same as galena. The blende is pulverized and mixed with a sufficient quantity of iron sponge, compressed and treated in the same way as calamine. In this operation the sulphur of the blende combines with the iron, and the zinc, liberated, is separated by volatilization.

COPPER.—All the sulphides, whatsoever they are, (copper pyrites, grey copper, black copper, etc.) are reduced to powder, without preliminary roastings. The desulphurization of all the metals contained in these ores, by iron sponge, must be done by the employment of a larger quantity of sponge iron than is necessary to the desulphurization of the copper alone; the excess of iron sponge being required to reduce the other sulphides present. After the fusion, which can be conducted in a vertical or reverberatory furnace, a metallic residue is obtained, composed partially of the copper and the other metals contained in the ore. This product is first crushed, then submitted to a roasting, which is the more easy, as its use is to simply oxydize the iron and copper, and to volatilize other metals (antimony, arsenic, etc.) if they are present. After this roasting, the mixture is treated in a blast or reverberatory furnace, with an excess of silica, to obtain silicate of iron and metallic copper.

Mechanical.

Alleged Important Discoveries in Coke and Steam.

At a late meeting of the "Iron Trade" (an Association of iron-masters) at Wolverhampton, England, Mr. F. W. Gerhard, of the Causeway Iron Works, of Wolverhampton, exhibited specimens of coke, produced by a new process, and entirely free from sulphur. Mr. G. asserts that by his process he can perfectly desulphurize large and small coal, at a cost not to exceed forty cents per ton! Ironstone can also be desulphurized by the same process; [and if ironstone, why not all kinds of ores?] He further states that ordinary ironstone, thus desulphurized and smelted with pure coke of his preparation, is equal to hematite iron; which owes its great value to the fact that it contains but a trace of sulphur, and can therefore be readily converted, by the Bessemer process, directly into steel, which result cannot be obtained from iron ores containing sulphur.

As a further evidence of the value of his process over that ordinarily employed, for producing coke for iron furnaces, Mr. Gerhard stated that out of thirty or forty samples, which he had obtained from different parts of Great Britain, not one of them proved to be free from sulphur, when submitted to the same test which failed to show the presence of that substance in coke of his manufacture—consequently such coke could not make as good iron as his. As sulphur is the greatest hindrance in the way of producing good iron, he holds that a most important result is thus placed within the reach of every iron-master who will adopt this simple and inexpensive method of desulphurization, previous to smelting, which he has discovered.

Mr. Gerhard is a metallurgist, well known to the Association referred to, and a member thereof. He is represented to have been engaged, for upwards of two years, in experimenting on South Staffordshire iron and its production, with the view to perfecting his discovery. The report of this meeting is given in the *Birmingham Journal*, the editor of which communicates the facts as presented to the meeting, leaving it to practical men to judge of their accuracy and the worth of the discovery. The *modus operandi* of the process is not given. If the discovery is a genuine one, and one which can be economically applied in California, it may have a special value in this State; as most of the California coals contain a large per centage of sulphur, which renders them unsuitable for metallurgical purposes, as they come from the mine.

DISCOVERY IN STEAM.

Mr. Gerhard, however, does not stop here. He believes he has also discovered a method whereby any sea-going vessel may dispense with fully one-half the amount of coal usually employed. He would use the same kind of coal as now employed; but he claims that by what he terms another "simple and inexpensive" process, he can obtain the same power out of five tons of coal, for instance, as is now derived from ten tons. His invention, he says, is applicable to every description of steam engine now in use, and is especially adapted to marine boilers. The *Journal* says that Mr. Gerhard is neither commercially manufacturing the coke he exhibited, nor has he patented the desulphurizing process by which it is produced, although he has drawn up the provisional specification; whilst the invention he claims to have found out for so greatly diminishing the fuel requirements of steam vessels is equally unpatented. Mr. Gerhard had a portable apparatus by which he exhibited to the Association this last mentioned invention in operation. The editor of the *Journal* aforesaid, adds that "The importance of any practicable method of so vastly economizing fuel in the generation of steam it would be impossible to over-rate; but whether or not Mr. Gerhard has invented such a method, we leave others to decide. We simply draw attention to the claims that he sets up."

THE LARGEST RAILROAD DEPOT in the world has recently been built at Cleveland, Ohio. It is 603 feet in length by 180 in breadth, and covers an area of more than two and a half acres. The building is one of considerable architectural beauty. The front is ornamented with marble busts of Lincoln, Grant, and other men of note.

REPAIRING CRACKED CIRCULAR SAWS.—Mr.

Wm. D. Rinehart, of West Manchester, Pa., communicates to the *Scientific American* the following plan for mending circular saws: First drill at the end of the crack a small hole one-tenth of an inch diameter; if the crack is more than three inches in length, then drill two holes two inches from the edge of the saw, and one-tenth of an inch from the crack, exactly opposite each other; then countersink the holes on both sides of the saw; cut through from one hole to the other with a thin file, the thickness of the file being less than the diameter of the holes; fit a piece of iron into a hole long enough to rivet on each side of the saw, filling the countersinks; then file even with the surface of the saw. A crack may be stopped in any kind of metal by drilling a hole at the end of the crack. The rivet proposed for the saw prevents the saw shearing or leaving a straight line. Square holes or dovetails would insure the saw cracking farther, as the strain on the saw will start cracks in the angles of the openings.

SPECIAL STEAM MACHINERY appears to be coming into very general use—in which the steam engine forms an intrinsic part, and not a mere adjunct or motor of the machine which it drives. For many purposes it appears to be much preferable to the intermediate use of power from shafting. Of this class of machines we may especially instance the steam hammer. Wood-splitting machines are also always driven in this manner. Several designs have been devised for the direct application of steam in this manner, to stamps for crushing quartz, wherein much economy in the use of power is claimed. The *American Artisan*, of July 4th last, gave an illustrated description of such a mill, which, with the engine, occupied a horizontal area of only six square feet; yet possessed the capacity of reducing thirty tons of quartz each twenty-four hours.

J. F. DUNLAP's new ball and cartridge has found favor with the Government. An order has been issued for the manufacture of a large quantity. It is said that when tested on even terms with the Enfield ball, it penetrated fourteen inches of solid plank, while the Enfield penetrated only seven inches. It ignites simultaneously in front, center and rear. It is pointed at both ends, does not whiz, and cannot strike sidewise.

A NEW ALLOY FOR BEARING-METAL.—Mr. W. C. Cambridge, of Bristol, England, has taken out a patent for the United Kingdom, for the composition of a new alloy, designed to take the place of Babbitt metal. This alloy appears to consist of iron and tin, and is made as follows: Take iron turnings 30 lbs., hurs or punchings of boiler plate 10 lbs., tin plate scraps 10 lbs., pure block tin 1 lb., place the same in a crucible with 2 lbs. common salt, 1½ lbs. fine white sand, and 1 lb. charcoal dust—melt and run into moulds of the required form.

CORROSION OF IRON—STEAM BOILERS.—Some corrosive waters not only waste and indent the surface of the boilers internally, but also destroy the vitality of the metal, so that the edge of the overlap may be cut away with a few slight blows with the hammer, and the rivet heads knocked off with a hand-chisel only, and easily pulverized. This fact shows the importance of carefully and frequently testing corroded rivet heads with a hammer.

A MAMMOTH CASTING was lately made at the Charlestown, Mass., Navy Yard; it was about one-half of the bed of a planer, the whole machine destined to weigh about 195 tons. The section cast will weigh thirty-nine tons when cleaned. The iron was from the machinery of the old United States steamer *Richmond*. Two months were required to make the mold, forty-one tons of metal were used, and eight days elapsed before this, the largest casting ever made in New England, became cool.

NORWEGIAN snow-shoes are in general use in Meadow Lake. They are from eight to twelve feet in length.

Scientific Miscellany.

NEW KNIFE FOR MEDICAL PURPOSES.—A French physician has taken advantage of the well known electrical characteristics of platinum to construct from it a most valuable knife for medical purposes, the use and philosophy of which may be stated as follows: The blade of the knife consists of platinum, and is placed within the circuit of a galvanic battery, while the handle is insulated. Platinum, it is well known, may, by aid of galvanism, be heated to any required temperature. Under ordinary circumstances, this metal is not suited for cutting, but it appears to be highly efficient for such purposes when a sufficiently powerful electric current is passing through it. The effect thus produced depends on the temperature to which the blade is raised, which temperature is constantly within the control of the operator. When the temperature is raised to 1,100°, or dark redness, the cut made by the knife is bloodless—the knife producing cauterization as it is passed through the flesh. On the contrary, when the blade is raised to 2,700°, or red whiteness, it divides the tissues with extraordinary facility, while the blood flows freely. This latter phenomenon is caused by the liquids being placed in a spheroidal state, and, therefore, out of contact with the blade; hence, no cauterization can take place, and the blood must flow. The platinum blade, at this temperature, is just at the point of melting; which result would be accomplished by a slight increase in the force of the electric current. This is another beautiful instance of the application of science to useful purposes.

THE POLES IN MAGNETS.—Capt. Selwin, of the English Navy, has recently published a paper on "Some new arrangements of the Poles in Magnets," in which he said one phenomenon connected with magnets was, that there might be, and often was, a succession of north and south poles in a bar magnet. He described an experiment he had made with regard to the subject. A steel bar having been prepared, and hardened as usual, it was magnetized by any ordinary means—either by touch or an electric current. Then either at the center or at any other point of the bar, where it was desired that the two poles should eventually be in juxtaposition, and even in more than one place, the temper was taken out of the bar by a rod of heated metal, or by a blow-pipe, this operation separating the two magnets, though the needles were still respectively north and south.

INCREASE OF RAIN-FALL AFTER AN ELECTRIC DISCHARGE.—The idea is generally entertained, that the increase of the rain-fall which immediately follows an electrical discharge is the result of such discharge. Electricians, however, say that the electric discharge is the result and not the cause of the sudden condensation of the cloud into the rain drop; and that the condensation is due to the cloud coming into contact with an extremely cold and dry current of air.

THALLIUM GLASS.—M. Lamy finds that thallium is preferable to lead to replace potash. It communicates a yellow color to glass just as sodium gives a green coloration. Thallium glass, it is said, is denser and more refractive than potash glass, and the author believes such glass will be specially applicable for some certain optical purposes, and also for the manufacture of some artificial jewels. The best specimen was obtained within the following proportions:

Sand.....	300
Thallium.....	200
Pure carbonate of thallium.....	333

The mixture fused easily, and formed a perfect homogeneous mass, which had an agreeable and brilliant yellow tint. The density was 4.235, and the refraction index for the yellow ray was 1.71.

SPECIFIC GRAVITY OF MERCURY.—Dr. Bal-four Stewart has recently made at the Kew Observatory, England, some determinations of the specific gravity of mercury. At 60° F., he found it to be 13.569, as compared with water at the same temperature.

A CURIOUS FACT (?).—An Australian paper states as a fact, a curious circumstance said to be connected with deep mining, that from the hours of twelve at night till three in the morning the disturbing influences in the bowels of the earth manifest increased activity. At that time it is observed by miners that water falls from places where none is observable during the day. The volume of water is perceptibly increased, the atmosphere is charged with gases which often prevent the lights from burning, and small particles of earth and rock are observed to fall from the tops of the drives. Whether this phenomenon is to be attributed to the diurnal motion of the earth or other causes, it is worthy the attention of the curious. Have any of our California and Nevada miners noticed any such phenomena? If any one has done so, and if any one has watched carefully and failed to notice such phenomena, they will confer a favor by communicating to us the result of their observations.

A SYSTEM of telegraphing is now in operation in France, by which exact copies of the original messages are produced at the terminus of the lines, solely by mechanical means. The telegram is written on paper coated with a lead-colored, non-conducting surface. The ink employed changes every point touched by it to the opposite electrical character. Two pendulums at either end of the circuit swing in unison; the upper end of each is divided into many points. By this contrivance, the message being passed over these at one end, a current to correspond with the writing is sent, and a *fac simile* copy, on prepared paper held to the vibrating pendulum, is produced at the other extremity.

IMPROVEMENT IN ELECTRO-PLATING.—A Frenchman suggests an apparently successful plan for electro-plating, so as to secure at once a brilliant surface. He says that by adding to the silver and potassium bath a very small quantity of sulphuret of carbon, the deposit takes place with a perfect evenness, and results in the production of a highly brilliant surface on the object plated.

THE ties on the Union Pacific Railroad are of cotton wood, hnettized. A boiler one hundred feet in length and five feet in diameter, is filled with the ties and the air exhausted. A solution of chloride of zinc is then injected, which fills the pores of the wood, and renders it comparatively indestructible.

DANGER ATTENDANT ON THE PREPARATION OF POTASSIUM-ETHYL AND POTASSIUM-METHYL. In the preparation of the compounds of sodium with ethyl or methyl there is comparatively little to fear—at any rate, if moderate quantities only be prepared at one operation. But there is the greatest danger in preparing the potassium compounds. When the replacement of the zinc by the alkali metal proceeds briskly, there is a considerable rise of temperature both in the case of sodium and potassium. From the low temperature at which potassium fuses, it very easily happens that the potassium fuses, and when once this occurs, a most tremendous explosion is the immediate result.

RESPIRATION.—Two persons shut up in a room which measures ten feet square and ten feet high, will pass all its aerial contents through their lungs in twenty-four hours. One person inhales about twenty cubic feet of air each hour.

THE GOLD MEDAL of the London Society of Arts has this year been awarded to the venerable and indefatigable Professor Faraday, "for his discoveries of electricity, magnetism and chemistry, which in their application to the industries of the world, have so largely promoted arts, manufactures and commerce."

THE moisture deposited on the windows of the court-room of one of our Western cities was collected and analyzed, when it was found to be putrefying and decolorized permanganate of potassa, more deleterious to health than that obtained from deep mines and similar places.

AN Auckland journal speaks of a valuable discovery of bismuth in New Zealand. It is associated with copper, and by a novel process the two metals are economically separated.

WEEKLY STOCK CIRCULAR

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,
December 22, 1886.

MONEY MARKET.

During a period of more than a month past money has been quite plentiful and easy to the borrower, good mercantile paper being freely negotiated at 1 1/4 per cent. per month, and lately first-class securities were discounted at 1 1/4 per cent.; the rate, however, has been for the most part 1 1/4 per cent. per month. This condition of ease prevailed to a greater extent for mercantile requirements, and this class of names had the preference in the market and carried the bulk of the transactions. Real Estate wants are not so pressing at this season of the year, and are readily obtainable at reasonable rates. Outside loans and advances upon mining shares command higher rates—1 1/2 to 2 1/4 per cent.

The demands for Duties at this port from January 1st to December 19th, 1886, amounted to \$7,032,291.42, and the Internal Revenue collections in this city during the months of September and October aggregated \$1,585,994.16.

Transactions in Legal Tender Notes have been very limited during the past week, and the interruption of telegraphic communication with the East kept them at a very uniform price—72c buying, 72 1/2c selling.

CITY STOCKS.

This class of stocks have been inactive for some time past, and for the week just closed the record of sales is meager. San Francisco Gas Co. sold at \$63.75 @ 65; Spring Valley Water at \$60; and Steam Navigation at 64 1/2 per cent. Under the dissatisfaction now existing among local Insurance Companies in regard to the low rates charged by some in violation of the rules established by the Board of Underwriters, shares have been called in the Stock Exchange at a slight recession from former prices without effecting any sales.

MINING SHARE MARKET.

The slight inactivity apparent in the Share Market at the close of last week, has prevailed to some degree throughout the present, most shares, however, maintaining uniform prices.

The Suto Tunnel is now commanding the attention of all Constock claims, and in reference to this important work we have been allowed to extract the following from the forthcoming annual report of the President of the Empire Mill and Mining Company. He says: "No time should be lost in urging the completion of the work, as experience has shown that with the increased depth which our mines will have reached before the tunnel can possibly be completed, the expense of mining through our independent shafts will have become so large as to consume all, and more than all, the product. This result is therefore inevitable, that the Suto Tunnel, or some similar work, must be constructed, or the mines will have to be abandoned at a depth of 2,000 feet. Were that work constructed to-day, the expense to the companies mining through it under the terms of the contract already entered into, would not be more than fifty per cent. on present cost, and at the depth at which that tunnel will strike the ledge the difference would be immensely greater; perhaps not more than ten or twenty per cent. on the cost of working through an independent shaft. The total expense of constructing the Suto Tunnel is estimated at \$2,000,000. Eastern capitalists, I learn, have signified their willingness to advance most of the means necessary for its completion, only requiring that the thirty or thirty-five companies on the ledge shall give an earnest of their own faith and confidence in its success by becoming stockholders with them to the comparatively small amount of \$300,000."

HALE & NORCROSS.—No sales during the week; \$2,300 @ 2,500 bid per foot. The winze from the seventh level, on the west vein, is now down over thirty feet, and it is said the ore continues to be good.

SAVAGE—opened at \$2,060, receded to \$1,975, then sold at \$1,980, and closed yesterday at \$1,950. On the seventh station, breasting is discontinued for the present, as more ore is obtained from the upper levels of the mine than is now required. The drift from the Curtis shaft is connected with Winze No. 3, and is said to be in excellent ore. This winze, with the exception of a few feet at the top, carried a good quality of ore the entire depth. The seventh station drift is rapidly progressing to connect with the drift from the Curtis shaft, and is said to be in good ore. During the week ending December 15th the average yield of ore extracted was \$40.36 per ton.

YELLOW JACKET—attracted considerable attention, opening at \$1,200, b. 30, receding to \$1,115,

gradually advancing to \$1,270, falling to \$1,240, and closing at \$1,262.50. No report from the company's office in Virginia City.

CROWN POINT—was dealt in at \$1,150, then at \$1,100, advancing to \$1,175, and at the close sold at \$1,210. The east drift from the 400-foot level is in 250 feet, and it is said shows some metal in the large body of quartz lately encountered. During the week ending December 14th, 891 tons of ore were raised from the mine; previous week, 990 tons.

GOULD & CURRY—sold early in the week at \$730, receded to \$690, advanced to \$700, and closed yesterday at \$690. In the second station, north drift, it is said that very good indications of ore have lately been found. Work will soon be resumed on the shaft, which had been suspended for about six months. For want of a quorum, the annual meeting was adjourned to next Thursday, the 27th instant.

CHOLLAR-POTOSI—received more than usual attention, opening at \$229.50, gradually declining to \$210 @ 209, and closing at \$215. Nothing new from the mine. About 1,000 tons of ore have been sent to custom mills last week.

EMPIRE MILL—varied little from \$188 to \$192.50, closing yesterday at \$215. During the fiscal year ending December 1st, the receipts of this company amounted to \$486,778.78, and the disbursements for expenses, dividends, etc., to \$454,322.51, leaving a balance of \$32,456.27. The net profits of the year are stated at \$121,129, and upwards of 22,000 tons of ore were extracted from the mine during the fiscal term. An average of 80 tons of ore per day is taken from the 1st, 2d and 3d levels, and it is estimated that from 8,000 to 10,000 tons of ore are now in sight, which, with the ore mined, shows an available supply for six months to come, the reduction capacity of the company's works being about 2,000 tons per month. At the annual meeting on the 19th, the old Board of Trustees was re-elected. They passed a resolution to make a liberal subscription towards that desirable work—the Suto Tunnel.

The disbursements of this company during the fiscal year include the following items:

Due last annual report.....	\$ 14,329.17
Paid in dividends.....	32,440.00
For mining 3,900 tons of ore on hands.....	15,043.00
Imperial-Empire Shaft—as assets.....	25,941.11
Excess receipts—balance as above.....	32,456.27
Net earnings during the year.....	\$121,129.55

OPHIR—receded from \$196 to \$179, and closed yesterday at \$164. At the annual meeting of stock holders, on the 18th instant, the following Board of Trustees was elected: Edwin Martin, President; Wm. H. Osgood, Vice President; Wm. B. Johnston, Josse Holladay, John C. Clarke, Geo. Platt, and H. L. Coe—the two last named gentlemen in place of Messrs. Blanding and Davis, of the old Board, who resigned. Mr. Robert George was elected Secretary, in place of Thos. J. Lamb, who resigned a position he has so efficiently filled for the last five years. During the fiscal year ending December 1st, the Bullion returns of the company amounted to \$448,324.09; assessments and other receipts, \$211,637.83—total receipts, \$659,961.92. Among the items of disbursements during the year, we mention for mining \$246,826.28, and reduction \$134,085.35. The debt of the company amounts to \$58,685.20, including obligations maturing in January, February, March and April, 1887.

IMPERIAL—sold within a range of \$136 @ 141, closing at \$140....CONFIDENCE at \$75 @ 80....OVERMAN at \$16 @ 20, closing at \$16, seller 10....BULLION at \$12 @ 7.50....SIERRA NEVADA at \$4.50 @ 3....BELCHER closed at \$137.50.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$616,951.50.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1886.

By Mail.—THE MINING AND SCIENTIFIC PRESS will be sent by mail to any part of the civilized world. In case of removal, subscribers have only to inform us of the post-office address of their old and new location, and the paper will be sent accordingly.

Trades and Manufactures.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the Silver Mountain *Bulletin* of Dec. 8th: Mylett, Burke, Jardine and Smith, owners of the Del Monte claim, situated in Scandinavian Cañon, exhibited some fine looking ore taken from this claim. They are down about thirty feet, and are now cutting across the ledge in order to determine its thickness.

At last the machinery for completing the Washington mill has arrived, and as only a few days will be consumed in getting it in motion, the next announcement we hope to make will be a "silver brick" therefrom. The prospect of an immediate revival of business in our midst appears to have given every one new heart. The want of another mill before spring will be realized before thirty days, as the George Washington mine can at any time place thirty men at work advantageously in getting out ores.

From the *Miner* of Dec. 15th: Gen. Hall commenced operations for the Active Company this week by starting a shaft on the Constitution lode, just below town. We were shown yesterday some very fine specimens of ore taken from this shaft, now down only about five feet.

The ore which assayed \$2,160 per ton, two weeks since, was from the Leviathan. It is the largest well defined vein of such richness in Alpine.

Amador County—

From the *Ledger* of Dec. 15th: Workmen are busy at the Kearsarge mill, putting up Amble's sulphuret machinery. It will take a few weeks yet to complete the job, and then they will commence working rock from the Coney & Bigelow mine. At present the mill is crushing rock from the old Moore mine.

The Pioneer is now yielding more bountifully than at any former period. The deeper they go the richer the rock becomes—in fact, the mine seems to be running into a mass of valuable sulphurets. The mill, now that water is abundant, is kept running day and night.

A short time since we mentioned that a very rich deposit of ore had been found in the lower level of the Newton copper mine. The deposit, instead of being a mere "bunch," is proving to be an extensive mass, and even richer than at first reported.

The heavy timbers for the Atchison mill are now on the ground. The work is being pushed forward rapidly. Mr. Atchison left last Saturday for Sacramento, for the purpose of purchasing machinery for the mill, which is to be a twenty-stamp one.

Butte County—

The claim opened by Virginians, which we alluded to last week, is in Bangor, 16 miles from Marysville, and comprises 1,500 running feet. A shaft 72 feet has been sunk, and drifts run east and west. The pay streak was struck in the latter. It is found to be about 60 feet in width, and will average \$30 to the ton.

Calaveras County—

From the San Andreas *Register* of Dec. 15th: The late rains have caused a stir amongst the miners. Yesterday we noticed several at work in the gulches, and we hope, ere many days have past, to have the pleasure of making known in the world some "big strike."

Letter to same from Dutch Hill says: We are alive and kicking up this way. Times are extremely exciting in consequence of new and rich discoveries in Warren's Ranch, of placer diggings. They have found extensive diluvial deposits on the higher ridges in that vicinity, in fact, the prospects are equal to those of '49. F. Treat & Co. are extending their Table Mountain ditch to the new discoveries, and after the first rains we anticipate lively times.

From the *Chronicle* of the 15th Dec.: We were shown this week, by Mr. Wesson, some very rich specimens of gold-bearing sulphurets taken from his claim near Middle Bar. It needed no microscope to determine the auriferous particles. Wesson & Co. feel confident that by spring they will have developed a ledge of sufficient extent to warrant the erection of a mill. The rock, from the top to the bottom of their shaft, which has been sunk to a considerable depth, prospects finely.

El Dorado County—

From the Placerville *Herald* of December 12th: The Woodside mine, at Georgetown, still continues rich. On Wednesday last there was pounded out in a mortar, a canelo box full of quartz, which yielded \$3,000. Mr. Treadwell, of Ophir, who was present, brought over here, the same day, some very fine looking specimens from the mine. The vein is located entirely in slate, which is very seamy.

A communication from Placerville, December 18th, says: The quartz excitement still con-

tinues, and new discoveries are being made almost daily. The lead discovered a short time since at Poverty Point prospects very fine, and the company is at work sinking on and developing the claims.

Mud Springs correspondent of Placerville *Democrat* gives the following: "At the Bryant lead, two miles south of El Dorado, the owners are building hoisting works to prospect to a great depth. The Union lead, near Auburn City, is now in the hands of energetic men, who will soon have their hoisting works in operation. The DeWolf and Baker lead, on Mathenas Creek, is said to be promising. Col. Baker is negotiating with some capitalists to have this lead prospected some two or three hundred feet in depth. Jameson & Co. have recently sold their magnificent lead, on Deadman's Hollow, to a company who are about to sink a new shaft and erect machinery. Thomas Davidson has prospected his lead to a depth of one hundred and twenty-five feet. He will most likely build a mill on it the coming spring. The New York and El Dorado mill, on Loafer's Hollow, erected by Captain Woodworth, is said to be one of the finest mills in the State. The machinery is perfect. This company are sinking a deep shaft at present. The Sugar Loaf is now owned by a company who are able and willing to develop their lead."

Fresno County—

From the Mariposa *Gazette* of December 15th: Operations on the Buchanan Hollow copper mine have been suspended for about three weeks, but it is confidently stated that work will be resumed there next Monday. The mine is down about 140 feet, and shows a vein of copper four feet wide. The proceeds of the concern are over \$2,000 per month, but the working expenses are very heavy, and considerably in excess of the product. The great want here as elsewhere is capital to carry on the work on a scale commensurate to the magnitude of the undertaking.

Inyo County—

A letter to the *Alta* of December 14th, from Camp Independence, has these items: The Chrysolite mill has finally been completed, and is now in fine running order. This is a 20-stamp mill put up by a New York company at an expense of one hundred thousand dollars. At the Stephenson mine very excellent ore has been struck, at a depth of one hundred and thirty feet. Some of this ore assays nine hundred dollars to the ton. The Kearsarge mine is also improving as they go down. Some specimens which I have from this mine appear to contain about as much silver as rock. Silver Spent is also coming out fine, and will, no doubt, prove a valuable mine.

Mariposa County—

From the *Gazette* of Dec. 15th: In Hunter's Valley, work is in full progress on the La Victoire copper mine. The company have ten to twelve hands constantly employed and are down several hundred feet. Haskell's patent process for reducing the copper is used here successfully. The general prospects of this copper mine may be said to be good.

Prospects at Phillip's Flat are flattering. Barrett & Matthews are making good wages. Sutton & Co. have just started working by hydraulic power. Their ditch is excellent, and the water plentiful.

Douglas and Barrett at Gimisal are working on their pocket vein with favorable prospects. Carson & Co. are not doing anything just now, but will commence soon.

At the Pott's mine, one hundred and twenty-six ounces of amalgam were the result of two weeks run.

The Lafayette Company is now in active operation, and taking out some excellent rock. There is a 4-stamp mill near the mine. The company are satisfied that the mine ought to pay at the rate of \$50 to the ton, instead of its present yield of from \$25 to \$30. We understand that arrangements are being made to sell the mines to parties in San Francisco.

From Coulterville correspondence of same paper: Messrs. McKee & Flannigan are finding richer ore than ever. They beat out in a small mortar over 100 pounds of gold on Friday evening last.... At Marble Springs appearances are indicative of splendid results. Dr. McLean, Chamberlain, and Douglas & Co. are going on well, and are said to have good work in sight.

Nevada County—

From the *Gazette* of Dec. 15th: The mill of the Pennsylvania company, which has been standing idle for several months, while the mine was being more thoroughly opened, will start up again for regular work on Monday next. Since the new hoisting works were erected, an incline has been sunk on the ledge to the depth of 75 or 80 feet below the old works, and from this point levels are being run in both directions—that to the north being some 25 feet, and to the south between 40 and 50 feet. They have out now some 60 or 70 tons of rock.

From same of 18th: We learn from A. F. Mason, Deputy Assessor, that the Rocky Bar

company, whose claims are situated near Washington, are now taking out gold in large quantities. The yield of their claims week before last was over eighty ounces, and of this about thirty ounces was taken from one pan of gravel.

From the Grass Valley *Union* of Dec. 13th: The Osborn Hill mine, or as it is more generally known, the Woodworth mine, was yesterday sold for \$30,000. The purchasers were W. H. Hooper, Thomas Jones, S. W. Lee, Robert and John Smith, A. Delano, William Campbell and Alexander Stoddard. This is one of the oldest mines about Grass Valley, and has paid second to no quartz mine in this township. It is regarded as very cheap at \$30,000.

From same of 16th: In the Union Hill mine the work of sinking for another level is energetically going on. Large quantities of first-class ore are being extracted from the present lowest level, the mill is constantly crushing, and the weekly yield of amalgam is a perfect eye-feast. The force now employed about the Union Hill mine and mill now numbers some sixty men.

The *Union* says: Fourteen mining companies, ten of which run their own mills, are now working extensive mines profitably. We challenge the State of Nevada to show as large a number of paying mines as this township alone can show.

The Eureka mine, since it became the property of its present owners, about one year ago, has paid a monthly dividend of from \$20,000 to \$50,000.

From the *Transcript* of the 15th Dec.: The mines on the ridge above San Juan are yielding largely this season. At Badger Hill the English Company have constructed a large amount of fluming. They have taken out a very large amount of money from the cement bed on which they are now working. At Columbia Hill, the companies working are taking out good pay, and the town presents a livelier appearance than it has for several years.

The Knickerbocker mine is located on Gold Flat and is supposed to be the extension of the Whigham. The claim was located last fall, and a crushing obtained which paid \$20 to the ton. The owners are now running a tunnel, which they expect will cut the ledge next week, giving them sixty feet hacks.

The following blue lead items are from the *Transcript*: The Gouge Eye is running night and day, and cleaning up about \$2,000 per week.

Williams & Riggs are running both their mills on good dirt.

Carney & Tucker are running a new tunnel to the back of their ground, being shut off by masses of boulders from the old works.

The Eastern is proposing to sluice off the top dirt as the best way of opening its ground.

Neice & West are running a new drift to strike the high bed rock on the west side of their claims.

Brown & Co. worked to the Hydelliff line, and have started a new tunnel westwardly to make a new breast.

Hydelliff & Co. have struck softer and richer dirt, and their claim is very promising.

Curran & Buckman have abundance of pay dirt in sight.

Jacobs & Sargent are running the Green Mountain mill twenty hours out of the twenty-four, with good dirt.

Cozzens & Garber are successfully pumping out the water let in by the recent cave of the cañon.

EXCELSIOR.—From the Meadow Lake *Sun* of Dec. 8th: Machinery for the Golden Eagle, Reduction, and Mohawk and Montreal mills, is now on its way from Cisco, and in less than ten days their whistles will awaken the echoes of our hills. But for the inclement weather of last week, the mills would before now have been in operation.

A correspondent of the Dutch Flat *Enquirer* writes from Meadow Lake Dec. 9th: At this time all but the principal claims of the district have closed their works for the winter.

The U. S. Grant Company, after having refitted their mill with a set of heavier stamps, is paying as rich, if not richer, than before. The California Company are sinking a shaft on the Knickerbocker ledge, and as soon as they have obtained a sufficient quantity of quartz will commence crushing. The Pacific Company are now having a large quantity of rock worked at the Winton mill, which is paying finely. The Gold Run Company are running a tunnel into their ledge, and will, in the spring, have one of the best opened claims in this section.

The writer of the above visited the Excelsior mine on snow-shoes, in company with a friend. They found it silent, owing to a defect in the working of the stamps. Returning, they found the ascending of hills on snow-shoes a very different thing from descending the same. So they shouldered their shoes and trudged home, sadder and hungrier men.

In the Mohawk and Montreal, Mr. Chappel-

let is pushing forward the work energetically. The machinery for the new mill of the company has just arrived at Meadow Lake, and will be transported over the snow to the mill site, which adjoins the mine, immediately, and be in operation just as soon as human labor can accomplish it.

Placer County—

From the *Herald* of December 15th: Capt. Mallett left with us on Thursday last a piece of rock from his claim. It will no doubt yield from twenty to thirty dollars to the ton. We are pleased to know that our mining prospects around Auburn are gradually brightening.

The New Mexico mine, located on the road mid-way between Auburn and Ophir, has recently proved itself handsomely. Out of a recent crushing of nine tons, the yield was ninety dollars in free gold. The vein is about fifteen inches in thickness, and is owned by H. H. Fellows & Co.

Sacramento County—

From the Folsom *Telegraph* of December 15th: A shaft is being sunk on the flat opposite this town, which is now over one hundred feet in depth. It was started on a worked out claim in what was formerly considered the bedrock. Various singular formations have been passed through. Sea-shells, petrified wood, and debris of an unknown age have been met with. The workmen are now working in a hard blue formation, and think the cement lies underneath it.

Shasta County—

From the *Courier* of December 15th: The proprietors of the Red Warrior claim are having a shaft sunk upon the lode, and are confident they have as good rock as any yet taken from the Chicago. Quite a number of assays of this rock have been had, and the result in every instance has been over one hundred dollars to the ton.... Henry Jones and Ed. Gage, while out prospecting one day this week, discovered a quartz ledge on the hill near Daniel's claim, and on reducing some of the rock found it to be surprisingly rich in gold. Several claims have been located on the ledge.

The quartz interest of the county is slowly but surely rising in importance, despite the many drawbacks which it has heretofore encountered. Incompetent superintendents, ignorant millmen, inexperienced miners, and the want of proper machinery and sufficient capital have all operated prejudicially to the proper development and progress of our mines; but these difficulties are in a fair way of being at least partially overcome.

Sierra County—

From the Downville *Messenger* of Dec. 15th: Work has been commenced on the "Venice," located about a quarter of a mile south of town. The croppings of the ledge are three feet in width. We saw some of the rock crushed and pounded down, which gave a very fine prospect.

From Port Wine letter to same: Mining prospects are improving in this locality. The Eagle Company lately cleaned up for two weeks work sixty-three ounces of gold. The Erie boys are getting ready, and anticipate doing better than ever, and the Monte Cristo still continues paying the usual revenue.

At Gibsonville, many of the miners are idle for the want of water, the yards and dump sheds being already full.

Letter to same from Howland Flat, has these items: The diggings at this place are paying remarkably well, all working a large force of men. The Union Company employ eighty. This company have a superior double track and tunnel two thousand feet in length, the best incline, four hundred feet in length, the most extensive gravel claims in California, and if pleasant countenances are any indication, the owners are acquiring a fortune.

The Hawkeye Company, after expending \$25,000 in running a drain tunnel now found to be useless, have determined to run another independent of all others. The work will occupy two years. The company is working a large force of hands in their front lead with very good results.... The Monumental are still running night and day, hard rock still staring them in the face.... The Pittsburgh Company at Potosi, has suspended drifting for the present. The men are to be paid off on Thursday. The future programme is only known to the owners.

Siskiyou County—

The Siskiyou and Shasta Butte Quartz Mining Company, on the Humboldt lead, are taking out large quantities of rock, which prospects finely. The owners of the Mexican lode have resumed work and will soon have their mill running.

Yuba County—

A letter from Paulinville to the Marysville *Appeal* of Dec. 13th, has the following: "The Mary Ann is now being opened and the rock prospects at least \$100 a ton. The ledge is about two feet wide at the top, and at thirty-seven feet has increased to three feet. The greater portion of the rock is decomposed—it all pays. I send you a package, which you

will please have Knight & Co. not to assay, but to "horn out." It is only an average specimen taken by me to-day from the center of the ledge. A party are running in a tunnel along the ledge and taking out rock such as I send you. Four men could now keep an 8-stamp mill supplied.

The next day's *Appeal* says the request was complied with, and the "honing out" showed the rock to be worth from seventy-five to one hundred dollars per ton.

Washoe—

NEVADA.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Virginia Union* of Dec. 10th: Capt. A. Taylor is about to commence surface mining just north of the Devil's Gate. He intends to employ eight men, and to run the earth through rockers. As it contains much free gold, and will yield by ordinary mill process \$10 per ton, the Captain thinks he can make a good thing. One man will work about two tons per day.

From the *Gold Hill News* of Dec. 11th: We do not remember of ever having seen better ore taken from any of the mines of Gold Hill than that which is being taken out of the Yellow Jacket at the present time. The ore shows large quantities of black sulphurets, and will undoubtedly pay from thirty to sixty dollars per ton. This ore is being taken from the new strike we mentioned last week.

From the *Territorial Enterprise* of Dec. 14th: Never have the mines of Nevada been yielding more abundantly than now, and never have those that are productive offered to capital so substantial a chance for investment. Among the incorporated Comstock companies, the following dividends have been declared for the present month:

Savage, payable on the 8th.....	\$100
Yellow Jacket, payable on the 15th.....	75
Empire, payable on the 8th.....	15
Imperial, payable on the 15th.....	8
Crown Point, payable on the 15th.....	50
Hale and Norcross, payable on the 15th.....	100

In addition to this princely dividend by the Hale and Norcross on the 15th, the Directors have decided to make the shareholders a Christmas present of another \$100 per foot on the 25th! By these six companies there will therefore be paid to their stockholders the present month the following amounts respectively:

Savage.....	\$80,000
Yellow Jacket, price \$1,250, about 6 per cent.....	90,000
Empire, price \$5, about 8 per cent.....	18,000
Imperial, price \$130, about 6 per cent.....	82,000
Crown Point, price \$1,100, about 4½ per cent.....	30,000
Hale and Norcross, price \$2,000, about 4 per cent.....	80,000
Total.....	\$330,000

The profits of the private Gold Hill claims will probably swell this aggregate of dividends for December to \$500,000—the yield of less than five thousand feet of the Comstock for one month, after deducting all expenses! As probably not more than twenty-five per cent. of the gross proceeds is paid in dividends, or an average, owing to the enormous cost of extraction and reduction, the mines referred to have produced not less than \$2,000,000 in bullion during the past month, or \$1,500,000 at the lowest warlike estimate—equal to \$18,000,000 yearly! We challenge the world to parallel this. First-class stocks have advanced considerably in price during the past fortnight, yet at their market rates yesterday they are yielding to stockholders (assuming the December dividends to be the monthly returns) interest on their investments as follows per month:

Savage, price \$2,100, about 4 per cent.....	
Yellow Jacket, price \$1,250, about 6 per cent.....	
Empire, price \$5, about 8 per cent.....	
Imperial, price \$130, about 6 per cent.....	
Crown Point, price \$1,100, about 4½ per cent.....	
Hale and Norcross, price \$2,000, about 4 per cent.....	

The average, it will be seen is about 3½ per cent. per month. Considering all the hazards of mining, this is a large return, and our productive mines certainly present extraordinary inducements to Eastern capitalists.

We are informed that a new and very promising quartz mining locality was discovered last week by a party of prospectors, among the red hills west of Truckee river, some forty miles west of this city, and near the route of the Pacific Railroad. The ledges are from two to six feet in width, and prospect exceedingly well in gold and silver. The discovery is said to have created quite an excitement in the vicinity, plenty of men being busily locating and recording claims, while the original discoverers are hard at work opening out their claims, anxious to develop their true value at the earliest practicable opportunity. A meeting of the miners will soon be held and the district named.

Reese River—

From the *Reveille* of Dec. 8th: Some 1,538 pounds of mineral were brought in from the Reveille District and carried to mill for reduction. The assay gives a yield of \$1,617.21 of silver per ton.

From same of 10th: The mills of the Manhattan and Metacom companies were to be set

in motion to-day. We learn that the Metacom has a good supply of ore on hand, with hundreds of tons in sight in the mine.

Same of 11th: Some excitement was caused last week by a report that the vein in the Great Eastern—one of our most important mines—had "pinched out." The pinch is admitted, and those are its consequences: During the month of October the Great Eastern sent to the Keystone mill for reduction 200 tons of ore, which yielded the handsome sum of \$27,000, an average of \$135 per ton. Early in November the vein began to contract, to pinch, and was able to send to the same mill in the whole of that month only 123 tons, which yielded \$36,000, being the average of nearly \$300 per ton. The vein had contracted nearly half its ordinary width, but so highly concentrated was its ore that a quantity about three-eighths less yielded \$9,000 more. The Great Eastern vein is peculiarly the "razor-blade" of the Reese River District.

We are informed by a letter just received from Mammoth District, that a Mr. Gillette had arrived there as superintendent of the Ural S. M. Company, which property had recently been sold to parties East.

We learn of the Buel North Star mine that recent explorations caught the vein unusually rich. One ton of ore reduced at the Keystone mill yielded at the rate of \$513 of silver per ton.

The Keystone is to be closed for two weeks for repairs.

From same of 12th: The mill of the Manhattan Company was set in motion yesterday for the first time since the incoming of General Agent Bowstead. The amalgamating apparatus and furnaces of the original ten-stamp mill are connected with the new twenty-stamp battery and powerful engine.

On the Timoke Company's claims, at Lander Hill, the incline has been sunk to the depth of 345 feet, which is far below the water line. At present, all of the ore extracted is taken from a single level but 100 feet from the surface, and where the mine is entirely dry. This ore is a beautiful black sulphuret and ruby, the working of which averages near \$200 per ton. The vein is from a ledge and a half to two feet in thickness.

Esmeralda—

From the *Union* of Dec. 8th: The Juanita mine is being worked with renewed energy.

Mr. George Ash is now working successfully a claim about one mile east of Moos. At a depth of about forty feet a bed of gravel was struck four feet thick, which prospects about sixty cents to the ton. So far as prospected, the pay streak is about thirty feet wide.

Mr. B. V. Poor and son have opened a new claim on Silver Hill, from which they are taking out a large quantity of rich ore. Mr. Livingston, Superintendent of the Empire Mill at Bodie, is daily expected from the East, where he has been making preparations for the active prosecution of the work on the mine. The Cornucopia Co., of Partzwick, has now en route for San Francisco 3,000 pounds of silver bullion. The bullion will assay in the neighborhood of \$5 per pound.

From the *Virginia Union* of Dec. 14th: Mr. Wilson, of the Walker River mines, gives us these items: Among the principal ledges, the Himalaya, Midas and Wheeler take precedence. The ledges are from eight to twelve feet thick, and in the first mentioned, the crops have been breasted across from the surface, and about sixty tons of ore taken for crushing. Its character is a peculiar honey-comb quartz, impregnated with free gold and some silver, and susceptible of easy amalgamation. In the Midas, an incline has been run some thirty feet, and two tons of ore collected for reduction; while from the Wheeler, 2,100 tons of ore worked at the Ogden mill rendered \$102.75 in gold and silver.

Humboldt—

From the *Register* of Dec. 8th: The Sheba mill is running on Yosemite rock. One lot of four tons, assorted, gave a yield of \$1,000. Sagebrush is the fuel used. In the North Star, S. L. Loomie has resumed operations, working two sets of men in tunnel and shaft. A specimen of ore before us, from the bottom of the shaft, is plentifully interspersed with native silver and indications of gold. Torrey & Whitmore have commenced operations on the Wheeler ledge, in Armbia—mineral similar to the Mootzuma. They expect to start smelting works sometime during the winter.

Mining matters are looking better at Winnemucca. L. C. Pease, agent for a New York company, is making times lively up that way. Workmen are engaged in running two tunnels—one to strike the Pride of the Mountain ledge 250 feet in, and continue to prospect for ledges beyond that point; the other to strike one of the ledges of the Union Series at a distance in of 300 feet. The ore is of no average value of \$65 per ton.

Black Rock—

From the *Plumas National* of Dec. 8th: We learn that the new mill at Black Rock has commenced operations. The returns of the

first experiment with this mill are anxiously awaited by all who are interested in this promising mining section.

Pahrumpagat—

A correspondent sends us the following: Messrs. Editors:—Mr. Raymond's five-stamp mill has now commenced running on what Superintendent Day considers average Pahrumpagat ore. This mill is simply a test mill, to ascertain the adaptability of our ores to the amalgamating process; and if the results are satisfactory—of which I have no doubt—the company, of which Mr. Raymond is the agent, will introduce machinery of any required extent to develop their ledges. Thirty stamps are now en route to this place—twenty via the Colorado river, and ten via Los Angeles. Two arastras, to go by water power, are being constructed at Crystal Springs. Our mines are rapidly passing into the hands of New York and other Eastern capitalists, and San Francisco is losing a prize which should have been theirs.

ORION.

IDAHO.

From the *Idaho City Times* of 30th Nov.: Several rockers, running on Main street, are paying from \$12 to \$50 per day. A number of them are taking dirt from tanoels and will be able to work all winter. The recent rains have revived creek mining in the various camps in the Basin. A large number of miners are now at work on Grimes' Creek, near Centerville and Pioneer City. Claims on Graioite and Wolf Creeks are also being worked. The tunnels in the vicinity of Placerville are being vigorously pushed forward.

At Rosenbaum's mill, the result of eighteen hours run, ending Saturday noon, was fifty-six ounces of amalgam, taken from the plates only; a thorough cleaning up would materially swell the amount. A new tunnel has lately been commenced about 200 feet above the main Juniata tunnel, which is about sixty-five feet in length, besides side tunnels, etc., now being run on the Juniata ledge, which is from three and a half to four feet in width. The ore is very rich.

A statement by John A. Post, revenue collector at Owyho, shows the currency value of bullion assays from January 1st, 1866, to be \$1,073,256.78. It is estimated that the product of the present year will be \$2,000,000, and that of the next year will go beyond \$5,000,000.

MONTANA.

From the *Helena Herald* of Nov. 29th: Spiers & Pierce are now engaged in constructing an extensive bedrock flume in Nelson Gulch, six miles from town. Eighteen hundred feet are already completed. The whole will be in working order in ten days, the weather coöperating good.

From the *Post* of Dec. 1st: Quartz in the Pipestone district is on the rise. The "cap" on the "Lioo" has been penetrated, and a five-foot vein of rich ore, now awaits the completion of Hermann's steam mill to crush the quartz. The locality H.'s mill is in, is not favorable to water power, owing to its attitude, and Mr. H. has now moved his mill close to the "Lioo" ledge, erected a fine building and applied steam power to his fifteen stamps. We shall soon hear of good returns from that quarter.

Fifteen hundred men are wintering on Elk and Bear Creeks, well supplied with provisions. A rich ledge was discovered a few days ago, one mile south of the Park ledge. There is a six feet vein of splendid looking ore.

The largest among the splendid silver lodes to be seen at the bank, is the proceeds of four tons of ore from the Rattlesnake ledge. On No. 3, Whitlatch Union, a rich deposit of ore was struck on Tuesday, which outstrips anything we ever saw. Mr. Rumley assayed a piece weighing five ounces, two pennyweights and five grains, and made return of it containing \$35.28. The quartz mill of the Bullion Mining Company commenced crushing on Monday. Only one crusher is being used at present. This mill is in Nelson Gulch, about six miles from Helena.

The Virginia and Nevada Ditch and Flume Company has been incorporated. Thirty thousand feet of gulch ground, heretofore valueless, will become a source of revenue through its operations. The ditch will convey 4,000 inches of water from the Passmore to a point near Highland.

Letter to same from New York Gulch, thus speaks of Gastoo and Simpson's mill there situated. The engine is of 40-horse power. The thirty stamps of 600 pounds each, falling thirty-five times per minute, crush on an average twenty tons every twenty-four hours. Everything is perfect—no jar is perceptible when the mill is running. It was completed on Aug. 29th, and has been in operation ever since. Lumley & Watson's arastra crushes 1,000 pounds of Home Ticket rock every six hours, at an average of \$51 to the ton. Wessels & Wilkes have a mill of six 500 pound stamps. Seven tons of ore from the "Star of the West" yielded \$387.50 in this mill. On this ledge there is an incline sixty-five feet deep. From the bottom are two levels on the

vein. The Grizzly is now being sunk upon. The Little Giant has a shaft forty feet deep.

ARIZONA.

From the *La Paz Gazette* of Nov. 29th: A letter dated Callville Nov. 10th, says there is a large immigration from the northern mines coming by that route.

Some of the mills at Prescott have been in a state of suspension for a short time. Berger's will start in a few days, under very favorable circumstances. There are three mines now fairly opened, from which rock enough will be obtained to keep the mill supplied. The Galena, the Dividend and the Chaparral: The quartz from all these lodes prospect well. Woolsey's mill is being overhauled, and is expected to start in a few days. Tyson & Coulter's mill, on Lynx creek, has been running for several weeks. They had some difficulty in saving the gold from rock out of the Eureka lode. The rock is rich in fine gold, but difficult to work, owing to the sulphurets, which increase as they descend.

A letter from Hardyville, says: Charles Strong has got his mill running. Everything works well, and results are highly satisfactory. In the tunnel of the Moss mine has recently been struck, at a depth of 180 feet below the top of the cropping, a splendid 5-foot ledge, smooth, well defined and fat with gold. A width of fifty feet prospects with fine gold.

The superintendent of the Planet mine, at William's Fork, writes officially to the Trustees of the company, that he has struck an immense body of ore, 600 feet long, and six feet wide, which assays from 20 to 40 per cent. Thousands of tons of this ore could be forwarded to San Francisco if there were facilities for transporting it.

COLORADO.

From the *Journal* of Nov. 27th: Mr. W. Lee cleaned up 217 ounces of gold last evening, the past week's yield from sixty stamps. The company hope soon to be able to run the other section of twenty stamps, now crusing for the Guocell Company, on their own ore. They have the best service of ore ever known in No. 2, Gregory, now. It is about five feet wide in the shaft which is now 425 feet from the surface, and in the east and west levels, fifty or sixty feet above, it is scarcely less. Last week and week before the shaft supplied forty heavy stamps. The pump works to perfection.

In Nevada district, the American Flag Company are getting out some very good ore which Mr. Whitcomb is going to run. Mr. W. is now crushing from the Colorado lode, surface pays about \$225 a cord. Mr. Coulee has started the mill and property of the Gilpin Company on the Burroughs. Mr. Cushman is working the Hardesty property. Mr. Mitchell is running the 12-stamp mill in Leaveworth Gulch and doing well, taking out something more than 100 ounces a week. The Ophir Company continue to make money, and Mr. Vezin's Mooser institution approaches completion.

In the Santa Fe lode, discovery claim, a shaft has been sunk and partially timbered, to a depth of about thirty feet, showing a clear, well defined crevice from four to five feet wide between walls, with about eight inches of very fine looking glenn in the bottom, some of which has been hauled to Lyon's smelting works for reduction.

At Argentine, Rothplatz has got a house up, packed in supplies, and is going to work about ten men all winter. He is driving adits or tunnels on the Ayres and Watson lodes. Mr. Watson's furnace is to be kept going during the winter on ores from the John Brown lode, situated three or four miles up the right fork, not having twenty-four inches of mineral, very rich.

From the *Denver News* of Nov. 28th: The Nonpareil Company have already paid in a large proportion of the original capital stock, and are determined to have their property in a paying condition next season.

We were shown, to-day, by Mr. Froese, a number of specimens of ore from the James Creek district, beyond Boulder. They are from several different veins at from ten to twenty-five feet in depth. The finest specimen is from the Buckhorn—at twenty-five feet depth—which is unquestionably rich copper, and tests are reported as having given from it one hundred and twenty dollars to the ton in silver. Other specimens of porous quartz and dirt from the Gold lode, are rich in free gold. A pan test of the latter, made in our presence, from two to three ounces, a dozen or more particles of fine gold.

UTAH,

Works are to be erected at Stockton, Utah, for the testing of ores. Dr. Fred. Davidis contributes an article to the *Vedette*, announcing the fact, and urging the propriety of offering to capitalists certificates of working tests from a reliable establishment, as a proof of the richness of a mine, rather than a quantity of picked specimens.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.
SAN FRANCISCO, Jan 11th, 1866.

Mr. Thos. J. Hall, is an authorized agent for this journal for the northern counties of this State. Dec. 1, 1866.

Mr. F. F. Frost, is an authorized agent for the PRESS for Amador and Calaveras counties. Dec. 1, 1865.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

San Francisco:

Saturday Morning, Dec. 22, 1866.

NOTICES TO CORRESPONDENTS.

"B. F."—OUR UNDEVELOPED IRON RESOURCES.—It is to be regretted that so little attention has as yet been paid in this State to the development of its iron resources. It was once observed by the late Francis Horner, after inspecting a steel manufactory, that "Iron is not only the soul of every other manufacture, but the main spring, perhaps, of civilized society." The celebrated John Locke even went so far as to aver that, notwithstanding man's extraordinary advancement in knowledge, we should in a few ages, "were the use of iron lost amongst us, be unavoidably reduced to the wants and ignorance of the ancient savages of America; so that he who first made known the use of that contemptible mineral, may be truly styled the father of arts and the author of plenty. In California we may daily witness practical examples of the above apothegms—the Digger Indian, with his flint-headed arrows and twisted bone fish-hooks, the living representative of the pre-historic stone age, here meets face to face with the enlightened civilization of what may be termed the golden-age; for literally as well as metaphorically, the present age may justly be so termed. Enormous as have been the increased yield of gold since the discoveries of that metal in California and Australia, the increased production of iron has more than kept pace with it. In 1825, the annual production of iron in England amounted to half a million of tons, at which period it was at the head of the world in this department of industry, whilst our own production was so limited that it scarcely obtained attention amongst statesmen. Last year, the United States produced, of pig iron, more than one million and a half tons, whilst England produced six millions, or an increase of twelve times the weight obtained annually in the latter country, forty years previously. More remarkable still is the growth of the iron business in the Liasic and Oolitic districts of England, which only began to spring into existence about twelve years ago, yet now amount annually to one million and a half tons, or full one-fourth of that produced in the entire kingdom, and is rapidly extending.

"H. P."—No; Morse is not the inventor of the telegraphy by the use of electricity. Several years before he constructed his first experimental telegraph, Dr. Jackson, of Boston, explained to him how such a thing could be done. Morse, at that time, was totally unacquainted with both electricity and galvanism. With regard to the first discovery of electric telegraphy, Arthur Young (1787-9) mentions the experiments of Lomond, who conveyed messages from one room to another. Francis Ronalds, who rejected the galvanic or voltaic electricity, proposed by some Germans and Americans, and now successful, transmitted signals a distance of eight miles. He wrote in 1823, and states that Cavillo proposed to convey intelligence by passing sparks through an insulated wire. (Penny Cyc. xxiv., 154.) The relation of electricity to magnetism, engaged the attention of the Electrical Academy of Bavaria as early as 1774. In 1777, Baccaria first noticed that an electric shock made the two ends of the magnetic needle change their position to east and west. It was not till 1813 that Oersted published in German his work on the identity of chemical and electric forces, which was immediately translated into French by Marcel des Serres. It was in October, 1820, that Oersted himself communicated in Thomson's "Annals of Philosophy" the method of causing the needle to diverge to the right or left by the voltaic force. In 1837, Cook and Wheatstone first took out their patent; and in 1841 the Great Western Railway, influenced by Brunel, had a line thirteen miles in length from Paddington.

IMPROVEMENTS IN THE DISTILLATION OF PETROLEUM.

Several important improvements have recently been made for aiding and rendering more complete the distillation of coal oils. The first of these inventions which we notice has been patented by Mr. O. Lago, of New York city, who has recently taken out a patent, which consists in an arrangement for the admission of atmospheric air, or other gaseous substances, into the goose-neck or exit pipe of the still, and in such a manner as to vary the point of admission, as may be found desirable, while the distillation process is in progress. The object gained is an alleged expediting of the process, and an improvement in the quality of the oils distilled. The improvement in the quality of the oils is produced by keeping down the temperature of the exit pipe, so that the hydrocarbon vapors cannot generate or form ammoniacal gases, which they always do when the vapors from crude petroleum or bituminous coal are allowed to pass through the still at a great heat. In accomplishing this, fresh or cool air must be admitted at such points as is necessary to preserve the proper temperature. If the object claimed is really accomplished, this invention would appear to be one of considerable value.

Another improvement in this direction, is announced in the English journals as having been recently patented by W. A. Verel, of Sterling. This improvement consists in a process whereby the distillation of shale or oils is carried on continuously, a separation being effected, during the process, between the spirit and oils of different specific gravities. This object is effected by the introduction within an ordinary still of an internal compartment or cup into which the oil for distillation and the superheated steam or air, which it is found convenient to employ, are admitted, and by acting upon only a small body of oil at once, which, as it distills over, is replaced by fresh oil, the process may be continued for any length of time without intermission. The separation of the different products into spirit and oils of various specific gravities is effected by means of internal gutters or troughs, similar to the gutter around the chemical instrument known as an "alembic," and placed at various heights round the inner sides of the still, into which the heavier oils, which do not rise so high as to pass into the still-head with the lighter portion or spirit, are caught as they condense along the sides of the still. The number of these gutters or troughs may be increased or diminished at pleasure, according to the varieties of oil required. For the distillation of the heavier portions which may flow over the internal cup or basin, it is found convenient to introduce a branch from the pipe containing superheated steam or air into the lower part of the outer shell, to play upon such heavy oil, and cause it to rise in vapor and condense on the sides of the still, whence it is caught by one of the inner gutters or troughs; to further aid this operation, fire-heat may also be applied externally; although the chief portion of the heat employed in this press of distillation is derived from the superheated steam which is admitted, and which passes out in connection with the lighter oils, and from which it is readily separated in the usual manner.

There appears to be decided advantages connected with both of these improvements, which are well worth the attention of all persons interested in the distillation of petroleum.

AN immense quarry of jasper has been opened near St. Gervais, in part of the Mont Blanc range of mountains, by a company who have sent some remarkable specimens to Paris. Some of those specimens are of a beautifully pure red, without veins, somewhat resembling the marble known as the *Russo-Antico* stone. The new opera house in Paris is to be ornamented with twelve columns and forty medallions of this stone, for the decoration of the state saloons.

PANS FOR WASHOE.—Six Knox amalgamating pans have recently been ordered at the Golden State Foundry in this city, for C. C. Stevenson's mill, at Gold Hill, Nevada.

SKILLED LABOR—THE MANUFACTURE OF STEEL.

It is stated in some of the Eastern papers that much difficulty is being experienced by the steel manufacturers of Pennsylvania, in consequence of the impossibility of procuring skilled labor. Some very interesting facts are given, in this connection, with regard to the main features in the production of a certain superior quality of steel.

In making this steel it is necessary that the workmen should not only subject their eyes to the most intense light; but that they should also be able to judge most accurately with regard to the character of that light. The duty required is to look directly into a glowing furnace, distinguish the crucible in its midst, remove the cover and judge accurately of the condition of its contents. But few, even among English workmen are skilled in this operation. There are not many, anywhere, who are able to distinguish even the crucible in the midst of the glowing coals which surround it, much less to remove its cover and accurately scan its contents. The effort of the eye, in this operation, is but little less than that required for gazing directly at the noon-day sun. The unpracticed eye, and especially if a little weak, can merely glance at it; the stronger and less sensitive can dwell for a moment upon its glories; but its surface presents only a glowing, swimming mass. It requires an eye of uncommon power to gaze the sun out of countenance, as it were, by keeping the organ of vision steadily fixed upon the burning orb, until its disk has assumed a well defined appearance and a steady glow, like the moon, but of vastly greater intensity. The writer of this has accomplished the feat in his younger days; but untold wealth would not be an inducement for him to repeat the experiment. Yet the task required of the workman in determining the condition of the glowing steel in the furnace, is scarcely less trying to the eye than that of looking steadily at the sun. In addition to which the power of judging the precise character of the transmitted rays, is something which but few ever can attain.

An experienced Pennsylvania manufacturer recently stated, in the presence of a number of practical and scientific gentlemen, that after persevering efforts, he has himself succeeded in distinguishing the crucible in the furnace, but he could go no further, and that he had thus far, with the aid of an expert, been able to train but one American to properly examine the contents of the crucible. It is said that the experts in this business in England, have formed associations to prevent the emigration to this country, of workmen who can perform this service. The forthcoming report which is to be made to Congress, on the condition and needs of the iron interest, by a special committee, who have recently visited the iron district to collect information to that end, will, it is said, embrace a large amount of interesting and valuable facts.

It seems strange that with the well known and ready applicability of spectrum analysis, to distinguish the characteristics of light, and determining the phenomena of burning media, this useful and delicate instrument has not been more generally introduced in observing the phenomena involved in furnace operations. It is far more delicate and reliable in its determinations than the best trained human eye can possibly become; and is in no wise wearisome or injurious to that delicate organ. All that is requisite for its use is a knowledge of the chemical operations which it is desired to induce or prevent, and the capacity to determine their operations when their spectra are painted, by their own action upon the instrument in the bands of the observer. We have seen the statement that it has been so employed in Europe, in some cases, and that the results were most eminently satisfactory. Cannot some of our scientists apply it to this particular operation, and thus place the Pennsylvanians quite independent of foreign aid. The subject is certainly worthy of consideration, although we are not aware that any suggestion of the kind has ever before been made.

LOWER CALIFORNIA.—J. Ross Browne, the Government Commissioner, for collecting mining statistics on this coast, has been employed by the Lower California Land Company, to make an examination of the peninsula, a portion of which they have lately secured by purchase from the Mexican Government. He will be accompanied by Mr. Gabb, of the State Geological Survey, who will be Chief of Internal Reconnoissance; Mr. Lohr, Topographical and Mining Engineer; and Mr. Randall, Secretary and Interpreter; besides assistants. The party will leave on the next steamer. Mr. Browne's report of the company will include papers by these gentlemen, and also by Doctor Taylor, Dr. Veatch, and others who have made specialties of certain subjects of interest to the company. A topographical survey of the Gulf and its islands will be made; and statistics in reference to those Mexican States which lie upon its Eastern shore will be collected. As the company intends to encourage immigration, a suitable site for a settlement will be selected. In view of the treaty now in preparation, which will convey to the United States some two hundred thousand square miles in the section under consideration—a country embracing within its limits gold, silver and copper mines, and a not inconsiderable pearl fishery, and which, moreover, commands the mouth of the Colorado river, destined to be an important thoroughfare—this expedition will be looked upon by the general public with special interest.

NEW REDUCTION PROCESS.—Mr. James Hitchens, of this city, has recently invented and put into practical operation, at the Union Foundry, quite a novel device for pulverizing quartz, for which he has taken steps to procure letters patent through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. This device consists simply of a cylindrical iron vessel, open at both ends, placed upon an iron table or bed-plate, and, by a crank motion, caused to move back and forth—the crank making about thirty revolutions a minute. The quartz, or any other brittle material, is thrown into this vessel while in motion, the vibrating action of which causes a great commotion and rapid attrition of the mass, which is furthermore aided by the grinding action of the bottom walls of the vessel, or the bed-plate upon which it rests. In order to prevent dust from inconveniencing operations, a cover is loosely thrown over the top of the cylinder while in motion. The arrangement appears to discharge quite freely, and reduces the rock very fine. The one now in operation is about two feet in diameter and two feet high. It will do about as much work as a 600-pound stamp, dropping fifty times a minute, and reduces the rock so fine as to apparently obviate the necessity for any subsequent grinding process. The question to be considered is the wear of the bed-plate and the amount of power required to drive the apparatus. Will the bed-plate wear evenly and without being cut into grooves through which coarse sand may escape? The inventor is determined to give the device a thorough trial, the results of which we shall report in full.

MACHINERY FOR MEXICO—QUICK WORK.—The Miners' Foundry received an order the past week, for an 8-inch cylinder steam engine, to be completed in four days, so as to be ready for the Mazatlan steamer. The engine was delivered on the morning of the fifth day, every part of which, including a heavy bed-plate, cast in sections for convenience of packing, was manufactured from the rough. The whole was all done within regular working time, there being no night work put upon it. This engine is designed for the Balajaqui copper mine, located a short distance inland from Guaymas, and owned by R. C. Jones. We notice the above as an instance of pretty rapid work, with great facilities for doing the same. The improved political condition of things on the Pacific coast of Mexico, will doubtless cause a new impetus to mining matters there, the effect of which will be most advantageously felt in this city, in the increased demand for machinery and mining supplies.

TO WRITE IN THE DARK.—Mr. John Synnot, of this city, has devised a very neat and simple apparatus by which any person may be able, after a little practice, to write in the dark. When folded up it presents the appearance of a small writing case, with a drawer for paper. On opening it a frame is presented, under which a sheet of paper may be placed and securely held, while guided by certain movable wire rods extending across the same, the writer may indite his words, in direct lines across the sheet, while his progress is followed up by a sort of sliding check, which keeps his place if he has occasion to leave his work, so that he may always know exactly where to begin again, when he returns. The rods are held in notches upon the opposite sides of the frame, and moved down the sheet, line by line, as the writing progresses. After the letter has been written and folded, the same instrument enables the writer to properly place upon the envelope the address, etc. A patent for the invention has been applied for through the Mining and Scientific Press Patent Agency.

POSTAL TELEGRAPH.—Leading members of Congress are said to be in favor of a telegraph line from Washington to New York, to be placed under the control of the Postmaster General, and declared a post route; each message to bear a one-cent stamp for a given number of words. We consider this a step in the right direction; and look forward to the time when the "lightning line" will, in a great measure, take the place of the present comparatively "slow coach" mail transportation. We believe that a Government telegraph, with a charge of say ten cents for every ten words or less, would be a paying institution. Of course, the mail routes would not be done away with. Business messages would be sent by the wires; but the voluminous effusions of gushing school-girls must, of course, be entirely beyond the means of any "parient" but a Hayward or a Pierce.

PATENT OFFICE CHANGES.—Recent changes in the examination of models and preparation of patents have been made in the Patent Office, which will result, it is expected, in saving to the Government of from forty to fifty thousand dollars a year. The specifications of models, which have been heretofore written by copyists, are in future to be printed. One hundred and eight copyists are now employed in writing these specifications, so numerous are the demands for certified copies of patents from the department.

ARIZONA INDIANS.—Governor McCormick, of Arizona, arrived in this city a few days since. His visit is at the request of the citizens of that Territory, and his object is to lay before the military authorities the immediate necessity for more efficient protection against Indians. It is high time that the Government take such measures as will result in their extermination. The savage, relentless, murderous hate which they exhibit towards even their best friends among the whites, is sufficient evidence that a conciliatory course would be thrown away upon them.

FOSSILS IN SANTA CRUZ.—The *Sentinel* speaks of some specimens of marine fossils which Mr. Matherson, the County Surveyor, procured in "Section 1, town 10, south range, 2, west, Mt. Diablo meridian." The whole mountain, 3,000 feet above the sea level, is one mass of these fossils, imbedded in a lime cement.

THE SUTRO TUNNEL COMPANY ask only \$400,000 from the mining companies as a starter, to be paid in instalments as the work goes on. The rest of the amount required will be subscribed at the East.

HANSCOM'S CRUSHERS.—Some months since, the Ogden and Vivian mills, in Nevada, ordered two of the above named machines, which we learn are working satisfactorily.

AMALGAM SPECTING has become a very common occurrence in the Washoe mills. About twenty of the prominent millmen have organized themselves into a detective association.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, new and important inventions, also, the list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with dispatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

DESULPHURIZING ORES.—Messrs. Tait and Avis, of New York, have patented the process of desulphurizing sulphurets by a current of heated compressed air, propelled by a suitable pump, in combination with a closed furnace containing the ore. Also the use in this process of nitric acid gas in combination with the atmospheric air; also the use of steam in combination with the heated air.

COMPRESSED PEAT promises to become valuable for other purposes than fuel. A patent has been taken out, by which picture frames, book backs, card paper, moldings and decorations for furniture, brick for building purposes, fronts for stores and dwellings, and all other purposes in which bone, india rubber and gutta percha are component parts, can be manufactured from peat.

A NEW MODE OF DEEP SEA SOUNDINGS.—Mr. Sidney E. Morse of New York has recently obtained a patent for a new philosophical instrument, which he calls a "bathometer." When thrown overboard, it goes to the bottom, and on being brought to the surface, the greatest depth of water is found indicated by a scale, very much as the degree of heat is noted on a thermometer. The depth of water is determined by the pressure to which the instrument has been subjected.

BINDER FOR SEWING MACHINES.—George Vincent, Stockton, Cal.: I claim the combination of the plates, A and C, with blocks, G, and its spur, H, operating substantially as above described and for the purpose set forth.

PASTRY ROLLER.—Joseph S. Foster, San Francisco, Cal.: I claim the combination of the revolving board, B, the roller, C, the adjustable guide racks, D, D, with the rods, e, e, e, e, operating substantially as and for the purpose specified.

BALANCED SLIDE VALVE.—John Loehhead, San Francisco, Cal.: I claim the over-hanging edge or flange, e, of the ring, D, in combination with opening, b, in the valve, D, and with the inner surface of the steam chest cover, constructed and operating as described.

RECENT INVENTIONS.

A NOVEL FIRE EXTINGUISHER.—A novel fire extinguisher has been tried in England with most successful results. It consists of a brass vessel, similar to that equipped with an ordinary soda fountain. This fountain is charged with due proportions of water, carbonate of soda and tartaric acid. The result is a factitious soda water. The "fountain" is strapped upon the back of an individual, with a small short hose attached. By turning a stop-cock the fluid material is allowed to escape, and under a pressure of sixty or seventy pounds to the inch, projects a stream some thirty or forty feet. The nozzle of escape is not more than one-eighth of an inch in diameter; yet such an amount of carbonic acid is discharged as to produce a most wonderful effect upon so much of the fire as comes within its reach; not even a spark is left—the fire is absolutely annihilated. For the extinguishment of incipient fires in buildings, etc., such an apparatus might doubtless prove of essential service, and for such purposes, prove valuable adjuncts to the ordinary fire apparatus.

PROTECTION TO FIREMEN.—An invention, designed as a protection to a fireman, on his entrance into a burning room has recently been tested in Quebec. It consists of a finely perforated brass ball, attached to the inner extremity of the brass nozzle of the hose, which acts as a powerful rosette, throwing a heavy spray upon his person, while he is directing the main stream upon the fire before him—thus smothering the flames all around the holder's person.

STILL ANOTHER IMPROVEMENT in the way of fire extinguishing apparatus, has recently been devised by Mr. H. J. Johnson, of Providence, R. I., the object of which is to retain the water in the hose, at full pressure, when the engine ceases working. A faucet is attached to the nozzle, which shuts back the water whenever desirable, and the extra pressure operates upon a delicately-adjusted valve, in an attachment to the engine, and which in fact becomes a part of it, which opens and permits the water to flow back into the engine. This relieves both hose and engine from any extra pressure. The engine continues working as long as may be desirable, the water in meantime circulating through the valve, which ceases the instant the nozzle is opened and the water begins to flow through the hose.

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, in which the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE.

Patent Agents, 505 Clay street, San Francisco.

LIGHT AND HEAVY STAMPS, AGAIN.—In our issue of the 15th inst., we copied a portion of an article from the *Colorado Journal*, in which is given Mr. Bertola's opinion of 350 pound stamps. The *Amador Ledger* quotes this, and makes the following remarks:

"Experience has not settled the question of 'light vs. heavy stamps' in this State, of quartz mills, but 350 pound stamps are now rarely met with. The range is from five to seven hundred, with a strong prejudice among experienced millmen in favor of the latter. Colorado must be far behind the times—350 pound stamps, 'dropping thirty times a minute.' The average here is over seventy, and even sixty for the heaviest stamps would not be tolerated."

Our millmen, we believe, all agree now that 350 pound stamps are too light for common use, although they may be suitable for very soft rock. The weight of stamps should depend something upon the character of the rock worked. Some experts say 450 pound stamps are heavy enough for any use. A greater number, however, prefer those weighing from 500 to 600 pounds. In crushing soft rock the stamp can be raised to a less height than for pulverizing hard ores. The 700 pound stamps, in ordinary hands, doubtless crush faster than the 500 pound, but it is questionable whether their work is not accomplished at a sacrifice of power, and with greater wear and tear of the machinery. Large stems with stamps of small diameter are well calculated to economize the power which is sometimes in a measure lost with large stamps when the rock lies on one side of the center; the blow being in that case less direct. This subject is one upon which we would like to hear the views of practical workers.

SALT IN NEVADA STATE.—Nearly three years since, we noticed in our columns the "Sand Springs" salt mine, situated on the road from Virginia City to Austin, and about seventy-five miles from the latter place. A mill has recently been erected on the Divide between Virginia and Gold Hill, for the grinding of the salt for table use. It is, according to the *Virginia Union*, two stories high and fifty feet long. Durr stones reduce about one ton per hour. This salt is found to be an excellent article for curing meats, for butter making, and for table use generally. Large quantities are used in the quartz mills in the neighborhood for amalgamating purposes. The affairs of the company are said to be in a prosperous condition. For the amount of money invested, it is one of the best paying institutions in the State of Nevada.

City Amusements.

METROPOLITAN.—At this house the attendance has been good, notwithstanding the bad weather. The Howsons and Edouin have appeared in "Deeds of Dreadful Note," "Kiss in the Dark," etc., followed by the ballet. "The Star of the Rhine" was withdrawn, and the "Boquet" substituted during the week. The concluding pantomime, "The Golden Egg," which has been very successful, gives place this week to "Jocko, or the Brazilian Ape."

OPERA HOUSE.—Lady Lou's engagement is drawing to a close, and those who see her before she leaves for the East, must go soon. The burlesque of "Lalla Rookh" has been the principal feature of the week.

ACADEMY OF MUSIC.—The Japanese are still drawing crowded houses by their wonderful feats of skill and strength, which must be seen to be appreciated. This week they have introduced a six-ladder feat, which is one of the most difficult yet given. The performance on the rope exceeds anything of the sort ever attempted in this city.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the MINING AND SCIENTIFIC PRESS.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requirements of the Department, and properly filed all necessary papers as Claim Agents.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

CHEAP SULPHUR.—It is claimed that the Hudson River Copper company will soon be able to lay down sulphur in New York at one-fourth the cost of Sicilian sulphur. They will obtain their supply from the sulphurets of iron or mundaic overlying the copper veins of the Hudson river. If sulphur can be thus materially reduced in price, it will prove of immense advantage to petroleum refiners, as well as to all the various arts which require in their present condition any very considerable quantity of sulphuric acid.

NATURAL CERIOSTIES FOR CHRISTMAS.—At No. 522 Pine street, E. F. LONGCIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shell, and Wax Flowers, besides Feathers, Birds and Butterflies, for ladies' hats, Shells, Sea-weeds, etc. 21v13-qr

ALLEN'S LUNG BALSAM!

For the Cure of Consumption and all Diseases of the Lungs.

This BALSAM is introduced to the suffering public after its merits for the positive cure of such diseases have been fully tested. The formula from which it is prepared is referred to by the leading medical journals as being equal to any prescription that can be made up, for such diseases, by the medical faculty. The BALSAM is, consequently, recommended by physicians who have become acquainted with its great success. As an expectorant it has no equal. DR. A. L. SCOVILL, who has, for many years, been known to the public throughout the United States as the inventor of remedies for the lungs, recommends ALLEN'S LUNG BALSAM as surpassing anything that has ever been offered to the public for the cure of Lung Diseases. He has used it in his own family with great success in the case of his sister, who was supposed to be in the last stages of consumption. This lady is now well, and has been permanently cured by Allen's Lung Balsam. 22v13-1m

A. S. Hallidie & Co.,

MANUFACTURERS OF FLAT OR ROUND WIRE ROPE, For Mining, Shipping, Ferry, AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach, SAN FRANCISCO.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fourth the bulk of Hempen Rope; is spliced and repaired in the same manner. The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to any of whom we prefer these interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether wire or hemp rope, to prevent the rope from chafing. We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable shores and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—for Ships' Rigging, Derrick Gays, Ferry Ropes, and all standing purposes.

Steel Wire Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$ to $\frac{1}{4}$ inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on band.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

To Capitalists.

GOLD QUARTZ MINE, SITUATED IN CALAVERAS County, with steam mill fitted up with Amalgamating Pans, etc. FOR SALE. The mine has three main veins, and more than \$50,000 have been spent in opening them and completing the mill. Good wagon roads all the way. Apply to BELLOZ FERRES, Bankers, 535 Clay street, San Francisco. 23v13-6m

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Ram, Box, Screw and Drop Presses, Combing Machinery, File Drivers, Bark and Malt Mills and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotive, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zeiss Wheeler's improved flat bottom pan, Bellini's pan, Veach's table, Prater's concentrators, Wallace's pans, Beer's pan, German Patents, Aranza Gearless, Galle Mills, Sellers of all descriptions, Reports of all sizes and shapes, for silver and gold, Portable Flange Mills, Sprague Batteries, for wood or iron frames, Dry Crushing Batteries or machines with the latest improvements, every variety of Stamp, Mortar, Cam, Pans and Tube. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron screws, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

Pipes, Wrought Iron
Work, etc., etc.
Manufactured to Order.
Old Boilers Repaired.
D. CAMERON.

PETROLEUM AT THE PARIS EXHIBITION.
Governor Curtis, of Pennsylvania, has deter-
mined that the petroleum resources of this
country, and that State in particular, shall be
fully and properly represented at the Paris Ex-
position. To that end he has appointed Mr.
J. T. Briggs, of Titusville, a Commissioner to
Paris, to have this special business in charge.
Mr. Briggs is now engaged in making up a full
collection of samples from the various States.
California will be there, of course, as our Com-
missioner has already prepared a full set of
samples, crude and refined, wherewith to illus-
trate our resources in that direction. Petro-
leum has come to be one of our most important
articles of export, and it was a happy thought
of Governor Curtis to make it thus a specialty.

HOW TO PRESERVE FISH.—A foreign sci-
entific journal says an excellent mode of causing
fish to retain its freshness for a considerable
time, during the hottest weather and very long
carriage, consists in making with bread crumbs
and a sufficient amount of strong spirits of
wine a paste of considerable consistency, filling
the mouth and gills of the fish with it, then
wrapping the whole in fresh nettles, and plac-
ing outside an envelope of straw. Fish treated
in this way have been carried very great dis-
tances during the hottest part of the sum-
mer.—Exchange.

The paste employed as above, would be
perfectly innocuous, while it would form a
most excellent absorbent for the gases which
might be produced. The straw is employed
on account of its well known properties as an
extremely bad conductor of heat.

One can now breakfast in Sacramento, pluck a
rose from the bush before his door, lunch in
Cisco, 6,000 feet above the level of his break-
fast table, where he is surrounded with snow
and ice fields which remind one of Alpine
scenery, and returns to his home to dine. All
the time, too, enjoying a fragrant Havana in a
luxurious car—that is, if he has got the
Havana. Those herculean engines have so far
found no difficulty in driving snow ploughs of
sufficient size to keep the track clear of snow.

CALIFORNIA BRASS FOUNDRY.

Francisco for the last fourteen years, and enjoys the re-
putation of having built ONE HUNDRED AND SEVENTEEN
STEAM ENGINES.
Screw Propellers of all kinds and Steam Boat Machinery
generally, made to order, and warranted to give perfect
satisfaction in every particular. 13v13-ly

ANOTHER MINING SWINDLE.—The New Yorkers were very much excited, a few weeks since, over the collapse of a mining company, known as "The Downville Gold Mining Company," with a capital stock of \$200,000, in shares of one dollar each. By a careful manipulation, the managers who put the stock in the market at thirty cents, soon succeeded in running it up to par, and a few days afterwards to nearly 200 per cent. premium. The stock was, in reality, not worth the paper upon which it is printed. Nearly the entire amount of the stock is supposed to have been palmed off at an exorbitant figure. It is known that one party was victimized to the tune of \$22,000, two others to the extent of \$10,000 and \$13,000 respectively, and a fourth for \$7,000. A large amount was got off in small lots. Some of the victimized parties have commenced suits against the operators for obtaining money under false pretences.

BELLAMBI COAL!

A SUPERIOR ARTICLE OF

SMITH'S COAL,

FOR SALE IN QUANTITIES TO SUIT,

At Greatly Reduced Rates.

Sacked to order for Shipment to the Country.

Apply to

FLINT, PEABODY & CO.,

408 CALIFORNIA STREET, San Francisco.

Bell's Assay Office.

THE UNDERSIGNED, HAVING FORMED A COPARTNERSHIP this day, would inform the former partners and the public generally, that they will continue the ASSAY BUSINESS in all of its branches at the old stand,

No. 514 California street,

One door west of Montgomery, San Francisco, with the same employes, under the name of Rogers & Brown. MR. EDWARD WOLFFER, for the last seven years Assayer for Mr. Bell, will have charge of the Assay Department.

The Melting Department will be under the charge of MR. HENRY J. FISHER, for ten years in the United States Mint at New York and Philadelphia, and for the past seven years with Mr. Bell.

We would inform photographers that we are prepared to work their chloride of silver and ashes from their paper city plates.

We have, in connection with our Assay business a MILL and are prepared to

WORK GOLD AND SILVER ORES,

In quantities from 25 to 50 pounds; also, Assayers' Sweeps.

GEORGE E. ROGERS,

H. W. BROWN,

October 13, 1866.

Machinery.
Brodie's Patented Improvements

FOR THE TREATMENT OF
Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms:
No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$850
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.
JAMES BRODIE, Esq., San Francisco—My Dear Sir: I give you pleasure to inform you that, for the past three months had one of your largest sized Rock Crushers in use at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
R. P. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st No. vember, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Notice to Miners,
Well-Borers and Water Companies.

M. FRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing, &c.

M. FRAG,
8v13-ly Stove Store, No. 125 Clay street, below Davis.

Such a journal has been needed on the Pacific Coast. The Press fills the bill. [Reese River Reveille.]

THIS CUT REPRESENTS AN AMALGAMATOR AND SEPARATOR THAT HAS STOOD THE TEST OF EIGHT YEARS' practical working in the gold mines of California, and for nearly the same time in the silver mines of Nevada, having been introduced into the first steam mills built in the then Territory, since which time they have been successfully working against all competition.

The great advantages these Amalgamators have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury, and collect any that may have been "sleekened" in the battery or grinders.

3d. The "sloshing" motion given to the pulp (by the revolution of the miller under the stationary frame) against the amalgamated copper plates that are fastened to the frame, and by this means catching the fine gold and mercury that will not settle.

4th. The gate in the cone, through which the pulp is discharged, from the top, and where there is the least motion, almost precluding the possibility of any granulated mercury or fine gold escaping.

There are over 500 of them in use in California and Nevada, where those interested can see their practical workings.

PATENT HYDRAULIC HOSE SEWING
By S. HOWARD,

Three Seams sewed with twenty-ply Twine, are guaranteed to stand the pressure of a 200-foot fall. Twenty-five cents per yard.
One to three-ply Hose made. All orders promptly attended to. SEWINGS MADE TO ORDER, OR REPAIRED AT SHORT NOTICE.

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test 1 Orescent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyrites, and the so-called "rebellious ores," are having especial attention and their successful treatment. Assaying in the humid and dry way. Also, roasting by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been organized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

New Mining Advertisements.

Ancient River Channel Blue Gravel Company.

—Location: Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of November, 1866, an assessment of two dollars (\$2) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of January, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourteenth day of January, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Chuk Mountain Blue Gravel Company.—Lo-

cation of Works: Nevada County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the fifth day of November, 1866, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Isaac Smith	31	250	\$375 00
Marlin White	5	100	15 00
A. D. Bowmer, Trustee	24	100	150 00

And in accordance with law, and an order of the Board of Trustees, made on the fifth day of November, 1866, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Messrs. Olney & Co., at No. 418 Montgomery street, San Francisco, Cal., on Saturday, the twenty-second day of December, 1866, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, No. 10 Government House, corner Washington and Sansone streets, San Francisco, California. dec3

Colorado Silver and Copper Mining Company.

Notice.—The Annual Meeting of the stockholders of the Colorado Silver and Copper Mining Company, will be held at the Company's office, No. 524 Clay street, San Francisco, on MONDAY, December 24th, 1866, at 3 o'clock P. M., for the election of Trustees, and the transaction of such other business as may properly come before it.

B. W. MUDGE, Secretary.

10v14w

Dios Padre Gold and Silver Mining Company,

Alamos, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of December, 1866, an assessment of three dollars (\$3) per share was levied upon the capital stock of said Company, payable December 15th, 1866, in United States gold and silver coin, to the Secretary, E. C. McComb, No. 1 Government House, corner Washington and Sansone streets.

Any stock upon which said assessment shall remain unpaid on the third day of January, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-second day of January, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. C. McCOMB, Secretary.

Office, No. 1 Government House, corner Sansone and Washington streets, San Francisco, Cal. dec3

And in accordance with law

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

Machinery.

LEFFEL'S American Double Turbine

THIS WHEEL, WHICH HAS HAD THE most unprecedented sale of any water-wheel ever made, and which has given unusual satisfaction whenever used, is now for sale by KNAPP & GRANT, 310 Washington street, San Francisco, where persons desiring to use water-power can be supplied. These Wheels are adapted to use from 10 to 5,000 inches of water, and from 4 feet to 500 feet fall. Let us know how much water you have either in miner's inches or cubic feet per minute, what fall you have, and what power you require. Write or send for circular to KNAPP & GRANT, San Francisco.

Leffel's Lever Jacks,

For railroads, cars, or wagons: Railroad Jacks for engines and cars; Track Jacks for leveling, with which three men, with a pair of these Jacks, can level more track in a day than twelve men working in the ordinary manner; also, Track Jacks, for relieving the axle of pressure to replace the brass. These Jacks are now in general use in the Eastern States, and give entire satisfaction. Also, Wagon and Track Jacks of the most superior make and kind. For sale by 12v12-3m KNAPP & GRANT, San Francisco.

HUNTER'S IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

ANDREW HUNTER, Inventor,
San Francisco.

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,
416 Market street, San Francisco.

21v13f 28 Second and 110 Jessie streets, San Francisco.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
San Francisco.

PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the Mining and Scientific Press, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner.
SAN FRANCISCO, June, 1866. DWEXY & CO., Patent Solicitors

Brevities.

It is said that the Salmon River mines will be a point to "rush" to in the spring.

SCARCELY any good white wine will be made this year in Europe. So much the better for Californian vine growers.

NEW YEAR'S POINT, forty-five miles south of this city, the scene of the late Coya wreck, is to have a light-house.

THREE yachts sailed on the 11th inst. from Sandy Hook for the Isle of Wight. The stake upon the race is \$90,000.

J. Q. A. WARREN is sending a fine collection of rare hot-house plants to Honolulu, where they will thrive in the open air.

A SPLENDID billiard saloon is being fitted up at the Occidental Hotel in this city. It is 128 feet in length, and will have twelve tables.

DAMAGE by fire to the amount of \$1,000 was occasioned a few days ago on Bush street, by the filling of a petroleum stove while lighted.

A TWELVE-HORSE POWER steam carriage, built for use on ordinary roads, has been employed in France to draw canal boats. It was placed on the tow-path, and worked well.

The Suez Canal will be completed in five months. Arab laborers are employed; and have at last been induced by the engineers to use wheel barrows.

They have had a severe earthquake shock at the Dalles. The buildings swayed frightfully. Mount Hood is again smoking.

Let the *Alla savant* put that and that together.

A COMPANY of wealthy residents is organized for the purpose of building a railroad from Guadalajara to Lake Chapala, in Mexico. This will open up what has been called the "Garden of the Republic."

FIVE hogsheds of Rhine wine have been preserved in a certain Bremen wine cellar ever since the year 1625. At that time each hogshed was worth about fifty dollars; but if that sum had been put out at a compound interest, it would now amount to a thousand millions of dollars.

THE Pioneer Steam Marble works in this city, expect hereafter to supply all those articles of that material which have heretofore been imported from the East. The company owning them have some \$50,000 invested in the business, and own the only quarry of black marble that has been opened in the State.

A COUPLE of WAGS in Marysville, on the night of November 13th, when every body was looking out for meteors, procured a dozen large rockets and a number of Roman candles, and proceeded quietly to "send them up." Some of the spectators still contend that the "shower" of '66 was remarkable for the brilliant display of colors.

THE labor of exploration at Herculeanum will be greater than at Pompeii, the former city having been more completely and more deeply buried. It is expected also that the quantity of valuables found will far exceed those found at Pompeii; inasmuch as the inhabitants had not time to carry them away when the fiery storm commenced.

A RIVAL to WASHOE.—Captain Hubbard writes from the Philadelphia district, sixty miles southeast of Austin, Nevada, to his father in Marysville, thus:

The Combination company (this is Lew Moore's company) is about to put up two mills of forty stamps each, and two more mills are to go up on the Transylvania, where yesterday they struck as good ore as the High Bridge's. I have two hundred feet in a ledge which assays \$3,142.50 at a depth of twenty feet. Woods & Buel purchased a claim a few days ago for \$10,000, for which I am told they have refused \$100,000. You will hear a greater pow-wow about this section in less than six months than Virginia City ever created.—*Appeal*, Dec. 12th.

It is believed by many that an ancient river bed crosses underneath the American river, and beneath the formation upon which Folsom stands, and that throughout the valley of the Sacramento the same extends; even under the city of Sacramento may lie rich deposits of gold. So says the *Folsom Telegraph*.

The farmers of Calaveras county have formed a league. We copy the first article of their Constitution, which defines the purpose of the league:

"Art. 1. The object of this League is to procure such Amendments to the existing Laws of the United States in regard to the public lands as shall be necessary to adapt them to the circumstances and wants of the people in the Mining Districts of California, and to organize our efforts for that purpose."

In Europe, passengers on railway trains are always locked into the cars; and a man who happens to be thus imprisoned in the same compartment with a desperado, or an insane man, is in a bad fix. A new means of communicating with the conductor has been adopted on the Lancashire and Yorkshire Railway. It is thus described:

"By pulling a chain, a panel between the compartments of the carriage is opened, and by the same action two rockets in a box on the roof of the carriage are discharged, causing a report which is heard for the entire length of the train. The lid of the box, which is painted red, is elevated, thus showing the compartment from which the alarm has proceeded."

That portion of the Nevada county Assessor's report which relates to mining matters, is as follows:

"There are seventy-one quartz and cement mills in the county, fifty of which are engaged in reducing gold bearing quartz rock, and the remainder earth and gravel cemented by mineral crystallization. No returns are given of the yield of the cement mills. One hundred steam engines are employed in pumping, hoisting and running mills. Of thirty-six mines the machinery is operated by water power. Only fifty-seven companies report the number of employees, the aggregate as reported being 1,797. The superintendents of thirty-two mills give the amount of work done during the year, and from their reports it is shown that 85,000 tons of rock have been crushed in those mills. In my opinion this is less than half the amount of rock crushed in the county."

CEMENT WORKING.—The Silver Mountain Bulletin says, in reference to the cement in the neighborhood of Placerville:

"We are satisfied that if, after crushing, the pulp be treated with steam or hot water, in 'mullers,' double the amount will be realized than from the cold water process now in use. The yield from this cement rarely falls below twenty dollars per ton, which makes it more valuable than quartz of double that yield, as three times the quantity can be worked in the same time, and nearly all the gold it contains saved, if a proper system of working it be pursued."

A microscope which magnifies 15,000 diameters has been constructed in London by Messrs. Howell and Leland, and described before the Royal Society. It multiplies the surface area of an object by about one thousand millions.

PUBLIC ADMINISTRATOR'S YEARLY ACCOUNT.

OFFICE OF THE PUBLIC ADMINISTRATOR,
San Francisco, July 1st, 1866.
To HENRY M. HALE, Esq., County Auditor, City and County of San Francisco.

Herewith I submit an account of all the Estates of Deceased Persons which have come into my hands as Public Administrator during the year ending June 30th, 1866, with the Value of each, the Money paid thereon, and the Balances due said Estates; together with a return of all Estates administered on by me, and remaining unsettled. Respectfully,

J. W. BRUMAGIM,
Public Administrator.

ESTATES SETTLED AND DISTRIBUTED.

The following named Estates, mentioned and included in my last Annual Report, have, since the rendering thereof, been settled and distributed:

John Gorman, Peter Reynolds, Thomas Jones, William R. O'Reilly, Peter Barcelona, James Morrow, John Wietz, J. H. Feldhus, M. A. Langdon, Sarah Mack, Charles Deady, Lloyd Magruder, Walter Pratt, James Willis, James McCready, Charles M. Nelson, Clara Clifford, William Humpstall, Edmund D. Hammond, Jeremiah Mead, Charles H. Raymond, Henry M. Oliver, C. J. Theis, G. T. Fouque, Mary B. Smith, John O. Neil, Michael Douchet, H. R. Rowland, John Higgins.

UNSETTLED ESTATES.

The following named Estates, mentioned and included in my last Annual Report, remain unsettled. The condition of each is as follows:

JAMES McLAUGHLIN.—Money Received, \$1,038 25; Money Disbursed, \$251 99; Balance on hand, \$1,686 27; Fees of Administrator, \$71 53.

PATRICK HUGHES.—Balance Money on hand, \$22 75; Fees of Administrator, \$1 84. Ready for Distribution.

ANDRE JOINNY.—Value of Estate, \$102 00; Money Received, \$102 00; Money Disbursed, \$91 80; Balance on hand, \$10 20; Fees of Administrator, \$4 08. Ready for Distribution.

JOHN HAYES.—Value of Estate, \$324 30; Money Received, \$324 30; Money Disbursed, \$102 06; Balance on hand, \$132 24; Fees of Administrator, \$12 96. Annual Account filed.

A. J. KING.—Partial Distribution of Estate made to heirs. Balance on hand, \$657 11. Estate ready for final Distribution.

E. A. MULLER.—Appraised Value of Estate, \$900 00; Money Received, \$340 00; Money Disbursed, \$135 00; Balance on hand, \$105 00; Fees of Administrator, \$39 60.

THOMAS THOMAS No. 2.—Balance of Money on hand, \$143 90; Fees of Administrator, \$20 00. Final Account filed, and Estate ready for Distribution to heirs.

JOHN DAVIS.—Money Received, \$175 35; Money Disbursed, \$33 00; Balance on hand, \$232 35; Fees of Administrator, \$7 00. Estate ready for Distribution.

THOMAS FLANAGAN.—Appraised Value of Estate, \$2,697 00; Money Received, \$463 60; Money Disbursed, \$571 00; Advanced to the Estate by the Administrator, \$107 50. Fees of Administrator, \$104 00. Accounts filed and proceedings pending to sell Real Estate, to pay creditors and close Estate.

THOMAS MOORE.—Value of Estate, \$43 17; Money Received, \$43 17; Money Disbursed, \$2 12; Balance on

hand, \$41 05. Fees of Administrator, \$17 72. Estate ready for Distribution to heirs.

BARTHOLOMEW W. LYNN.—Appraised Value of Estate, \$1,500 00; Money Received, \$250 00; Money Disbursed, \$207 71; Balance on hand, \$150 29; Fees of Administrator, \$60 00.

CAROLINE M. ROBB.—Appraised Value of Estate, \$1,244 00; Money Received, \$337 21; Money Disbursed, \$439 02; Advanced by Administrator, \$101 78; Fees of Administrator, 4 per cent. on final settlement. Proceedings pending to sell Real Estate to pay creditors.

JOHN LOCKAN.—Appraised Value of Estate, \$1 665 15; Money Received, \$265 12; Money Disbursed, \$388 35; Balance on hand, \$376 80; Fees of Administrator, \$36 00. Annual Account filed.

WILLIAM LOBB.—Appraised Value of Estate, \$975 20; Money Received, \$975 20; Money Disbursed, \$222 50; Balance on hand, \$552 70; Fees of Administrator, \$39 00. Annual Account filed.

WILLIAM FITZGERALD.—Appraised Value of Estate, \$50 00; Money Received, \$32 00; Money Disbursed, \$7 00; Balance on hand, \$25 00; Fees of Administrator, \$2 00. Estate ready for Distribution to heirs.

WILLIAM COWEN.—Appraised Value of Estate, \$100 00; Money Received, \$40 00; Money Disbursed, \$2 00; Balance on hand, \$58 00; Fees of Administrator, \$1 60. Estate ready for Distribution to heirs.

JAMES PEABON.—Appraised Value of the Estate, \$2,924 45; Money Received, \$1 168 08; Money Disbursed, \$1,312 70; Advanced to Estate by Administrator, \$144 71; Fees of Administrator not ascertained. Estate in litigation. Real Property claimed adversely to Estate.

ALEXANDER THOMPSON.—Appraised Value of Estate, \$50 00; Money Received, \$50 00; Money Disbursed, \$31 40; Balance on hand, \$18 60; Fees of Administrator, \$2 00. Estate ready for Distribution to heirs.

JOHN BERRY.—Value of Estate, \$80 00; Money Received, \$80 00; Money Disbursed, \$4 20; Balance on hand, \$75 80; Fees of Administrator, \$3 20. Estate ready for Distribution to heirs.

ANDRE FOULIER.—Appraised Value of the Estate, \$1,462 25; Money Received, \$1 462 25; Money Disbursed, \$392 74; Balance on hand, \$1,169 51; Fees of Administrator, \$48 49. Proceedings pending for Distribution to heirs.

WOOD.—Nativity of Deceased, Massachusetts; Appraised Value of Estate, \$78 75; Personal Property, all; Money Received, \$75 00; Money Disbursed, \$75 00; Fees of Administrator—no charge made. Condition of the Estate, closed. Amount of Estate paid over for funeral and other expenses.

ESTATES UPON WHICH LETTERS OF ADMINISTRATION HAVE BEEN ISSUED, BUT NO PROPERTY RECEIVED.

Letters of Administration have been issued on the following Estates, but no money or other property has come into the possession of the Administrator, nor any Fees received thereon. The property of several Estates consists of claims to land not yet determined:

Robert Dwyer, T. B. McManus, John J. Coombs, C. E. Truck, Wm. P. Hamilton, Charles S. Norris, Helling Major, Horace Cole, James E. Calloun, J. W. Phipps, Julia W. Burns.

The foregoing report includes all the Estates administered upon by me during the year ending June 30th, 1866. As a number of the Estates are still unsettled, the amount of Fees cannot be stated, but the same will, on final settlement, be 4 per cent. upon the amount administered in each Estate.

All of which is respectfully submitted,
J. W. BRUMAGIM,
Public Administrator.

J. MARSHALL W. WYLLIE

GLASGOW

IRON AND METAL IMPORTING CO.,

GAS FIXTURES, etc. They offer the same for cash, on liberal terms, at wholesale and retail. The Company have superior facilities for supplying the constant demands of

the Country Orders punctually attended to. 1913-q

THE LABOR SAVED

BY USING</

RAILROAD FOR SOUTHERN CALIFORNIA.—A new scheme for a railroad through Southern California has been proposed. The plan is to connect Sacramento city with Fort Yuma, via Fort Miller, in Fresno county. The road will be about 600 miles in length, and will pass directly through a large portion of the richest agricultural region on the Pacific coast. A district which is rich in mineral wealth, but which is now languishing for want of cheap means of transportation, would by this road be brought near to San Francisco. It is to be hoped that the project will be carried out.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. SMITH, M. D., Consulting Physician; R. S. MACBETH, M. D., Attending Physician; W. G. W. HANFORD, Manager; H. ANDERSON, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings. 16v13-1f

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. 16v13-1f

To Owners of Mineral Cabinets.
A miner in Nevada has a lot of choice Crystals, which he desires to dispose of at reasonable rates to parties who may desire to complete their display of minerals. Address the office of the "Mining and Scientific Press." 19v13-1f

HALL'S SARSAPARILLA,
YELLOW DOCK AND IODIDE OF POTASS.
THE BEST BLOOD PURIFIER KNOWN.
Persons that are troubled with Rheumatism, Scrofula, Neuralgia, Morbid Liver, Salt Rheum, Pimples, Boils, or any of the many diseases that originate from Impure Blood, would find it much to their advantage to give this justly celebrated article a trial. One or two bottles are quite sufficient to convince the most skeptical of its merits. It contains neither Spirit, Arsenic nor Mercury, which cannot be truly said of any other preparation called "Sarsaparilla."

Rheumatism !!
Still Another Witness!
LATROBE, Cal., Sept. 19, 1866.
(White Oak Township, El Dorado Co.)
This is to certify, that I have suffered over thirty-six years, been afflicted with Chronic and Intermittent Rheumatism, and the sufferings and tortures I endured in consequence cannot be told. I have, at an expense of thousands of dollars, employed many physicians, both in this country and in Europe (where I was born and resided many years), among which were several eminent professors of medicine, and I experienced no benefit from their treatment, more than at times a slight and temporary relief.
About two years ago I was induced, by some persons who had been cured by it to use Richard's Remedy for Rheumatism. It is enough to say that I was almost immediately relieved, and that I have not suffered with it since. I keep the medicine on hand, and on the first approach of any returning symptoms, I take a few doses, which invariably puts it to flight. I therefore cordially recommend it to be tried as an unfailing remedy for Rheumatism.

—FOR—
Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the **Mining and Scientific Press.**
Orders from the Interior faithfully attended to.

Endorsement by the Miners' State Convention
The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:
Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the **Mining and Scientific Press**, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Mining and Scientific Press.

Terms: One Year, \$5; Six Months, \$3.

Single Copies, Fifteen Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS,
And Patent Solicitors.

SAN FRANCISCO, SATURDAY, DECEMBER 29, 1866.

VOLUME XIII.
Number 26.

TO OUR OLD PATRONS.

With the closing issue of the year, we take the opportunity to urge upon those of our patrons, whose subscription expires with this volume, to be prompt in their renewals. The lack of a few numbers, by failure to promptly remit, will hereafter be found a serious loss to the subscriber; every one of whom should file his paper. The value of this paper, after its first reading, for the library and for future reference, will soon be found to far exceed its first cost. Hence, as a large number of our subscribers commence with the year, we would again, at this particular time, urge upon all such the propriety of a prompt renewal of their subscriptions. We are already under many obligations to our friends for the interest they have manifested in the success of our enterprise, in their prompt remittances, in special efforts to extend the circulation of the paper, and in the substantial assistance which many have rendered in furnishing us with valuable matter for publication, whereby they are furthering not our interests alone, but those of the entire mining and mechanical community as well. We trust their efforts in this direction will still be continued, in return for which we shall labor more zealously than ever to furnish the people on the Pacific coast, with a journal which shall be second to none in the world, in the special and important field in which we have chosen to labor. While thus mindful of favors received, we cannot forbear a brief allusion to a few promises made, but never fulfilled. With many, we are well assured, the neglect is one of thoughtlessness, with others one of necessity. But we trust no one who has the means and disposition to favor us in our undertaking, will be deprived of the benefits they might derive therefrom by either procrastination or a total neglect to secure the continuance and weekly receipt of the Press. We often hear from a subscriber, that a single number has benefited him more than the entire subscription for a year could have done, expended in any other manner. Such cases, we are persuaded, are not rare. A glance at the index of the past half-yearly volume, which accompanies the present issue, is sufficient to show the inquiring reader the general scope and extent of the information furnished in our columns, and the value it possesses for future reference. It will still be our aim to introduce improvements from time to time, as occasion may require, or as our increased patronage may warrant. As an evidence of this, the paper will appear on Saturday next in a new dress, from the first font of type ever cast on the Pacific coast, thus illustrating, in our own progress, the advancement of the arts and manufacturing industry of the community which we represent.

COMMUNICATIONS RECEIVED.—“The Use of Iron Sponge for the Reduction of Metallic Sulphurets, Antimonides, etc., by Edward Pique; “The American Silk Worm,” from Prof. Brewer, of Yale College; “Light for the Mines,” by J. Mosheimer.

THE PUEBLO LANDS.—The telegraph announces that the city's title to the “Pueblo Lands” has been decided in favor of the city. So that vexed question has now been finally and forever settled.

DEEP MINE HOISTING.

As mining becomes deeper, the cost of hoisting the ore becomes a matter for the most careful consideration; and in very many cases the success or failure of a mine turns upon this very point. Our attention has been more particularly called to this fact from seeing the numbers of hoisting apparatus connected with good mines, so totally inadequate to the requirements of the mines, and so far behind the modern style and system of such work. However, more attention has been paid to the matter latterly, especially in the neighboring State of Nevada; but its great importance should place it before the miner as a necessity, next to the existence of paying ore, and fully justifies us in referring to it at this time at considerable length. We trace, as one of the chief causes of the large expense of raising ore from great depths, the wear and tear of ropes, which result from an improper proportion in the arrangement of hoisting machinery, and direction of line of hoistway. Small drums and sheaves are primarily at the bottom of the trouble, and without going into any scientific analysis, let us consider, practically, how they operate. Take a short piece of large rope, size or secure both ends by binding them with strong twine, and it will be readily seen that it takes considerable expenditure of power to bend this rope into an arc of small radius. It is therefore evident that a great and useless expenditure of force is required to simply bend the rope. Now this is not only a useless expenditure, but is more than useless—it is absolutely destructive to the rope, by munching and chafing its fibers. Here it is that the small diameter of the drum tells against the wear of the rope, by deflecting it beyond its limit of elasticity, displacing the fiber and causing an external chafing and rubbing together of the threads.

Almost every old California river miner has had occasion to untwist a rope used for driving the pumps, and which almost invariably runs over very small pulleys. All such persons must remember how the interior of the rope was cut up into short yarns, three or four inches long, and have no doubt wondered what held it together. The same operation goes on to a greater or less extent, in all ropes which are allowed to change their angle over small sheaves, or wind on small drums. The constant bending and unbending of the rope, over such small circles, finally results in the internal destruction of the rope, before it really has an opportunity to fairly wear the rough off the outside yarns.

Another thing, which receives but little attention in round ropes, is the groove of the sheave over which the rope runs. This should always be of the right shape, to permit of the rope coming in contact with it to nearly one half its circumference. The effect on rope of a large, flat groove, is to flatten and destroy the fiber on one side; this is the case, both with hemp and wire ropes. And, again, a round rope should never have but one layer coiled on the winding drum. A second layer coming on top of the rope, has a destructive effect from chafing, in its efforts to shed itself. Many engineers place a layer of old rope

around the barrel of the drum, which very soon adapts itself to the worm-like groove, formed by the coiling up of the hoisting rope, and thus prevents the injurious result which always arises from winding on a flat surface. The winding drum should not be too close to the mouth of the hoist-way, so that the rope be not too much deflected from a straight line, as it winds itself along the barrel of the drum. This refers more particularly to round ropes, as flat rope winds one part on top of the other, like a taps line, retaining its line with the hoist-way.

AN IMPORTANT CONSIDERATION.

In all cases where an overhead sheave or pulley is used, it is a very great assistance to the rope to set the sheave on rubber humpers, or other suitable arrangement of springs, as the elasticity of the spring relieves the sudden jerk given to a rope when the engine is started; which jerk, unless relieved, works rapid destruction to the rope. On inclines, in practice, many things combine to render the strain and wear upon the rope more uncertain—such as the imperfect balancing of the load, obstructions in front of car wheel by falling rocks, etc., etc.

THE PROPER SIZE FOR WINDING DRUMS.

It is a safe rule, where round rope is used, to make the winding drum 100 times the size of wire rope, or fifty times the size of hemp rope. Wire rope, being so much smaller than hemp ropes of equal strength, does not require as large a drum, for the reason that it is more pliable for the same strength. Thus an iron wire-rope 2½ inches in circumference, requires a drum 250 inches in girth; while a hemp rope of equal strength, six inches in circumference, requires a drum of 300 inches girth. Steel ropes have lately been introduced, and are very much in favor. For steel ropes the drum need be only 100 times the size of the rope. A steel wire rope, two inches in circumference, equals in strength a two and one-half inch iron, or a 6-inch hemp rope; and requires a drum 200 inches in girth. (Ropes are measured, by the manufacturers, by their circumference or girth.) There are many ropes working to good advantage on smaller drums than here set forth; but the above proportion is well borne out in practice. In many cases we have observed the winding drum of good size; but whatever advantage is derived from this, is usually quite negated by the overhead pulley being of very small dimensions. In reference to the

ECONOMY OF DIFFERENT KINDS OF ROPE.

It may be remarked that, for the last fifteen years, ropes made of iron wire have been almost universally employed in the deep mines of Great Britain for hoisting ropes, and there can be little doubt of their economy, for their durability far exceeds that of any fibrous material. Perhaps the most striking feature is their extreme lightness, when compared with hemp ropes of equal strength—being as six to ten; and in bulk or area, as one to five. They have also the advantage of not absorbing water, and not being affected by atmospheric changes—a matter of great importance for work on an outside incline, where the stretching and shrinking of a long rope creates so

much trouble in delivering the car at its proper place. Moreover, the first cost of wire rope is less than that of hemp, strength for strength. We find that steel wire rope possesses some advantages over that made from iron; equal strength weighing six-tenths of iron rope, and having about one-half the bulk, and it is also better adapted to small drums and will stand rougher usage. We have seen many steel ropes in use in the vicinity of Howland's Flat, Sierra county, doing excellent service.

In this connection it may not be out of place to extract from Ure's Supplement, page 1,091, the following scale, showing the relative values of ropes of hemp, iron and steel:

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.		Steel Wire Rope.		Hemp Rope.		Chain.		Equivalent Strength.	
Circ. in.	Wt. per 100 ft.	Circ. in.	Wt. per 100 ft.	Circ. in.	Wt. per 100 ft.	Size Link.	Wt. per 100 ft.	Brk'g Load.	Wt. per 100 ft.
2½	10	1½	33	5	130	1 3/8	266	8	2,300
2½	53	2	65	6½	130	1 3/8	341	12	3,700
3	170	2½	91	8	236	1 3/8	533	18	6,300

COUNTERBALANCING ARRANGEMENTS.

Many plans have been suggested, where two ropes are employed, to arrange the winding of the ropes in such a manner as to counterbalance each other in all positions, and to equalize the strain on the engine while hoisting. Various contrivances of counterbalances and compensating arrangements, have been tried; but they have been generally discarded. The most successful provision seems to be the conical drum, with a helix for the rope to wind on. But the late improvements in cut-offs have, to some extent, remedied the difficulty.

FLAT ROPES.

Ropes made flat like a band, in the proportion of five times the width to one of the thickness, are very much used for vertical shafts. Flat ropes, so made, possess many advantages over round ropes for this work; and where two ropes are employed, as is usual, they counterbalance each other to a considerable extent, and equalize the strain on the engine. They have no inclination to twist, thus causing the bucket to revolve while ascending, when it is not provided with guides. The hoisting machinery for flat ropes is more compact and economical, runs smoother, and is under easier control. The barrel on which the flat wire rope winds, should be in diameter not less than 150 times the thickness of the rope. The rope is kept in position on the barrel by means of arms, the space between which should be about one half inch wider than the width of the rope. These ropes are being used to good advantage at the deep mines in the vicinity of Virginia City. The Gould & Curry company have been constantly using, for about three years, a flat wire rope made in this city.

CONCLUSION.

To the practical man, engaged in mining, this matter of economic raising of ores from great depths, should be made a matter of much study; for difficulties enough, and almost insurmountable ones, have to be overcome, without making success problematic, in cases where forethought or judgment can effect a different result. We believe that too little attention has been paid to this subject in California; hence, we have prepared the above hints thereon, which we place before our readers as hints, fully realizing that they are by no means exhaustive upon this important subject. We may return to it again at some future time.

The coal panic in England is subsiding, and discoveries of new coal veins are reported from Shropshire.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Properties of Sodium Amalgam.

EDITORS PRESS:—This subject has excited considerable interest of late, but is not so well understood by our metallurgists as it should be. It has been truly said, with reference to mechanical operations, that the constant improvement of all kinds of machinery demands a higher degree of intelligence in workmen than was formerly needed. The same is true of metallurgy. In proportion as science is applied to practice, and reason replaces rule of thumb, operatives must enlarge the scope of their acquirements, and acquaint themselves with the *why* as well as the *how* of what they do. A certain class of people, who usually affect to be very "practical," are fond of decrying science and scientific men, forgetting that many things which are now thoroughly practical and quite commonplace, were, a very short time ago, the unrealized dreams of some scientific man or "crazy philosopher" starving in his garret.

True, inventions and discoveries meet with more ready acceptance at present than they did in former times; but instances are not wanting, even in this city, of men in the possession of valuable discoveries suffering for want of appreciation, or, perhaps, for lack of the art of coining their brains into money, with which to purchase food and raiment. It is too often the case, unfortunately for themselves, that learned and ingenious men are not good men of business. I will not say that this hue and cry against scientific men and scientific means, is altogether without foundation; but, it is frequently the mere cloak of conscious ignorance and stupidity, which, like the cuttle fish, strives to conceal itself beneath a cloud of its own making.

I have nothing to say in favor of those conceited or vicious pretenders, who, with a mere smattering of learning, set up to work wonders, and fail for want of knowing the first principles of what they undertake; nor do I mean to say that all operators should, or can be, truly scientific. But there is no danger of knowing too much, and it is surely the duty of every man to acquire enough knowledge pertaining to his business to enable him to use intelligently the means placed before him by those who know more.

In regard to sodium amalgam, while I have no doubt its value is greatly over-estimated by those interested in its sale, it is equally undervalued by many who might be benefitted by its use, for want of a correct knowledge of its nature.

Some having a vague notion of the relation of sodium to soda, think that caustic soda will answer the same purpose. Others suppose that the presence of sodium ought to prevent lead and other base metals from entering the amalgam. Some imagine that the effect is so transient as to be valueless; and I have perceived, with astonishment, that one gentleman of intelligence, and generally correct views, has fallen into the preposterous misconception that it was intended to *decompose* the ores of silver by the agency of sodium—a proceeding of which the expense would hardly be the greatest inconvenience.

For the benefit of unlearned readers of your paper, I will, with your permission, point out some of the properties of this metal, which renders it a useful auxiliary in the collection of the precious metals.

Sodium is simply a metal, just as iron or lead is. Soda, called caustic soda, is the oxyd or rust of sodium, just as common iron rust is the oxyd of iron. Sodium has so strong a tendency to combine with oxygen, that, when thrown into water, which is composed of oxygen and hydrogen, it takes the oxygen, and becomes soda, which dissolves in the excess of water; the hydrogen escapes.

Sodium amalgamates with quicksilver just as gold and silver do, and in this state it still takes oxygen from water or air, so that if mercury containing sodium is put in a kettle, and

some clear water added, numberless small bubbles will be seen to rise through the water. These bubbles are hydrogen. When they cease to appear, the sodium has been all converted into soda, and dissolved in the excess of water; or, if there is not enough water present, it forms a crust on the top of the quicksilver. If tasted, it burns the tongue. Quicksilver charged with sodium should not be exposed to air or water long before it is used; for nine ounces of water will convert twenty-three ounces of sodium into soda.

Sodium has also a strong tendency to combine with sulphur, forming sulphide of sodium; and with chlorine, forming common salt. In all these cases it leaves the quicksilver and dissolves in water, if that is present. Quicksilver, also, combines with oxygen, sulphur, and chlorine, though with vastly less force than sodium; but the compounds so formed do not dissolve in water. Trying to or dissolve in the rest of the quicksilver, impairing its power of amalgamating with metals.

When sodium comes in contact with oxyd of quicksilver, it takes the oxygen and sets the quicksilver free; and so with the sulphide or chloride; and in this lies its power to revive foul quicksilver, and impart to it a bright, clear surface. But sodium has no power to remove lead or copper, or any base metal from quicksilver; on the contrary, it facilitates the amalgamation of all metals. The substances which it removes are not metals.

Sodium in amalgam is also capable of taking sulphur, chlorine, etc., away from silver, lead, copper, arsenic, etc.; but, as the metals thus set free, whether precious or base, pass into the amalgam, it would be very inconvenient as well as expensive to use sodium in this way.

But how is this action to be prevented? It cannot be done; and herein lies the necessity of discrimination in the use of sodium. It should not be used with raw ores abounding in sulphurets. With such ores, the surface of mercury containing sodium becomes covered with particles of sulphuret, which adhere to it while undergoing decomposition, and the amalgam becomes charged with base metal in proportion to the quantity of sodium used.

Galena decomposed thus, will give 4.5 ounces of lead for each ounce of sodium; sulphuret of antimony, about the same quantity of antimony, etc. I will here observe that the terms sulphide and sulphuret have the same meaning. The case of chloridized silver ores, containing much lead or copper, is similar. But it does not follow that sodium amalgam is useless in such cases. It is precisely in working raw sulphureted ores that the quicksilver is most liable to become "foul;" and sodium, for reasons already explained, acts like a charm in cleaning it. Indeed, I am tempted to regard this as the most important use of the substance in this connection. It is to clean ores of free gold, and to "dead roast" sulphurets, the direct application of sodium amalgam will be most beneficial.

When lead or other base metals are to be removed from quicksilver, it must be done by means of distillation and by dilute nitric acid. Sodium is useless for this purpose. As for the duration of the amalgam of sodium, much depends upon the extent to which it is mixed, small globules, with the pulp, and upon other circumstances. It may vary from half an hour to several hours; and, in cases where it is desired to keep the quicksilver constantly charged, attention must be paid to its addition from time to time.

I am aware that some look on the effect of sodium amalgam as more electrical than chemical. It is not necessary to the purpose of this article to discuss the point. Perhaps I may say the distinction, in the light of progressive knowledge, is fast losing its characteristic difference. The tendency of modern science is to generalize. The most intimate relations are beginning to be seen between things hitherto looked on as quite distinct. Even the so-called elements are destined to be reduced in number, perhaps to two, possibly even to one simple substance, in different conditions. The theory of mutual convertibilities appears, at first sight, to threaten the world of science with chaos; but it is the beginning of order.

C. H. AARON.

STEEL instruments can be effectually protected from the atmosphere and prevented from rusting, by covering them with an ointment made of one part resin to three parts fresh ard. It will do for a plow or a lancet.

It is reported that Dr. Veatch has got up a Concentrator which will run through six tons of tailings in twenty-four hours, requires no attention, and will cost only \$30.

The French government is selling off old-fashioned arms to the Siamese.

[Written for the Mining and Scientific Press.]

Mining in Silver Mountain.

EDITORS PRESS:—The many readers of the MINING AND SCIENTIFIC PRESS wish for facts in relation to the developments about being made in the vast mining field on the Pacific slope, and you, as editors and publishers of the paper, have, so far, in your endeavors to gratify their wishes, done nobly. When miners see and read an article in your paper, either scientific or descriptive, they place reliance on it; when they see it in a political party newspaper, they in general pass it by as the "idle wind which they regard not." and gotten up by some interested person to serve some miserable selfish end, for which the publisher gets well paid—perhaps a percentage on some speculating humbug, by which the community is to be gulled. You seek to establish the reputation of your paper, and to give it a widely extended circulation by dealing with stern facts. You deserve, if you do not obtain, success. The miner who buys a pick to enable him to look into Mother Earth, should also buy and read your paper, which, if he did, would in several instances save him many a hard blow.

I will try and give you some facts relative to the progress of silver mining in Alpine county as a trifling compensation for the reading of your paper, which I borrow of a friend, being too poor to buy it.

The hard times have decimated, or rather sifted our population, until the cheat or chess is mostly winnowed out. Silver mining is slow of development. In a museum in England there is one of the oldest silver coins known, found, I believe, in the Island of Cyprus. This coin has on one side of it the representation of a tortoise (the slowest of animals), as emblematical of slowness of development. As it was with silver mines when the world was young, so is it now; there are but few exceptions—the famed Comstock mine at Virginia City is one. The mines of Alpine county will only give up their riches to those entitled to them, and only as the legitimate reward of labor and toil—not merely spasmodic labor, but to labor that becomes chronic. Some of our spasmodic miners have emigrated to the frozen regions of the North—to Idaho, Montana, Lake Superior and Russian-America; some to the sunny South—to Arizona, Mexico, South America, and some even farther south. They can all well be spared; there are some few who remain, and are still to be seen traversing around billiard saloons and rum holes, too proud to work, afraid or too lazy to steal, and too poor to *secede* or get away; they hang around as sign boards for liquor sellers, waiting for something to turn up, but never turning up any thing themselves, except a glass of liquor; but the determined, resolute, *nil desperandum*, never-say-die-men, remain and work away, night and day, with courage and faith as strong as ever. They believe they have good grounds for faith and courage, and these are some of the grounds of the "faith which is in them."

THE MOUNTAIN MINE

Is being worked. It is located at the upper part of Silver Mountain, south of Main street; it is under the charge of J. A. McCuen, a model superintendent, a man who works with both hands and head. They are now in with their tunnel 950 feet, hammering, pounding, drilling and blasting night and day, aiming directly at the heart of Silver Mountain. They have already cut two or three great arteries, but will not be content until they have dissected it, and struck the very seat of life—the great silver lode itself. The ribs of the old mountain are of the hardest kind—trap, porphyry and granite. Two shifts of men, working ten hours each every twenty-four hours (Sundays excepted), can make but six or seven feet per week. Muscle, money and mind are all put to work in the right direction—the desired end must and will be obtained; the superintendent, in addition to his other duties, does the blacksmith's work. The rock is so hard that he is often obliged to sharpen one hundred drills per day. He is a man of the General Grant stripe, for he says he will fight it out on this line if it takes a dozen summers, throwing in the winters. Like General Grant, he also has his enemies, for there are some who would prefer a sort of McClellan superintendent. If McCuen is retained, he will never make peace with Silver Mountain until it surrenders up its silver.

THE WASHINGTON MINE,

Situated opposite the lower part of town, is now in with their tunnel 800 feet; they have struck a rich lode and have been running on it 240 feet; they have taken out and have ready for working 250 or 300 tons of rock, which it is confidently believed will pay \$80 per ton. Their lode varies in width from eighteen inches to four feet; at present it is only two feet in width, but said to be richer than ever. Very many specimens from this mine would create a sensation at the World's Fair in Paris. But of specimens there has been a surfeit; they will no longer pay a dividend or sell a mine. Sam. Hawkins, the former assessor, is superintendent, and he is determined that, if elected again, he will have something heavy to do with the Washington mine. Ere long they will show some specimen bricks which will open the eyes of a distinguished geologist, who has written disparagingly about the silver mines of Silver Mountain. The truth is, geologists, like other people, know a great deal more about the mineralogy of a country after the miners have run a few miles of tunnel and sunk a few hundred deep shafts. Then they can see *surface indications* which they would not see before. The Washington company have so much faith in their mine (maugre the reports of a State Geologist), that they have put up a quartz mill within a mile of the mine, and to-day, whilst I am penning this article, ten stamps are pounding ore—the steam-whistle is heard making better music to many ears than Paganini or Ole Bull ever did. Connected with the mill is a furnace for roasting ores when they are of a refractory kind, which is the case with the ore of the Morning Star mine. The works are to be under the supervision of Messrs. Kustel and Uznay. Mr. Kustel's work on Metallurgy gives evidence of his knowledge of mineralogy, and this mill, it is confidently believed, will prove it conclusively. They have contracted for 10,000 tons of ore from the Morning Star mine. This refractory, rebellious ore of the Morning Star has been worked at Freiburg, in Germany; but has not been successfully worked here or at Virginia City. It is now about three years since they have been experimenting on this Morning Star rebellious ore—it was four years that we were engaged in experimenting upon the rebellious South; but they had to yield, and it would be strange if we could not bring this rebellious ore to terms, and make it yield up its silver as the South yielded up slavery and Secession. With Union science and Yankee grit, Alpine county will come out all right yet.

THE I.X.L. MINE

Has commenced work to-day, and have let a contract for 150 feet. Some eighteen or twenty thousand dollars worth of silver bricks were taken from this mine about a year ago, when it was concluded by the San Francisco trustees to try the freezing-out process, instead of the Freiburg; but the tables were soon turned upon them, and they were frozen out themselves, and a new set of trustees, men of known and tried integrity, were elected, who are quietly and resolutely going to work the mine for the benefit of the stockholders. J. G. Haven is the superintendent, or rather managing agent, and he, with the trustees, will do his best to show the mine is well entitled to its name.

THE DEL MONTE.

Messrs. Mylett, Jardine, Burke and Smith, went resolutely to work a short time since in the Del Monte lode, in Scandinavian Cañon, near town. In ten days they sunk a shaft thirty-two feet deep, and struck a ledge in twenty feet, which is now five feet wide, which "gives the promise of things hoped for, and the evidence of things not seen." Many of the best miners think they have struck a rich thing.

THE KOH-I-NOOR,

On the side of the hill south of town, are expecting soon to strike the lode, and are working night and day. They do not expect to strike a mountain of light (*the signification of koh-i-noor*), but are confident that they will strike silver in the mountain, and that in a short time.

THERE ARE MANY OTHER MINES

In the Silver Mountain district which are now being worked with a will, but to describe them all would make this communication too long. The hard times have operated, as medical men would say, as a prophylactic—it has shown that the true remedy for hard times is to work harder. There is no truer saying than that "God helps those who help themselves." The people in Alpine county are fast finding it out. They are all, for the time, it is true, troubled with a scarcity of money; but the present indications are, that, before long (say two years), many will be troubled with a surplus. But "man is born to trouble," and the best way is to meet it with a bold face. It is to be hoped that when troubled with a surplus of the root of all evil, man will bear it with Christian fortitude and resignation. I have told you but little of what they are doing in Silver Mountain. In Raymond, Monitor, Mogul and Webster counties, the motto of the miners is, "never say die." H. E.

Mechanical.

Titanium Iron.

A valuable discovery is reported in the English papers, which consists of a cheap process for smelting titanic iron ore, which has hitherto defied, or greatly perplexed, all ironmasters and scientific men in the trade. It is a well-known fact that iron made from titaniferous ore is most valuable, on account of its hardness and tensile strength being five times greater than ordinary iron; this iron will be admirably adapted for plating on iron-clads, and also for rails, on account of its hardness and strength, and the discoverer will be prepared to test this iron against any other iron hitherto discovered for these purposes, or for making steel. If the discovery is one which can be cheaply introduced, or one by which titanium iron can be manufactured at about the cost of Bessemer steel, it will be a valuable one indeed.

A company has recently been formed in England for the manufacture of titanic steel and iron after the mode devised by Mr. Masbet, which, we believe, is nearly ready to go into operation. We perceive from the London *Mining Journal*, last received, that an extraordinary general meeting of this company has been called, to take into consideration the agreement entered into by the company with Messrs. Mushet & Clark, with a view to the modification thereof. This may possibly have some reference to the new discovery above spoken of. At all events, there is a good reason to believe that the well-known and valuable properties of titanium will soon be economically introduced into the manufacture of iron, in such a manner as to work a most important improvement in this great agent of civilization and practical mechanism.

GOOD MORTAR.—Many have supposed that the superior endurance of masonry over modern masonry is due, in a great measure, to some secret in the art of making the mortar used by the ancients. Analysis, however, shows that there is nothing remarkable in the composition of the mortar used by either the Greeks, Romans or Egyptians. The inferior quality of modern mortar is due to the dishonesty of builders and contractors, and the haste with which it is applied after being made. What is essential in good mortar is *thoroughly* burnt lime and clean sharp sand in the proportion of one of lime to two of sand; sand mixed with mud or slum won't make good mortar. Moreover, the lime should be slacked as soon as possible after burning, before air-slack begins to set in to any extent. Care should be taken that no more water is used in making mortar than is necessary to work it. The mortar should be well worked, and after being made should be kept as much as possible from the air, by a covering as nearly impervious as possible. It is said that the Romans, for their best work would not use mortar that was less than two or three years old, and which had been kept moist in pits. Before being used, it should be thoroughly re-worked. Care, in these two last particulars will add much to its hardening properties, and of course to its endurance. Some ancient mortar is as hard as the stone which it binds together.

HYDRO-PROPULSION.—In an article in the *Engineer* upon the new propeller Waterwitch, the editor says: "The first patent for hydro-propulsion was secured by Togood, in 1661, and his boat was tried on the Thames; since that year fifty-seven patents (English) have been taken out, all embodying more or less exactly the principle used by Mr. Ruthven."

ENGINE CHRONOMETERS.—Owing to the excessive shaking experienced on the foot-plates of locomotives, it has been hitherto a matter of extreme difficulty to obtain engine chronometers which will keep correct time, but this difficulty, it is reported, has been surmounted by Mr. Lewis Hasluek, who has supplied the Metropolitan Railway company with a chronometer fixed to an engine, the fifteen days' trial of which has been most satisfactory.

Welded Boiler-Joints.

During the past few years many efforts have been made to do away with the lap and rivet system of joining boiler-plates; one great objection to the system of riveting being the corrosion of the plates on the interior of the boiler, where the line of rivets join the plates together. When boilers are made of a single plate bent into a circle and having only one longitudinal riveted joint it is some improvement, as it does away with the longitudinal laps that occur in the lap and riveted boilers built up of sectional plates. This may be called the first step in the improvements in boiler working, and seems a sensible one that ought to have been adopted when the manufacture of boilers first commenced. But until the time shall come when we will have seamless boilers of steel, rolled like a tube upon the machinery that "is to be" in the future of mechanical skill, we are content to use the old style of lap and riveted boilers.

We find in this style of boiler two evils to contend with; corrosion of the plates by a chemical action, and corrosion and mechanical action combined. The first occurs in various parts of the boiler, and we find the surface of the plates irregularly pitted. But the last-named evil occurs along the line of the laps, both the longitudinal as well as the transverse joints, and occurs mostly below the water-line. Corrosion, it is true, can be accounted for by chemical principles; but when we find annular grooves running parallel or in the immediate vicinity of the riveted joints, we must look to some other cause, and must attribute it to the effects of heat upon the joints, and to the combined effort of mechanical and chemical action. We will suppose that a chemical action has commenced equally over the interior surface of the boiler; we find that the effects of heat upon the plates will be such that there will be unequal expansion where the laps occur; perhaps this may be accounted for in consequence of the plates not being in the same line of strain, and as the contraction is succeeding expansion, the deposit of scale induced by corrosion is cracked and broken off. This lays the surface open to a similar succeeding action, which, in process of time, forms an annular groove, that destroys the strength of the plate at this point. The corroding action of the water upon the plate is quite weak compared with the action that goes to form these annular grooves.

Upon locomotive boilers this evil is much greater than in the stationary boiler, and for this reason; the different supports and braces of the boiler are rigidly made, and they offer a great resistance to the expansion and contraction of the boiler, which has a greater tendency to throw off this scale and present new surfaces for corrosion than in any other kind of boiler. The system of forming boilers of a series of hoops or loops, with but one riveted joint, overcomes part of this evil. Another plan has been used, with some success, of rolling the plates with the customary thickness of body, the edges tapering with a gradual thickness, by this means insuring an equal springing of the plates instead of the concentration of force acting upon them at a single line. In this mode there is a gain of strength where the lines of riveting occur, as the loss of metal consequently weakens the plates by the series of rivet holes, but is compensated for by the additional thickness. It has been shown by actual experiment that boilers constructed upon this plan have been successful; no annular grooves being formed by corrosion consequent upon the mechanical action.

Welded longitudinal joints have been made with a fair prospect of success; but there is but little prospect of their ultimate adoption. In all experimental boilers of this kind that have been made, the weight was greater and the expense much more than any other kind of boiler. Instead of adopting *heavier* boilers, we are continually looking for a boiler that shall be lighter as well as cheaper, and combining the same amount of strength.

The great want seems to be a boiler that shall be light, constructed of Bessemer or some kind of steel that shall be perfectly homogeneous—made seamless, perfectly cylindrical, and of length or diameter to order.

When we call to mind the improvements made in steam hammers, and the huge forgings that are formed by their aid; the rapid improvements made in the manufacture of wrought iron tubes, can we not look to the future as producing boilers made in this manner and upon these principles? It may be of no greater difficulty in the future than the making of iron tubing has been in the past. Where there is a demand, or where a demand can be created, *there* genius will find a means to supply all that is needed or called for.—*American Artisan*, Nov. 21.

A new English "safe-protector" is an arrangement by which any violence to the safe, even a blow upon the top, will cut off the supply of gas from a peculiar lamp in the street in front of the building. This would not once draw the attention of the watchman.

Scientific Miscellany.

Wilde's New Magneto-Electric Machine.

The October number of the London Quarterly *Journal of Science*, contains a further description, with illustrations, of Mr. Wilde's new magneto-electric machine. Like most practical applications of science, the important results which Mr. Wilde has obtained, depend more upon an ingenious combination of several well-known facts, united with considerable scientific and engineering skill, than upon any new and striking discovery in the science of electricity. The principle of the machine was quite fully and distinctly set forth in our issue of December 15th.

The value of the discovery is beyond question. The consideration of its economical applicability at present, seems to be confined to the production of light. The extraordinary calorific and illuminating powers of the apparatus, are certainly most astonishing. The great advantage derivable therefrom, over the old system of magneto-electric machines, consists in its capability of amplification to seemingly any required power, by the mere enlargement of the size of the different parts, and the continuation of the electric current generated round a still greater number of electro-magnets. The only apparent limit to this multiplication of power, is the excessive heat evolved. It could be increased until the heat would destroy every material of which the apparatus could be constructed, burn up the wood work, melt the iron and brass, if, indeed, it did not previously result in the more sudden catastrophe of a mighty explosion, spreading death as well as desolation around. A machine might be constructed and safely worked, which would light up such cities as San Francisco, and make our night as bright as day.

A writer in the *Journal of Science*, while reflecting upon the extraordinary results obtained in the evolution of such an enormous electrical force at the expenditure of such apparently small mechanical power, cautiously remarks as follows: "But, without for a moment denying the truth of this doctrine, [the modern doctrine of the conservation of force] it must be admitted that there are certain phenomena connected with this, which are in apparent contradiction to the law of conservation."

The first practical application of the invention, and one which possesses a considerable degree of interest, has been made by a photographer. For such purposes it is found more convenient, and even more effective, than the sun itself. By the aid of one of Mr. Wilde's machines more than two hundred negatives can be exposed in a day to secure gelatine reliefs. Its constancy and perfect control renders it far more valuable than an uncertain sunlight.

A large machine is now in process of construction for a first class lighthouse, that will weigh, when completed, about three tons, and which without reflectors will produce as much light as 4,000 wax candles, at an expense not exceeding, if it even equals that of oil or gas, for a light of ordinary intensity, equal to, say 1,000 wax candles. The amount of coal, per hour, to keep up the mechanical action of the revolving armatures, necessary to cause the machine to blaze forth with an intensity of light, before which even the rays of the sun himself appear pale and feeble, will be less than twelve pounds per hour! To the above must be added the expense of carbon rods for the lamps, which will be about ten inches per hour, worth perhaps two or three cents—and the somewhat increased expense of interest on the original cost and a little extra care for tending the motive power, etc.; but no more necessary cost.

Time has not yet sufficed to determine but few of the uses to which so convenient and useful a light may be applied; or to the other economical purposes which it may yet be found to subserve in some one of its convertible forms of light, heat or motion. The purely scientific interest of the discovery has as yet

been scarcely considered. Philosophers and experimentalists of all classes, will doubtless seize upon the discovery and amplify it, by repeating and extending their researches into dia-magnetism and the magnetic condition of all matter. We shall watch with much interest for future developments, and shall place them before our readers as fast as they transpire.

THE MAGNESIUM LIGHT—A NEW MODE OF OBTAINING IT.—A new magnesium lamp has been devised in England, by which that metal is burned in the shape of a fine powder, instead of the ordinary ribbon. The metallic powder is mixed with fine sand as a diluent, instead of the metallic alloy as heretofore employed in the form of a strip or ribbon. The powder is placed in a reservoir of suitable size, with a short tube at the bottom through which it flows to a small gas jet issuing from the same orifice, and by which it is kept in a constant blaze. The flow is regulated by a valve, the same as in the use of gas. At the first *soiree* at which these lamps were used, the ladies complained that a ghastly effect was produced upon the countenance, by the effect of the burning magnesium. At the next *soiree*, the defect was ingeniously obviated, and a most pleasurable change effected, by the addition of a little nitrate of strontia to the magnesium powder; the result of which was the communication of a warm roseate hue to the light, which produced a most pleasing effect upon the complexions of the persons present. The ladies, especially, were delighted with the ingenious contrivance, and expressed the utmost satisfaction at this new evidence of the value of science in devising ways and means for beautifying the human complexion.

TRANSMISSION OF SOUND THROUGH WATER.—It is a singular fact that musical sounds, however loudly produced, rapidly become extinct in their transmission through water. For instance an iron bar, suspended perpendicularly in the air, and struck anywhere along its length produces a musical sound which is heard to a great distance—much further than when it is suspended longitudinally and struck against one of its ends. The exact reverse of this is true when suspended in the water. These facts have an important bearing in the transmission of fog signals, when musical notes cannot be heard at so great a distance as those which are not musical. Extensive experiments in this direction are being made in England, with regard to the character of sound which will pass the most readily through water or an atmosphere loaded with fog.

INDIUM IN ZINC OVENS.—Dr. Rudolph Wagner has ascertained that the rare metal indium is often to be met with in the fumes of any furnace where zinc blende has been roasted. The fact is worth bearing in mind, and it would be well for any parties who may be roasting ores containing any considerable quantity of zinc, to have their fumes or the dust from the same carefully examined for this mineral, by some competent chemist.

PURE BENZOL.—To prepare perfectly pure benzol, Schorlemmer recommends the treatment of the crude mixture of hydro-carbons with bromine, and subsequently with potash before rectification. In this way a product is obtained which gives a nearly colorless nitro-benzol, and dissolves in concentrated sulphuric acid without much coloration.

GLACIER ICE.—M. A. Bertin has recently examined the constitution of glacier ice by polarized light. He has found that the superficial part of the higher glaciers is composed of agglomerated snow; but lower down, where the water has sunk into the fissures and become frozen, crystallization and true ice are found.

THE COLOR OF VARIOUS LIGHTS.—The diffuse light of day is strongly reddish, just as gas or lamp light is yellow. The only perfectly white light is the electric light from charcoal points. The light from burning magnesium, as well as that derived from the combustion of phosphorus in oxygen, is violet.

WEEKLY STOCK CIRCULAR

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,
December 29, 1886.

MONEY MARKET.

The money market presents no new feature of special mention. The demand for legitimate business purposes is very fair, and there is no lack of available funds in the banks and other places of deposit; in fact, the accumulations are larger at present than for some time past. A considerable amount of first class paper is now negotiated at 1 per cent. per month; however, most discounts are made at 1½ per cent., with occasional transactions at 1½.

Bullion is not in large supply, and the amount at command for shipment is comparatively light. Gold Bars are scarce and obtain \$80@87½. Silver is selling at ½ 4½ ct. premium for fair grades.

Sight Drafts payable in coin are selling at 2½ 4½ ct., and Currency Bills on the East are offered at 25 4½ ct. premium on gold. Telegraphic Transfers are made at 2½ 4½ ct. premium. Sterling Exchange sells at 48½@49½d, and Commercial Exchange at 49@49½d.

The duties paid at the Custom House in this city, from January 1st to December 27th inclusive, amounted to \$7,144,465.98. The receipts of Treasury from the interior during the current month aggregated about \$3,500,000.

The rapid decline of Gold during the past two weeks seems to have retarded any speculative movement in Legal Tenders in this market, most holders being confident of a still further rise. Our latest advices from New York quote Gold at 132. Legal Tenders are selling here at 75½. A small amount of June 7-30s obtained 76½.

CITY STOCKS.

City Stocks are not in much favor at present, and during the past week transactions in these shares have been lighter than for a long time past. California Steam Navigation Company sold at 64 4½ ct., and Sacramento City Bonds at 20 4½ ct. Insurance Company shares are freely offered, but obtain no purchasers at quotations. The recent withdrawal of some of these institutions from the rules and regulations of the Board of Underwriters, and their determination to materially lessen the rates of insurance, occasions a feeling of uneasiness on the part of holders.

In order to obtain some idea of the amount of money disbursed in the form of dividends in this city by various incorporations during the present month, we have made the following compilation:

The Bank of California, 1 3/4 ct. on \$5,000,000—	\$250,000
California Navigation Co., 2 1/4 " 2,500,000—	60,000
Spring Valley Water Co., 1/2 " 6,000,000—	30,000
San Francisco Gas Co., 1/2 " 6,000,000—	30,000
Omnibus Railroad Co., 1/2 " 1,000,000—	5,000

Total, \$345,000
Add Sacramento Gas Co., 1/2 ct. on \$500,000— 2,500
And Silver Mining Co. dividends, say, 340,000

We obtain a total of.....\$507,500

which we may almost consider as a local disbursement of net earnings during the current month. We are informed that the Central Railroad Company recently paid a dividend, but the amount disbursed we have been unable to ascertain. North Beach and Mission Railroad Company paid no dividends in November and December; previously they declared ½ 4½ ct. per month on the capital stock.

In reference to the receipts of the several City Railroad companies, from December 1, 1885, to November 30, 1886, a period of one year, we present the following figures:

Omnibus Railroad Company.....	\$238,105
North Beach and Mission Railroad Company.....	195,310
Central Railroad Company.....	127,018
Front Street Railroad.....	39,284
Front Street, M. & O. Railroad Co., from May 1 to November 30, 1886.....	27,619

Total City Railroads.....\$627,316
S. F. & San Jose Railroad..... 606,149

Making a total of.....\$1,233,465

MINING SHARE MARKET.

The stock market has been characterized by considerable activity this week, if we take into account that this is the holiday season of the year; a few leading stocks, however, fluctuated more than usual, and closed at a decline from quotations in our last issue. Other shares have commanded uniform prices, showing a very slight change from sales during the previous week. Shares of fourteen different mining companies constituted this class of transactions during the present week.

HALE & NORCROSS—has not been inquired for during the past week. We quote it at about \$2,500 bid. This company is opening a station at the base of the 780 foot level, and have suspended work in extracting ore for a few days for this purpose, and also to repair the car tracks in various portions of the mine. They report a large amount of ore on hand.

SAVAGE—obtained a considerable degree of activity at the close. The stock sold early in the week at \$1,952.50, improved to \$2,110, seller 30, then receded to \$2,070, and at the close \$2,125 is asked. During the week ending Dec. 22d, this company mined 1,245 tons of ore; previous week, 1,893 tons. Of the 1,245 tons of ore extracted during the week under review, 119 came from the Curtis shaft, valued at \$46 per ton, and 146 tons from the sixth and seventh stations, worth \$72 per ton—both second-class grades of ore, the remainder (980 tons) being third-class, and valued at \$30 per ton. The accumulated ore at the mine amounts to 2,135 tons. The mine continues to look well, and we learn of no special changes at this time. The bad condition of the roads and the inclemency of the weather had prevented the teams from hauling ore to the mills for several days. The receipts of bullion during the current month, it is thought, will be fully as large as the November returns.

YELLOW JACKET—was in the market to a large extent, opening at \$1,300 buyer 10, improving to \$1,305@1,310, dropping to \$1,250 on Thursday, on which day 80 feet were sold, and closed yesterday at \$1,200. From December 1st to the 17th, this company extracted 5,163 tons of ore, of which 10½ tons were first class. The yield of Bullion during the same period is stated at \$62,148.36. It is estimated that the receipts of the present month will aggregate \$275,000. In regard to the recent developments we have been informed that in the south mine, lower level (500 feet), two extensive strata of fine ore have been found.

CROWN POINT—has been well maintained at an advance from sales of the previous week, selling at \$1,250@1,262.50, then at \$1,250, and at the close \$1,190 was bid. During the week ending the 21st inst., 985 tons of ore were taken from the mine; previous week, 891. The sinking of the shaft from the 400 to the 500 foot level is expected to be accomplished in 35 days from the first of January next. The receipts of bullion from the 1st to the 19th instant amounted to \$75,000.

GOULD & CURRY—sold at \$700 early in the week, then at \$690@700, receded to \$670, and at the close \$675 was asked. The annual meeting, for want of a quorum on the 27th, was again adjourned to January 15th, 1887.

CHOLLAR-POTOSI—has been active and 318 shares changed hands, opening at \$215, advancing to \$230, gradually receding to \$218@216, and closing at \$208. During the week ending December 22d, 820½ tons of ore were forwarded to custom mills. The winze from the first station, new shaft, is now down 25 feet. The quartz has given out, and they are now sinking in clay and porphyry. No change worth mentioning in other portions of the mine.

EMPIRE MILL—rose from \$192.50 to \$205, and at the close sold at \$210....IMPERIAL opened at \$138@140, receded to \$127.50, and closed yesterday at \$130. This company realized \$15,000 in bullion from the second clean up in the present month....BELCHER advanced from \$131 to \$138, then sold at \$132, and closed at \$132.

OPHIR—was quite actively dealt in, advancing from \$163 to \$172.50, dropping to \$145@140, and closing at \$134. On the 24th inst. the trustees of this company levied an assessment of \$5 per share, or \$60 per foot.

CONFIDENCE—gained a good degree of activity toward the close of the week, selling on Monday at \$81, declining to \$75.50, and then to \$70, and at the close sold at \$67....OVERMAN was comparatively quiet, selling within a range of \$16.25@18, closing at \$17 seller 30.

ALPHA—sold early in the week at \$100@110, then at \$150. At the close \$125 was bid....BULLION realized \$7, then \$24, assessment of \$10 delinquent....SIERRA NEVADA rose from \$2.50 to \$5, receded to \$2.75, and closed at \$2.75. The annual meeting of this company takes place on the 14th of January, 1887.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$617,612.75.

Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD

Saturday, December 22.

12 shs Ophir at 164 per foot, s 5.
12 shs Ophir at 165 per foot, s 5.
12 shs Ophir at 172½ per foot, b 30.
276 shs Ophir at 162½@165 per foot.
168 shs Ophir at 163@167 per foot.
10 shs Sierra Nevada at 2½ per share.
12 shs Alpha, G. H., at 100@110 per foot.
4 shs Gould & Curry at 700 per foot.

INNOVANT MINING AGENTS.—The American Journal of Mining publishes a letter from Richard Ogden, of San Francisco, in the course of which he says: "There are good chances here yet to invest in good mines that we have not means to develop, but you must use ordinary business precaution and judgment in investing, and not go it blind. Don't send out, as agents, boys and men who don't know granite from slate. I know of a 'practical miner' here who spent a quarter of a million on a Reese River mine, who did not know what the word 'auriferous' meant, and when I showed him a piece of brick hat he thought it very fair rock."

THE SUTRO TUNNEL.—We learn that there is now evident a disposition to take stock in the above named enterprise, on the part of the mining companies whose claims are situated on the Constock Lode. This is as it should be. There could be no better proof that these companies are satisfied not only that the work will be of incalculable benefit to their claims, but that the stock will be desirable as a speculation. Those who have read the pamphlet which Mr. Sutro has published, can conceive of the immense prospective revenue of the company.

AGGREGATE BULLION FOR 1866.—The aggregate of bullion assayed during the fiscal year of 1866, as per official returns, was \$81,389,541. Of this amount, \$73,032,805 was assayed in the Pacific and Rocky Mountain States and Territories. The remainder was chiefly in the Atlantic States and on the seaboard cities. It is estimated that 25 per cent. of the gold product escaped assayment.

THE SUTTER TITLE.—The Sacramento Bee says that, with the exception of its accompanying map, the United States patent for the land claimed by John A. Sutter has been recorded in the Sacramento County Recorder's office. The work was completed on Monday last. The patent has also to be recorded by the Recorders of Yuba and Sutter counties.

GOLD IN GEORGIA.—The Atlanta Intelligencer speaks of having seen a pound of "dirt from a lot of land in Lumpkin county," washed by the "pan process," which yielded at the rate of \$500 to the ton. The sample tested was "from a larger quantity taken promiscuously from a vein averaging six feet in breadth"—probably decomposed quartz.

LOWER CALIFORNIA COLONIZATION SCHEME. The association representing the interest of this colony in San Francisco, have divided the capital stock into 3,000 shares, each of which contributes toward the expenses for entitling a portion of the colonial lands, its proportion of sixteen dollars, in full of all assessments. A number of these shares will, for the present, be issued free of extra cost to applicants. The land and town sites will be sold for the benefit of all shareholders.

NATURAL CURIOSITIES FOR CHRISTMAS.—At No. 522 Pine street, E. F. LORQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shell and Wax Flowers, besides Feathered Birds and Butterflies, for ladies' hats, Shells, Sea-weeds, etc.

THE MINING AND SCIENTIFIC PRESS. of San Francisco, comes to us this week printed on the loveliest white paper, and only seventeen days old. It is the best mining journal in the country.—Colorado Journal, Dec. 4th.

Endorsement by the Miners' State Convention

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requirements of the Department, and properly filed all necessary papers in Claim Agents.

Postage.—The postage on the Mining and Scientific Press to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

MINING SHAREHOLDERS' DIRECTORY

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location, Amount of Assessment, Date of Meeting, Day of Delinquent Sale, and Amount and Time of Payment of Dividends.

Blanks, Blank Mining Books, Constitution and By-Laws

—FOR—
Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the Mining and Scientific Press.

Orders from the Interior faithfully attended to.

Job Printing Press for Sale—\$250.

A Largest Size (half medium) RUGGLES' BEST JOB PRESS, in fine order and good as new, can be had for \$250, cash—lowest price. Warranted. Apply to
DEWEY & Co.,
Mining and Scientific Press Office.

VOLUME TWELFTH.—The Mining and Scientific Press with its last issue, commenced its twelfth volume. Since Dewey & Co. have "held the ribbons" its gain has been rapidly toward a perfect journal. Its appearance evidences its prosperity, but doubtless, like some of the rest of us, it can stand increased encouragement. Let such be given, and our word for it, volume thirteen will acknowledge receipt.—[Golden Era.]

To Miners and Families Living in the Country.

DR. BOYNTON'S MEDICINE CHEST, is put up in San Francisco expressly for the use of families, and consists of a chest of moderate dimensions, neat in its appearance, containing those household articles, simple remedies, that families always feel like keeping on hand for immediate and common use, and a book of brief instructions, describing their use.

The object in preparing this Chest was not to make doctors, but for the simple purpose of nursing; hence, a majority of the remedies were such as are familiar to nearly all who are advanced in life, and the book is simply a representation of those plain truths relating to the department of the nurse already set forth in more extensive works. It was the object, not to say many things, but to say few things—to simplify and make plain for common use. And in selecting the contents of the Chest, the object was not to set forth something new and wonderful, but those of old and acknowledged worth.

In view of the above facts, physicians have everywhere encouraged the circulation of this chest in unmistakable terms. They recognize the fact that families do not, will not, need not call on them on the occasion of every slight derangement or infirmity. They do not and cannot deny the fact that such obligations of homo care rest upon heads of families.

The book gives a description of nearly every medicine in the collection, their use, and their component parts, so that every person may know what he is receiving into his stomach or applying to his person. This openness and frankness is regarded by the best practitioners, and all considerate persons as justice, more than policy. The universal conviction of the more thoughtful is, that that which relates to our health and physical well-being in this life should, above all things, be known, and not kept in the darkness of secrecy.

In introducing this chest in the country, we always first submit it to the criticism of practicing physicians, and feeling the importance and seeing the necessity in this sparsely settled country of home-nursing, and seeing the adaptability of this chest, physicians in San Francisco, Sacramento, Stockton, Knight's Landing, Cacheville, Marysville, Colusa, Oroville, Lodi, Lincoln, Folsom, and Auburn, have given it their hearty sanction. Seeing the necessity on this coast of people relying upon themselves in such matters, physicians in this State have remarked: "If I could choose but one for a family, I would every time choose the nurse instead of the physician." "If families would get a collection of simple remedies, with plain instructions for their use, they would do away with half the doctoring." "All families should possess themselves of a collection of common remedies, with plain instructions for their use." "I would like to see the chest in every family." "It is a convenience"—"it is useful"—"much sickness and much expense might be saved by such home care."

We subjoin the following statistics from Sutter County, California:

"The undersigned have had Dr. Boynton's Medicine Chest in their families for the last few months, and willingly state that they regard it as a wise provision, strictly practical and highly useful."

Every person having the chest in the above named county has signed the above article. The publishing of the names being unnecessary, we withhold them and save space.

The undersigned have known Dr. Boynton's Medicine Chest for the last few months, and regard it as a wise provision, and highly useful in every family. The medicines being put up with instructions, its utility, convenience, and great economy are unquestionable.

Signed by Judge HURLBERT and 45 others.

STATE OF CALIFORNIA, } ss.
County of Sutter,
I, C. E. WILCOXEN, County Clerk in and for said County, hereby certify that I am personally acquainted with a majority of the individuals whose names are subscribed to the foregoing certificates, and that they are good and substantial citizens of said county.

Witness my hand and official seal this 27th day of [L.S.] December, A. D. 1865.
C. E. WILCOXEN, County Clerk.

Agents wanted in every County to sell this Family Chest. Their compensation will be a liberal commission on all sales. The Agent should be a resident of the district which he is to canvass, and accompany his application with good references, and of this city if possible.

We can give further particulars when desired. All letters should be addressed through the post office, to
E. NORRIS,
1213 Clay St. San Francisco.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the Mining and Scientific Press.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County—

From the *Miner* of Dec. 15th: The Empire Mill and Mining Company paid a dividend of \$15 per share last Saturday, and carry forward a surplus of nearly \$18,000. Within the past ninety days they have taken from the mine about 7,500 tons of ore—on an average of eighty tons per day, and have now at their dumps and at the mill some 3,000 tons. A winze has been sunk to the depth of twenty feet on the vein lately struck in the 700-foot level, with fine prospects of a valuable supply of ore.

On Saturday last the stockholders of the Leviathan Gold and Silver Mining Company met pursuant to call, and by unanimous vote sold to E. Arnold all the stock standing in the name of the company. Mr. A. purchased for an Illinois company, and a large majority of the stock being now in his hands, the management will be in their control, giving them a fair chance to go ahead and prospect the mine without "let or hindrance."

From same of 22d: We visited the Washington mill on Tuesday, and we were well pleased with all we saw. Only a portion of the works were running at the time, the stamps were pulverizing ore for the first working, and the furnaces drying salt and tailings to mix with the ore in roasting.

From the *Silver Mountain Bulletin* of Dec. 15th: A body of rich ore was struck in the second gallery of the George Washington mine, during the latter part of the past week, that will yield \$1,000 per ton.

Mylett & Co. cut through the ledge in the Del Monte claim on Tuesday afternoon, exposing a pay vein of ore five feet in thickness—every piece of the quartz exhibiting ruby silver freely. The ledge at the present depth of the shaft (thirty feet) has a slight dip to the west.

The contract for running the tunnel in the I. X. L. has been awarded to H. Jardine and R. K. Love. They will commence work on Monday.

Calaveras County—

From the *Chronicle* of Dec. 15th: Mining intelligence from the Whisky Slide District continues most favorable. By Matthews, of Foster, Matthews & Co., we are informed that in the bottom of their shaft, which is 112 feet in depth, they have struck ore of remarkable richness. This claim has been thoroughly prospected, rock having been taken out of the shaft in a number of places and tried, both by assay and working process, and in no instance has it shown less than twenty-five dollars per ton. It is a solid, unbroken vein of gold-bearing quartz, six feet in width.

Colusa County—

The Lyon Company has erected works for smelting copper at a cost of \$10,000, and commenced operations. The breaking of the fly-wheel will suspend operations for a few days.

El Dorado County—

From the *Placerville Courier*: The number of men seen daily wending their ways, with picks and shovels on their shoulders, toward the various ravines and gulches surrounding the city, would seem to cast some doubt upon the assertion that the surface mines in this neighborhood are worked out. True, the times for taking out one, two and three ounces per day to the man are past, but many persons find sluicing the most remunerative pursuit to which they can turn their hands, even where something less than an ounce a day is the average yield; consequently, since the rains have commenced quite a revival of active picking has taken place in claims formerly deserted.

Mariposa County—

From the *Gazette* of Dec. 22d: We learn that work has been resumed on the Princeton Mine. The reason given for the suspension of operations for so long a time is, that the late holders would not go to the expense of working without an immediate return. The present company are more plucky and likely to meet the reward they so well deserve. The old pillars are being removed, and work is in active progress. We are informed on reliable authority that the mine is now paying from fifteen to thirty dollars per ton, and there is enough rock in sight to keep the men going for the next six months.

The *Sonora Democrat* says that Messrs. McGee and Flanagan, whose mining claim is located near Coulterville, a few days ago came across a quartz boulder in their claim from which they pounded out one hundred and fifty ounces of gold.

Mono County—

Letter from Benton to the *Aurora Union* of December 15th says: On arriving here I found Dr. Partz's reduction works in "full tide of successful operation." The furnace was kept at work some twelve days without a stop, turning out bullion by the ton.

Returns have just been received of the ore sent to San Francisco from the Rockingham lode, which sold there at six hundred and forty-seven dollars per ton. Another shipment from the same mine left here yesterday. The Merrimack is another rich ledge, thought to be equal to the Rockingham. Then there are the Camanche, Bureka, Kearsarge, and many others that I cannot now name, all looking well and improving every day they are worked. The Diana company have sunk one of their shafts to a depth of one hundred and twenty feet, taking out enough as they sink to keep their mill running almost constantly day and night.

Nevada County—

From the *Gazette* of December 19th: The Homestake company, who have been engaged for some time in running a tunnel for their ledge, at Myer's Ravine, struck the vein yesterday, and feel quite encouraged with the prospects. John Murphy, one of the owners, showed us some fine looking specimens from the ledge last evening. They have cut into the ledge about two and a half feet, but have not yet got through it.

From same of 20th: We were shown, yesterday, a rich specimen from the Wild Irishman ledge, situated near the head of Mud Flat. At a depth of thirty-five feet the ledge is two feet in width, and the rock shows free gold in abundance.

Same of 21st: The mill of the Eagle Gold and Silver Mining company, situated at Devil's Canon, in Enreka township, has made its first run on rock from the Grizzly ledge. We learn that twenty tons of rock crushed yielded twenty-one ounces of retorted gold, assaying something over seventeen dollars an ounce, and giving a yield per ton of eighteen dollars. The ledge where they are now getting rock is about two and a half feet in width. The company have eight ledges in the vicinity, which are known as the Grizzly Group. The mill has only five stamps at present, but more will be put in when needed.

Same of 24th: Mining operations have commenced in earnest at Scotch Flat; Bean & Co. commenced hydraulicizing day before yesterday, and the claims of Morrow & Co., Jacobs & Sargent, Cobb & Co., and Ashburn & Co., were started up yesterday. These companies have had every thing prepared to turn on the water as soon as they were satisfied of a permanent supply, and it is calculated that the amount of mining this session in that locality will exceed all that has been done heretofore.

The editor has recently visited Grass Valley. We give the summing up of his observations. The Empire mill has stopped a week for repairs. . . . The Henston Hill company is taking out very rich rock. The last crushing of rock taken from the north end of the level yielded \$170 a ton; and from the south end the yield was \$100 a ton. . . . The Union company—Findley & Co.—are yielding twenty-five tons a day, the daily yield being \$800 to \$1,000. Cambridge is crushing eleven tons a day, and last week cleared up 450 ounces of amalgam—the rock averaging \$43 a ton. The Lucky company are running their mill steadily, and doing well. Ophir is now down with a shaft 200 feet, and has struck a "stringer," which has been cut into eight feet, and they are not yet through it. The Allison Ranch company are running drifts and opening new ground. At present they employ only forty men, but will soon be working their usual force. The New York Hill company have 450 tons of rock ready for crushing, and will run it through the Rocky Bar mill. They are now down 460 feet on the incline.

Same of 26th says, that although one or two quartz mines in the vicinity were flooded by the storm, no flames had been blown down or any other special damage done. Miners were better prepared for a storm than heretofore.

From the *National* of December 21st: This morning a gentleman picked up a specimen, worth some \$10 or \$12, on Main street, just above our office. He imparted the information of his good luck to several of his friends, and in an instant the news was all over town. In less than an hour's time the whole of Main street, from the "Willows" to Dunk Wood's ranch, was staked off into claims. However, "nous verrons."

From the *Transcript* of December 21st: A short time since a rich lead was discovered by Mr. Arrington, near the Tecunsech mill, about four miles above Washington. Mr. Arrington recently moved into a cabin near the mill, and was engaged in prospecting a ledge in the vicinity. He noticed the croppings of a lead near the house, upon which he sunk a short distance, when he found a well defined lead about four feet in thickness. The quartz is of a milky whiteness, and contains a large amount of free gold. It is one of the most promising ledges that has been found upon the Yuba for a long time, and is located where the workmen at the mill were in the habit of passing three or four times every day. The ledges in this vicinity are in the same range as those at Enreka.

The *Union* of 16th says of the Cambridge

mine: The yield of amalgam from the crushing of last week, from Monday to Friday, was over three hundred ounces, and the rock averaged thirty-five dollars per ton. The ledge is of a good width, showing beautiful free gold, fine looking sulphurets and plenty of galena. Rock is being taken out in sufficient quantities to keep the Cambridge mill running night and day for some time. The Cambridge, according to present indications, is good for four hundred ounces of amalgam per week. It is on Howard Hill, one mile and a half west from Grass Valley.

Excelsior.—From the *Sun* of the 15th of December: The work on several of our mines goes bravely on. The Mohawk and Montreal company are taking out an abundance of good pay ore from their second level. The California company are still sinking their shaft near the Knickerbocker ledge, and a number of other companies are prosecuting their labor with untiring perseverance.

Placer County—

From the *Herald* of Dec. 22d: A friend informs us that Mr. Harpending has recently sold the "other half" of the Banker mine for \$225,000 in gold. This makes \$450,000 for the whole mine.

The erection of the quartz mill on the St. Lawrence claim, near Ophir, is being prosecuted with vigor. The owners think they will be ready for work by Christmas.

Capt. Holdrege has issued hand bills for bids to sink an incline shaft, of 25, 50, or 100 feet on the Conrad Ledge. His address is the American Hotel, Auburn.

The late storm will prove a rich harvest for the miners. All the ditches and ravines are running full of water, and the miners are starting in to work with a will—the result will be a golden harvest for California, and thousands of dollars will be taken out.

From the *Stars and Stripes* of Dec. 19th: The New Mexico claim is located about one-fourth of a mile from the Mount Pleasant House. An incline shaft has been run on the ledge to the depth of twelve feet. The ledge is fifteen inches wide. From a crushing of nine tons of rock, a bar of gold weighing five ounces, was obtained. The nine tons of rock contained about five hundred pounds of sulphurets, which were not worked, nor were the blankets cleaned up after the crushing. Work on the claim has been suspended until spring. The estimated value per ton of the rock if carefully worked, is about \$25. An extension of the New Mexico called the Savage, has been located. The two companies will go to work in a few days, and for the purpose of prospecting the ledges will sink a shaft 100 feet deep on the line of the two claims.

Plumas County—

From the *Union* of Dec. 15th: The mining companies at work in the old Elizabethtown diggings are all doing well. O'Neill & Co., near Newtown, are also getting well paid for their work. Loonau & Co. are running a prospecting tunnel into the hack channel of the old Plumas claims. O'Neill, Cahill & Co. are ground-slucing at the mouth of "Donkey" Ravine. All the companies at Black Hawk are at work with good prospects.

At Nelson Point and vicinity, times are very dull; miners have all suspended operations in the river and creek, and are fixing up for the winter. Ellerman & Co., in their claim on High Bar, are doing well. Jackson, Jolley and Mitchell have their iron hose all laid and are waiting for water. A. F. Hardy has purchased W. V. Banner's interest in the old Richards claims. Frank Kane is doing tolerably well on Willow Creek, making good wages. White and Richards have struck good pay, on a high bar, at the mouth of Willow Creek, and are waiting for water. White and Fell have built a house near Feather River Bridge, and are making preparations to work Bowen's Bar this winter. Reports have it that Mr. Linn and one other company, at the mouth of Greenhorn Creek, took out \$25 a day to the man, last week (doubtful). I am told that Billy McKinney & Co. have struck good diggings on Jackson Creek. Now, if these reports prove true, as I believe they will, there is room for five hundred or a thousand miners in this section, and plenty of water the year round. Jackson Creek, ten or twelve miles long, has never (I am told) had a hole sunk to the bed rock, until McKinney went to work on it.

On Hopkins Creek, there is but very little work being done at the present time; the snow is too deep for outside mining. Coyle O'Neil & Co. are making good wages. Dodge & Co., at Last Chance, are doing about the same, as usual. McSheny & Co., Betts & Co., McManus & Co., and, I believe, all the other miners on the creek, are making wages, except the "Johns."

On Poorman's Creek, outside mining is suspended for the winter. Brady, Martin & Co., in Enterprise tunnel, are making from eight to ten dollars per day to the man. Baird, in the old Catvill or Kelley tunnel, has been doing well. A. Turner's claim is also paying well. Gas Whiting & Co. are running a tunnel under

the lake; these promise to be the best claims on Poorman's. Evans & Co. have started a tunnel in the hill, on the west side of Poorman's Creek, on the Blue Gravel Lead.

At Washington Hill, the American Tunnel Company have got every thing in shipshape, and in good working order. Black, in the Union claims, is taking out some good pay dirt. The boys in the Setting Sun, are driving away in their new tunnel; they are in about 300 feet and will have to run about 600 feet more.

At Sawpit Flat, everybody is at work under ground; the claims are prospecting very well; the Eagle and New York, as good as ever, if not better; the Union is also doing well. The Franklin company are running for a hack channel. The Buckeye company think they will strike through in a short time. The Monitor company have resumed operations again.

NEVADA.

Washoe—

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Gold Hill News* of Dec. 17th: The Imperial and Empire have erected a new building near their hoisting works, at the new shaft, to be used as carpenter shop until such time as the new works are put up. The work of sinking has commenced again. The new dump is completed, and adds much to the convenience of loading the wagons. This is the only mine in Gold Hill which has a self-loading dump.

An extensive and valuable body of ore is now being developed in the Yellow Jacket mine. Every ton of it, it is believed, will average not less than from \$35 to \$45 per ton, mill process—and that, too, after selecting say five tons per diem first-class ore, that will mill, by "Frieberg process," about \$300 to \$400 per ton. The upper levels in that mine also show considerable yet, left in stoping up. We were told that they hoist 150 tons of ore per diem, averaging, including "sack ore," \$40 per ton.

The Confidence mine is looking well. The ore will probably mill all the way from \$23 to \$35 per ton, and all over \$18 or \$19 per ton will be net profit. We calculate they have enough of this class of ore in sight to pay from \$10 to \$12 (one hundred dollars per foot) dividends. We understand that this month they will be out of debt, and commence paying the first dividend in January next. The prospects in the lower level are also very promising, and it is expected that as the Yellow Jacket open their 605 feet level, they will drain the Confidence, when operations in the lower level will be resumed.

From same of 18th: The Pinte Mill is being thoroughly overhauled and put in good repair. The cylinder is being bored out and new valves put in. A large amount of ore has accumulated at the mill during the stoppage, which will soon roll in bricks.

The annual statement of the Empire Mill and Mining Company shows the receipts for the past year to have been \$486,778.78; disbursements, \$452,322.51; excess of receipts, \$32,456.27. The disbursements include \$14,329.17, in payment of debts; \$32,400 in dividends paid; \$15,000 cost of mining ores; \$26,944.11, construction of Imperial-Empire shaft. The total net earnings for the year were \$121,129.55. The President in his report took strong grounds in favor of subscribing to the Suto Tunnel, saying that "the Suto Tunnel, or some similar work, must be constructed or the mines abandoned at a depth of 1,800 or 2,000 feet." The Company adopted resolutions empowering the Trustees to pledge the aid of the Company to the amount of \$15,000 in aid of the Suto Tunnel enterprise.

Reese River—

From the *Reveille* of December 14th: The Plymouth company, of New York, recently purchased three mines on Lander Hill—the Parent, Kalsced, Zimmerman & Jacobs. The work of development, which is scarcely commenced, will be entered upon in systematic style.

In the new district discovered in October by S. M. Beard, the mines included in Chihuahu Canyon have been purchased by Eastern capital, and the work is being prosecuted. A mill will be erected in the spring.

On the Florida mine, Lander Hill, the greatest depth of the incline shaft is 190 feet. The average width of the vein is ten inches. A late crushing of four and a half tons gave a yield of \$322 per ton. A subsequent one of five tons yielded an average of \$370 per ton. In one level there are in full view not less than \$15,000 worth of the same quality of ore. The property is owned by Eastern capitalists.

The same contains an eloquent showing up of the richness of the southeastern districts of the State.

From the same of 18th: The one mill at Silver Bend, and the several mining properties being developed there, employ constantly a number of teams in transporting supplies from this city. Before the close of the year a mill will be finished and in motion in the Hot

Creek District. Northumberland, Danville, Reville and Palmuagat, will wheel into line before long, with running mills and yielding mines. The prospects for a lively business for our merchants in 1867 are bright. The Reville district is attracting a large measure of the public attention, which increases as each returning party tells the tale of the mineral marvels it has seen there.

Esmeralda.

From the *Union* of December 15th: In the Juniata, ore has just been struck which will average \$40 per ton. Ore can be selected which will pay as high as \$300 per ton. The ledge is being worked at a depth of about two hundred and sixty-five feet from the surface, and is thicker than the shaft. This, we believe, is deeper than any mine that has been worked in this district, which is the most encouraging feature of the strike. The miners are still sinking and the ore is improving.

The mines in the district on Walker River are looked to with bright anticipations. From conversation with parties who have visited these mines we are satisfied that a large quantity of rich ore has already been discovered and prospected.

Humboldt.

From the *Register* of December 15th: Star City is looking up. The Yankee and American Basin companies have flattering prospects.... The Whitmore will resume operations as soon as their mill affairs are arranged on the Truckee.... The Almira has paid off its indebtedness, and an agent is on the way from New York to start work in the mine. The Sheba mill, under the supervision of J. T. Maclean, is now doing good work—running night and day—on rock from the Yosemite and other rich ledges in the East Range.

The Washington company's property has been sold to New York parties. The ledge is being stripped, and a tunnel will be at once commenced. The croppings look well.

Desert district is looking up. The Utica company has thirty men at work, cutting a ditch to get water from Humboldt Lake, and preparing to erect a quartz mill.

The Montezuma smelting furnaces are working to entire satisfaction—better than ever before. They have now been fired upwards of four weeks, and look as if they would stand the heat for that much longer, before needing new lining.

Black Rock.

From the *Virginia Union* of December 19th: Mr. Elliott left Susanville, the nearest point to the mines, on the 10th, and a special messenger has just arrived from Black Rock, bringing the joyful intelligence that the mill had made a most successful run, and yielded more "sands" than had ever been expected by the most sanguine; and so the Honey Lakers immediately got on a huge jollification, for the largest and best ledges are owned by the citizens in and about Honey Lake and Long Valley. There are hundreds of thousands of tons of this peculiar ore in sight, and if the tidings be substantiated by further returns of bullion, the richness of the country is without a parallel in mining.

IDAHO.

From the *Idaho Statesman* of Nov. 23d: A letter from Lewiston says there will be considerable mining all winter on Snake river, and on the Palouse. These mines are always open for winter work. Though they don't yield as profitably as some of the placer mines in the mountain districts, they pay fair wages, and afford employment to those who are disposed to work the year round. Good ten dollar diggings have been struck twenty-five miles from here in the direction of the Palouse, on some tributaries of that stream near the Camas ground. Twenty claims have been taken up and as many miners expect to winter there. Two men came in this week, bought grub and went back. They think the ground is much more extensive than yet prospected. Including Chinamen, there will be from 300 to 500 men engaged in mining all winter.

Letter from Rocky Bar to the *World* of Nov. 24th: Messrs. Van Wyck & Marx have finished the road from Cayuse Creek to Bonaparte Hill, and have taken in their machinery for a mill. You will hear of some big clean-ups as soon as they commence crushing. They have already found one new ledge, some 300 feet below the Bonaparte lode, which is two feet thick on the surface. Gold can be seen in all the rock.

Messrs. Green & Brown are running the Waddingham mill, and crushing rock from the Confederate Star lode. They cleaned up, after running nine days, \$9,600.

The Idaho mill will be running all winter. Their ledge ranks among the best and they always make a good clean up.

The Ida Elmore Company are taking out some very rich rock.

The Benson mill is now running at Red Warrior with good rock.

There are some three or four arastras running and all are doing well.

The Pittsburg Company are sinking a deep shaft in the extension of the Ida Elmore.

The placer diggings below the Bonaparte Hill are paying well.

Messrs. Van Wyck & Marx found two men at work near Bonaparte Hill, as they were making their road, who had accumulated some \$12,000 in gold, unknown to any one.

In Owyhee district, L. W. Greenwell has moved the More & Vass mill to the Flint district, and will soon begin upon Rising Star rock.... The Donovan and Thomas ledge has been worked to the depth of forty feet and prospects richer all the way. The vein is four feet wide at that depth.

The first extension north on the Poorman ledge, embracing six hundred feet, has been sold in New York for the sum of \$150,000. The purchase is made by a newly organized company, and instructions to commence work are expected soon.

The *World* has this Idaho City item: A careful prospect has been made of the high hills across from this city, back of Buena Vista Bar, during the last few weeks, under the direction of a company formed for that purpose, and it is now an ascertained fact that from the summit to the foot of the whole line, good pay can be realized. The work in these new diggings will be prosecuted so long as the weather will permit.

The Cosmos Mining Company has failed. The *Statesman* says a man by the name of Jones of New York, treasurer of the company, has sued for \$75,000 and attached the property. Other suits amounting to some \$17,000 had been commenced. There was great excitement in Silver City, and threats of violence towards Mr. Musgrave the agent of the company there. So much has been said in regard to the Silver Cord, one of the mines of the company, that the matter has a singular look.

LATER.—The *Andalanche* contradicts the above report, and says the mill will soon start up, and that a new crew of men will be employed at the mine.

COLORADO.

From the *Journal* of Dec. 8th: The Consolidated Gregory and the Pioneer Smelting Company have been consolidated since the first of the month.... Mr. G. K. Sablin returned from the East recently, and talks of starting up the Union Company's works on the Bates. He has an 8-inch pump on the way out.

Mr. Bruce has taken out about \$50,000 during the past summer from his claim on the Foote & Simmons, and with the little old water stamp mill of the Holman Company. The premium on gold has paid his expenses, so that he has made, in currency, all that he has taken out in gold.

We were recently shown by William Canning a fine piece of argentiferous galena taken from the Ruby lode, Illinois Central district. The shaft from which this specimen was taken, is fifty-eight feet in depth, with a 30-inch crevice, four feet between walls.

Yesterday Mr. Bruce tried twenty pounds of Red Mountain ore. He found the yield equal to about \$160 per ton.

Mr. Meade informs us that the University Company has again got a good pay vein on the Gunnell, at a depth of 270 feet, having had sixty of what is called cap. Mr. M. has purchased the Gregory Extension engine and hoisting rig of the Black Hawk Company, which he is setting up on the Gunnell mine. Five or six cords of the company's Gunnell ore, crushed in Kimber Bros.' stamp mill in Eureka, yielded at the rate of \$300 per cord. Mr. Meade has fitted up the company's 15-stamp mill here in Black Hawk—old Rhodes' mill—and is going to start it Monday.

The Bobtail Drainage Company have had bad luck with their pump, have broken two large driving pinions, one after the other. These were brought from the East; but Langford & Co. yesterday cast for them a 3,000 pound wheel which will stand. The pump will soon be in operation.

MONTANA.

From the *Post* of December 8th: Eighty and a half tons of quartz from the Whitlatch Union yielded \$5,272.80. This was the result of 5½ days' run of Turley's ten-stamp mill. This was the first run, and it is estimated that at least \$800 was left in the batteries, which would give an average of \$71.90 per ton. This is the best clean-up yet made in the Territory. The ore was not selected.

Five new dry gulches have been discovered the past week between Indian and Beaver Creeks, seventeen miles from Helena. From ten to fifty cents to the pan have been washed out. The mines are shallow, and as soon as a ditch four miles long is completed to furnish those diggings with water, another rich gold producing section will be opened and add to the coffers of Montana.

The *Stockton Herald* says: An old citizen of San Joaquin county, just returned from Montana, gives a deplorable account of the condition of that country. Thousands of men

are endeavoring to get away from there. He says men can only work four months in the year; the rest of the year they are engaged in keeping themselves from freezing. Unlike California, the small gulches yield no gold; only in the large gulches can any gold be found.

From the *Rocky Mountain Gazette* of Nov. 24th: Prof. Steitz's second "run" is a huge cake of unadulterated silver, weighing 150 pounds avoirdupois. It was taken from 4,000 pounds of crude ore from the Legal Tender.... The accounts from the French Bar mines are highly encouraging. The gold is very pure and comes fully up to the standard of the Highland Gulch gold, which, it is said, is worth \$19 an ounce. French Bar is at least two miles long, and a mile in width, and consequently, will afford employment to a large number of men, when facilities are completed for working it to its full capacity.

A nugget of pure gold, worth \$160, was taken out of Highland Gulch a short time since.

OREGON.

From the *Oregonian* of December 14th: It is stated that Frank Cooper, of Salem, has discovered a vein of coal in the mountains about 20 miles from Portland.... Hitherto all the iron used in our foundries has been imported, but that sort of business will be soon played out. In the course of a few months the inexhaustible mines of Oswego will supply the Oregon demand, and, if we mistake not, turn the tide of freights the other way.

We have been shown some specimens of the Tillamook coal recently discovered. It is of the bituminous variety. Mr. Foley represents the discovery as situated within a very short distance of Tillamook bay, where it can be got out and put on board without hauling, at a comparatively trifling expense. The vein from which the specimens were taken shows indications of being a large one.

There are mines on the Columbia river, about ten miles below Umatilla, where a party have been at work during the past summer and fall making from \$6 to \$12 per day to the land.

A telegram from Jacksonville, Dec. 17th, says: The Red Beach diggings, near Randolph, have been found to be extensive. Some claims are paying one hundred dollars per day to the land.

Mining at Canyon City was going on with about the average summer's luck. The roads were excellent.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. SMITH, M. D., Consulting Physician; R. S. MACHEN, M. D., Attending Physician; W. G. W. HANFORD, Manager; H. ANDREWS, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings. 16v13-4f

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. n6v

To Owners of Mineral Cabinets.

A miner in Nevada has a lot of choice Crystals, which he desires to dispose of at reasonable rates to parties who may desire to complete their display of minerals. Address the office of the "Mining and Scientific Press." 19v13-tf

Mammoth Quartz Lode, Keysville District, Kern County.

"To all whom it may Concern."

ALL PARTIES negotiating for interests in the above Lode, would do well to examine titles before investing, as the legal title to a considerable portion thereof is vested in the undersigned.

WILLIAM MARSH,
W. L. KENNEDY.

Keysville, Kern County, Oct. 1, 1866. 16v13nr5m

ALLEN'S LUNG BALSAM!

For the Cure of Consumption and all Diseases of the Lungs.

THIS BALSAM is introduced to the suffering public after its merits for the positive cure of such diseases have been fully tested. The formula from which it is prepared is referred to by the leading medical journals as being equal to any prescription that can be made up, for such diseases, by the medical faculty. The BALSAM is, consequently, recommended by physicians who have become acquainted with its great success. As an expectorant it has no equal. DR. A. L. SCOVILLE, who has, for many years, been known to the public throughout the United States as the inventor of remedies for the lungs, recommends ALLEN'S LUNG BALSAM as surpassing anything that has ever been offered to the public for the cure of Lung Diseases. He has used in it his own family with great success in the case of his sister, who was supposed to be in the last stages of consumption. This lady is now well, and has been permanently cured by Allen's Lung Balsam. 22v13-1m

MELLVILLE C. KEITH, M. D.

Homeopathic Physician,

No. 635 Howard Street, between Second and Third, SAN FRANCISCO.
Devotes special attention to CANCER, PARALYSIS and CHRONIC DISEASES. Consultation free. 18v13-6mr

MOUNT DIABLO COAL.

CHEAP FUEL!

Cheaper than the East.

From the Independent Mine, at \$10 per ton.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. San Francisco, Jan 11th, 1866.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

San Francisco:

Saturday Morning, Dec. 29, 1866.

NOTICES TO CORRESPONDENTS.

"MOLINO."—SACRAMENTO GRAY STONES, for bruising wheat and oats, especially the latter, are usually formed of a silicious breccia, or conglomerate, which under the hammer dresses somewhat rougher than horn-stone. They are not so hard as the latter, but do very well for the coarse work alluded to. Such stones in Europe are usually obtained from the carboniferous series of beds known as "Millstone Grit," a term applied in consequence of their supplying that continent with the greater part of the coarse millstones consumed. These beds usually lie immediately underneath the workable coal in many parts of England; and generally, indeed, we might possibly with truth assert that such is invariably the case in Wales, from which circumstance it has been denominated "Farewell Rock" by the local miners; as practical tests have established the fact that in the Welch coal field it would be fruitless to search for coal below these millstone-grit beds. In other parts of the world, and even in England, workable coal has been found in them; and in some instances even in the sub-lying carboniferous limestone. For the purposes you require we have seen a very useful rock, a specimen of which we have in our cabinet, which, it is said, came from the Southern coast, though from what particular locality we could not learn. Perhaps some of our readers will favor us with an account of it. Its utility for the purpose under notice was known to the Spanish residents prior to the American occupation. The few specimens which have heretofore been brought to San Francisco, it is stated, have been obtained from boulders lying on the shore of the ocean. It is evidently of volcanic origin, and doubtless exists *in situ* in immense masses.

"N. P."—ZIRCONIUM.—Since the discovery of aluminium, which was brought about by the aid of the powerful reducer, sodium, chemists have been untrifling in their endeavors to obtain the other metals suspected to exist in the bases, which had until then resisted every effort to decompose them. It was thus magnesium was found soon after aluminium; and now M. Troost, in a paper addressed to the Academy of Sciences, has described his researches in zirconium, or the base of zirconia, which is extracted from the precious stone called hyacinth zircon, or "jargon," remarkable for its delicate tints, varying between white and red. M. Troost wished to determine whether zirconium, already found in an amorphous state by Berzelius, was a metal similar to magnesium or aluminium, or a metalloid not unlike carbon, boron, or silicon. His first experiments were directed towards obtaining zirconium in a crystallized state, and in this he succeeded by heating one part of double fluoride of zirconium and potassium with one part and a half of aluminium in a crucible made of the charcoal which accumulates in the gas retorts, and at a temperature equal to that required for melting iron. When the crucible has cooled, the surface of the button of aluminium which has been formed is covered with thin crystallized laminae, pressed together like the leaves of a book. The aluminium may be removed by dissolving it in hydrochloric acid diluted with twice its volume of water; by this means the laminae of zirconium may be removed, but there still remains some, consisting of an alloy of aluminium and zirconium. The pure metal, in the crystallized state, as described, is a very hard substance, of great brilliancy, resembling antimony in color, luster and brittleness. The laminae are easy to cleave in two directions inclined to each other at about 93°, their planes being inclined to the third or ground plane at an angle of about 103 deg. The density of crystallized zirconium is 4.15. Chlorine combines with it at a dull red heat; the sulphuric and nitric acids do not attack it at the ordinary temperature. Its real solvent is hydrofluoric acid. Amorphous zirconium, as obtained by Berzelius, is a powder scarcely distinguishable from powdered charcoal; it is a bad conductor of electricity.

THE EUREKA MINE—SULPHURET WORKS.

There is probably no mine on the Pacific coast which has been better managed, during the past two years, than the well known Eureka mine of Grass Valley, in this State. Neither is there any other mine on which so much practical and scientific talent has been brought to bear. The Messrs. Watt, under whose superintendence this mine has been placed, have had large experience, to which is added sound practical judgment, guided by which they have never been known to make a mistake in the management of a mine. As the result of their management in this particular instance, aided largely, it is true, by fortune in finding good ore, they have raised the Eureka from a second or third class mine to that of the first—if, indeed, it does not stand to-day the first, for its extent on the entire Pacific coast. The monthly yield of the mine, for the past year or so, has exceeded \$65,000; out of which monthly dividends have been made, ranging from \$30,000 to \$40,000.

From the very start of the new company, the Messrs. Watt have always concentrated and saved their sulphurets, which have been sold from time to time, as the most favorable opportunities presented. During this time the managers have been unceasing in their inquiries and investigations, as to the best mode of both saving and disposing of this important part of the product of the mine. With a knowledge of the care and judgment which has guided them in their determination upon a permanent plan of operation in this particular, it cannot fail to be of value to our readers to learn the decision to which they have arrived.

For Concentration, after trying several plans of California and other inventions, they have finally decided upon that of Rittinger's Funnel or Pointed Boxes, which, under various modifications, have been in use for many years in Europe, both on the continent and in England. The device is exceedingly simple, self-acting, and requires no power. We shall endeavor to give a full description of it next week; the space required for the same being more than we can spare in the present issue.

The Disposition of the Sulphurets, determined on, is that of working them upon the ground by the chlorination process. This department has been placed under the special charge of Mr. G. F. Deetken, a gentleman who has had large experience in this branch of metallurgy, and who is now engaged in putting up the necessary furnaces, fixtures, etc. Various modifications will be introduced into these works, such as have been suggested by the most careful inquiry, and an extended practical experience. Perhaps the most important of these modifications is the construction of the

Furnaces for Roasting the Sulphurets.—These furnaces will be two in number, all the sulphurets being made to pass through both furnaces. It is well known to persons acquainted with the desulphurization of ores, that it requires two or three times the amount of time and heat to throw off the last 20 per cent. of sulphur, that is required for removing the previous 80 per cent. Hence it must be quite apparent that much economy can be found in the employment of separate furnaces for the first and last portion of the operation.

Acting upon this idea, Mr. Deetken will employ, for his first operation, Parke's double, revolving reverberatory furnace. This furnace will consist of two revolving hearths, one above the other, so arranged that the flames, after passing over the lower hearth, will ascend and pass, in reverse, over the upper hearth, from whence they will escape through a chimney placed directly over the fire-grate. A hollow cast-iron shaft passes perpendicularly through both of these hearths, to which arms are attached, with stirrers, communicating with the contents of each hearth, and by which, as the hearths revolve, the sulphurets will be thoroughly stirred. The heat will cause a current of cool air to pass constantly through this shaft, which essentially aids in preserving it from the corroding action of the sulphur. The arms and stirrers can be readily replaced, as often as destroyed, and at a trifling cost.

Each of these hearths is capable of receiving

a charge of four tons of sulphurets, which, with the consumption of two cords of wood, will be relieved of 80 per cent. of its sulphur in about eight hours—one ton per hour—with no cost for stirring. The temperature required for this furnace is merely a dull red heat.

From hence the sulphurets are removed to an ordinary reverberatory hearth, where the charge is limited to one ton to each furnace, and where a very light heat must be maintained, approaching gradually to near the point of fusion. The remaining 20 per cent. of sulphur is here driven off, when the mass is ready for the chlorination treatment, which we shall hereafter describe.

In the process of the investigations which have led the Messrs. Watt to the adoption of the chlorination process, several experiments have been made to test the comparative value of pans for working sulphurets; both raw and roasted, the detail of which we must defer to another issue.

CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

116.—MR. T. F. DINGLEY sends us a specimen of quartz containing auriferous sulphurets, from the Providence mine, near Nevada City, with a memorandum of assay, showing \$119.26 gold and \$32.77 silver, to the ton. Working tests made in this city give \$48.20.

117 is a specimen from the same ledge, containing auriferous pyrites, with galena.

118.—MR. KUSTEL has laid upon our table a very fine specimen of nickel and cobalt ore, from the Peacock mine, near Cisco, Placer county. To the uneducated observer, the ore would be taken for a very good quality of yellow sulphurets of copper, a large amount of which is present with the nickel and cobalt.

119.—PROF. ROWLANDSON contributes a specimen of "Millstone Grit," a silicious breccia or conglomerate of volcanic origin. A mineral similar to this, is often found under the coal measures in Wales, Eng., where it is denominated by the miners, "Farewell Rock," from the circumstance that whenever this rock is encountered in the search for coal, the workmen always bid farewell to any further hope of finding that mineral. This is the same mineral referred to in our "Notices to Correspondents" under the head of "Molino."

STEAM FOR CHINA AND JAPAN.—One of the most important events in the history of this city is to be inaugurated on Tuesday next, in the sailing of the first steamer of the San Francisco and China Mail Steamship Line. The Pacific Mail Steamship Company have been quietly and unostentatiously making preparations for this event for some months, and on Tuesday next, the staunch steamship Colorado will leave this city on its first trip for China and Japan, to be followed thereafter by monthly steamers. The magnitude of the enterprise and its importance to the future prosperity of this city, can scarcely be estimated. Our citizens will duly notice the event by a grand banquet at the Occidental on Monday evening. Several prominent merchants and mercantile agents, from this city and New York, will go out on this trip to establish or re-inaugurate business arrangements in China and Japan, such as may be required for this new phase of our Oriental mercantile intercourse. The establishment of this new and rapid means of communication with the Orient, and the completion of the Pacific Railroad, will eventually establish San Francisco as the commercial center of the Western World. The trade and commerce which it will at once attract to this city, will be important. Already, with nothing but sailing vessels in the Pacific, and our round-about Isthmus transit, three-fourths of all the tea trade with Japan, pass through San Francisco. That of China will now be added, with its silks and other wares. The millions of Eastern Asia, that great central hive of humanity, are now to be brought into steam communication with Europe and America. The effect cannot be doubted. Steam will do for China what it has done for every other people everywhere it has been introduced. It is the great civilizer of the world. It will soon build up a commerce, the wants of which even a weekly line will be totally inadequate to satisfy. The inauguration of such an enterprise may well be made a matter of gratulation and of joy.

[Written for the Mining and Scientific Press.]

Reply to Professor Wurtz.

EDITORS PRESS:—So much has been already written about sodium amalgam, that it requires some assurance to present the same subject again to your readers; but Professor Wurtz's letter, which appeared in your issue of December 15th, compels me to ask of you some space, and I will try to be as short as possible.

If I am not mistaken, Mr. Wurtz takes pains to impress the idea that his invention of the application of sodium quicksilver refers exclusively to metallic substances. He says " * * * that the use of sodium amalgam is beneficial in gold amalgamation (which can only be understood as a concession of all I claim—namely, that sodium exalts the adhesion between quicksilver and the precious metals. * * *) And again: "The above experiment will serve to exemplify the mode in which the exalted adhesion and more intimate contact produced by the eodium enances and quickens voltaic and chemical reactions between metallic substances."

This property of sodium amalgam I never disputed; but many persons, who had their own reason for it, tried to make people believe that the sodium is also a most beneficial agent on silver sulphurets. Although the decomposing action of sodium on most of the silver ores is remarkably vigorous, different considerations, which I do not think it necessary to reiterate, disavow the use of it on silver ores. Mr. Wurtz admits this himself by writing: "I fear it may be necessary for me to add here, distinctly, that these calculations are intended only as illustrative; else I might be accused of justifying the direct use of sodium as a reducing agent in silver metallurgy, the time for which has not come yet."

Mr. Wurtz, however, seems to believe that a very small quantity of sodium is beneficial on silver ores by its "voltaic action." This benefit is what I deny, and that denial is based upon experiments. When I made the experiment with an "excess of sodium on rich silver ore," it was not through want of knowledge of the small quantity of sodium which should be used, but because I found that a small quantity was of no avail, that I tried an excess to determine its behavior. The quicksilver of the said experiment was not "loaded" with base metals; its amalgamating power was not destroyed while sodium was present; but the adhering sulphurets, combined with the apathetic condition which the quicksilver assumes after the sodium has been used up, prevented the amalgamation.

Mr. Wurtz recommends to me and other practical metallurgists, to bray in a mortar precipitated chloride of silver, iron filings, and eodium quicksilver. To show even a much more striking result, there is no necessity of resorting to a silver combination which is not found in nature in the same aggregate condition. If sulphurets of silver (silver glance), cut in small fragments, be brought into contact with sodium quicksilver, all of it will disappear instantly; there is no need of iron filings. The natural chloride of silver, with or without filings, does not exhibit a like behavior, but a great part of it is taken up by the quicksilver.

There is in these phenomena with silver glance and the natural chloride of silver, no contradiction in relation to the required equivalent quantity of sodium; for a close observation will show that the particles are only "transiently enfilmed"—exactly like the iron—and if such amalgam be retorted and melted, sulphide of silver would result.

There is also no contradiction in my saying that eodium amalgam has a beneficial influence on gold quartz; that sodium quicksilver may collect silver amalgam particles out of a slimy matter, and that the use of sodium amalgam causes a greater loss in quicksilver. All depends on the circumstances under which the operation has been performed, which I never omitted to mention when I wrote about greater loss of quicksilver.

Mr. Wurtz says in his letter, that I "still adhere to, still strongly insist on," preconceived ideas; but I vainly look for a reasonable refutation of what I said. The "*reductio ad absurdum*"—whatever it really means—shows nothing. Firstly, it would be necessary to show where in the world the chloride of silver, by itself, is treated by metallurgists, or rather, where can it be found pure with gangue in sufficient quantities for treatment? Secondly, there is no necessity to have the expense of sodium approach the sum of \$97.75 per pound, to make it more expensive than other treatments. Thirdly, there would be used up four or five times more sodium than is required for the decomposition of the chloride of silver contained in the ore (for reasons which I have already given). Besides this, the value of the bullion will be depreciated by base metals.

G. KUSTEL.

NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions, also the List of Patent Claims recently issued from the U. S. Patent Office to Inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

MEASURING FAUCET.—Seba Squire Wiles, Santa Clara, Cal.: 1 claim, 1st. This faucet composed of the barrel, A, and the feed and discharge passages, C and D, with the valve, d, operated substantially as described. 2d. In combination with the devices above claimed, 1 claim the scale, O, index, b, and piston, B, with its rod, c, all arranged to operate substantially as and for the purpose set forth.

AN IMPROVED BRICK KILN has been introduced in England, designed to economize the heat employed in burning brick. By this arrangement, first, the gaseous products of the fuel are all saved for consumption; second, the heat passing off from a burning kiln is made to pass through another kiln, just set up, thus drying the new fresh bricks, and raising them gradually to a high heat, before any fuel is placed in this kiln to complete the burning; thirdly, the heat from the cooling of the first kiln, after being burnt is economized, by causing it to pass into a kiln just lighted, to supply the fire with air for combustion. Thus it will be perceived that every particle of the fuel is perfectly economized, and even the radiating heat is pretty effectually employed, by being made to aid in the various stages of the work. All this is accomplished by constructing the kiln in such a manner as to constitute a circular tunnel, divided into twelve or more compartments, with a doorway to each.

A BOSTON ARTIST has the patent right for the United States of a new invention for outdoor photographing. The camera is called "pantoscopic." The lens, by means of mechanism, is made to move steadily around the circle, so as to take a panoramic picture instead of a view of a single point. The plate slides along at a corresponding rate.

RECENT INVENTIONS.

A NEW PROCESS FOR MAKING GAS from wood and other substances, has been devised by Mr. Ensley, a Canadian, by which it is claimed that 4,500 feet of gas can be obtained from half a cord of wood and a barrel of bones. But this is not the only saving. When these articles are consumed, according to Mr. Ensley's directions, there is little or no waste of values; but simply a transmutation into other commodities of nearly equal value, to which the gas is superadded. The wood yields not only gas, but charcoal, tar and turpentine. The bones give a residuum of ivory-black, phosphorus and ammonia; and the vegetable substances, residuums of other things. In this manner the gas becomes, as it were, a mere incidental feature, manufactured only at a minimum expense, but of an excellent kind.

SELF-FASTENING BUTTONS.—Numerous attempts have been made at various times to introduce a method of securing buttons on clothing which should supersede the process of sewing. Hitherto the object has not been effected, owing to the several drawbacks which have arisen to bar the practical application of a mechanical fastening. Now, however, the difficulty appears to have been overcome by a most simple contrivance. This invention, which has just been patented, consists in constructing buttons with shafts formed of a strip of metal or wire, upon the principle of the well-known paper fastener, and provided with a washer made with an aperture just large enough to allow of the two plates of the shank when in contact passing through it. The plates or wires are of such metal as allows of their being bent without breaking.

AN IMPROVED PLOW.—Messrs. Baxter & Blake are having cast at the Globo Foundry, of Stockton, an improvement on the Boston Clipper plow, concerning which the Independent of that city says: "The main standard is somewhat higher than the original Clipper, and is likewise broader at the top. Mr. Baxter claims the improvement in the 'standard,' while Mr. Blake is entitled to the credit of making valuable improvements in the mold-boards, shares and landsides. The points and mold-boards are cast from a metal known as 'white amalgam,' which is as hard as glass, and, at the same time, is difficult to break. Mr. Yolland, Mr. Castle, and other farmers, have tested the plows, and find them to be all that is claimed by the inventors. In either sandy or adobe land they work to a charm, and from the peculiar hardness of the metal composing the mold-boards and points, they possess the merit of outwearing any other plow in use."

PATENTS can be obtained for citizens on this Coast through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. In one half the time it takes to operate through Eastern agents. From our familiarity with the subject of most California inventions, and the benefit arising from personal explanations, we are prepared to present claims with greater accuracy than could reasonably be expected of distant agents. Advice and Circulars FREE.

DEWEY & CO.,

Patent Agents, 505 Clay street, San Francisco.

HENDY'S CONCENTRATOR.

Hendy's Improved Patent Self-Discharging Sulphurets PRATER CONCENTRATOR Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

LOUISIANA MILL, Bear Valley, Mariposa County. SPRING HILL MILL, Amador, Amador County.
LOUISIANA MILL, near Coulterville, Mariposa County. GOLDEN GATE MILL, Volcano, Amador County.
OPHIR MILL, near Newcastle, Placer County. RAWHIDE MILL, Jamestown, Tuolumne County.
C. H. SCHNABEL'S MILL, Doty Flat, Placer County. TRIUNFO G. & S. M. CO., Lower California, Mexico.
JERSEY BLUE, near Folsom, Cal.

And in use in many other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

Hendy's Latest Improved Concentrator.

By this improvement the conical feeding distributor has been entirely done away with. The feed in this machine is made to enter the conical hopper; from thence it passes through the hollow arm, leading to the T attachment, marked B, which is made to sweep slowly around the circumference of the pan, by means of the ratchet teeth upon the upper edge of the same, into which two pawls are seen to work. This motion is obtained from the vibrating action of the pan, as in common use. Upon the under side of the T attachment to the arm, are small openings or perforations, through which the pulp is dropped from the feeder into the pan. The constant revolution of this arm secures a more uniform feed than can be obtained from the conical feeder. A set of stirrers, with small projectors or teeth is shown, which is also kept in revolution with the feeding arm, the design of which is to prevent the sand from packing near the center, where the motion is diminishing. The discharge orifice and box for receiving the sulphurets will be readily distinguished at box C. These pans may be so connected, as in the end, that two can be driven by one shaft and pulleys. These machines have been thoroughly tested, and pronounced a perfect success.

Certificates:

JOSHUA HENDY, Esq.—Dear Sir: I have been using three of your Improved Concentrators for the past four months, at the Spring Hill Mill, and they give perfect satisfaction.
Yours truly,
WM. H. HOOPER,
Two of these Improved Machines have been ordered by Mr. Hooper, for the Gold Hill Mill, at Grass Valley.

JAMESTOWN, TUOLUMNE COUNTY, CAL., July 18th, 1866.
JOSHUA HENDY, Esq., San Francisco:—MY DEAR SIR: It gives me pleasure to inform you that the four "Improved Self-Discharging Prater Concentrators," which I purchased from you, have now been in operation in the Rawhide Mining Company's Mill for more than two months, and have more than realized my expectations.

I am free to say it is the best Machine for saving Quicksilver, Amalgam, and Sulphurets that I have ever used or seen used for that purpose. I shall take pleasure in showing any one interested the Machine in operation, who will call at the mill. I shall need four more as soon as the balance of my mill is completed. Yours truly,
R. P. JOHNSON, Superintendent Rawhide Mill Company.

A Circular giving further particulars will be mailed to any part of the United States free of expense. Address,
JOSHUA HENDY,

402 Montgomery street, San Francisco, Room 3, Fourth Floor.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Tug, Rags, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flat, Tubular, Upright, Cylindrical and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Feldin's pan, Yeatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Ocaring, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

6v12-ly

A NEW explosive mixture called "Poudre Fontaine," used in the torpedoes which were tried against the hull of the Vauban, has been employed in blowing up the old quays of one of the basins at Toulon, now in process of extension. A mine charged with five kilogrammes of powder exploded with such effect that a charge of one hundred kilogrammes in the ordinary gunpowder would have caused less destruction. The charge was purposely a small one, and the engineers congratulated themselves on having commenced so cautiously. A singular result of the explosion was the killing a quantity of fish. The workmen picked up seventy or eighty pounds weight, which floated on the surface of the water. The same phenomenon had been remarked from the action of the torpedoes.

SAMPLES of thirty-four varieties of Batavia rice seed, ten of which are for dry fields, have been received by Mr. J. Q. A. Warren, who will send samples to cultivators without charge.

RATS often do much damage by gnawing leather belting. This can be prevented by rubbing the belting with castor oil.

Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of red boulders. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, Mining and Scientific Press. 14v13-1m

CONNECTICUT

Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS.....\$12,000,000.

THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,
The Largest Amount Insured,
The Largest Surplus,
The Largest Business,
The Largest Income,

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT. of the premiums paid during the year ending 31st of January, 1887.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies to which Life Insurance is applicable, among which forms are—

Whole Life Policies, by a continued annual Life premium.

Whole Life Policies, by TEN annual premiums.

Endowment Policies, by a continued annual premium.

Endowment Policies, by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give a note in part payment of the premium, but may, if preferred, pay the first four premiums in cash, after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums one-half. When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be applied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

DIRECTORS:

Accidental Insurance!

The Accidental Insurance Company OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident. In case death does not result from the injury, the insured receives a weekly compensation as long as he is disabled (not to exceed twenty-six weeks).

ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in tenths of the Annual rate, as follows:

1 month, 2-10.	4 months, 5-10.
2 " 3-10.	5 " 6-10.
3 " 4-10.	6 " 7-10.

GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices through the country.

They make Insurance for \$5.00, and \$25 per week compensation, against Accidents of every description, traveling or otherwise, good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident" to the Public conveyance in which the assured may at the time be traveling, but they are GENERAL ACCIDENT TICKETS.

SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and other Ports. Rates varying with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with Wm. Barnes, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

INDUCEMENTS.

The rates of Premium are very low. The Plan is so simple that any one can comprehend all its workings.

No MEDICAL EXAMINATION IS REQUIRED, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory use can be made of so small a sum.

For Policies or further information, apply to

Commencement of Fourteenth Volume

Mining and Scientific Press

Published Every Saturday.

The title of our journal is a truthful expression of its character.

It affords a class of progressive information to the Miners, Mechanics and Professional Men of the Pacific Coast, which cannot be derived from books, or other publications.

Each Volume comprises, in reality, a book of new intelligence and facts relating to Mining, Mechanism, Metallurgy, Science and Art, developed by our rich and peculiar resources, and identical with our own industry and history.

By the encouragement of intelligent economy in LABOR and GOLD-SAVING, we shall make the PRESS a source of INDIVIDUAL PROFIT to its patrons, as well as a public benefit to every local community in which it circulates.

The prospects of our journal are now brighter than at any former period. Our facilities for furnishing a valuable paper are constantly increasing.

Editorial Expressions:

Following are some of the many opinions generously expressed by our neighbors:

MINING AND SCIENTIFIC PRESS.—The paper whose name we have just written, ranks among the leading scientific journals of the world. On mining matters it certainly has no equal, and more than all other causes combined, it has advanced the interests of the quartz miners of the Pacific Coast. Its editors are men of thorough education and large practical experience, and its list of contributors embraces many names distinguished in the various fields of scientific exploration and mechanical invention. The MINING AND SCIENTIFIC PRESS ought to circulate universally among intelligent Californians, to whom we most cordially commend it, and its traveling agent, O. P. Truesdell, who is now canvassing this city and county, and will shortly visit other counties in the southern part of the State, in its interest. —[Stockton Daily Independent, Sept., 1866.]

"SULPHURETS," and "Our Lady Correspondent," of the MINING PRESS, have each contributed an interesting article on Mines and Mining in Amador county. Hope they will keep up the fire. One of our subscribers complains that "Sulphurets" fell into an error, in stating that the sulphurets of the middle or Jackson range are richer than those on the upper or Pine Grove. He thinks it is just the reverse. —[Amador Ledger.]

SUBSCRIBERS FOR IT.—The large, illustrated sixty-four column weekly newspaper—the San Francisco MINING AND SCIENTIFIC PRESS—should be taken by every miner, prospector, and intelligent citizen throughout Colorado, as it gives a mine of most useful information to be gained no other way, on mining matters generally. —[Rocky Mountain News.]

The publishers intend to make it the "Scientific American" of the Pacific Coast. Every miner should have a copy of it in his cabin, for it will be filled with useful information so the pick and shovel fraternity. —[Trinity Journal.]

MINING AND SCIENTIFIC PRESS.—We received a visit a few days since, from Mr. Wood, agent for the MINING AND SCIENTIFIC PRESS, who is now canvassing this county for subscribers to that valuable journal. The Press is invaluable to miners and mechanics, being the only journal of any importance on the coast entirely devoted to their interests. —[Mountain Messenger.]

The public should support the enterprise of the MINING PRESS, one of the best papers in the State, by a liberal patronage, as it is only by a system of legitimate reports that our mines can be favorably brought before men of capital below. —[Calaveras Chronicle.]

Its correspondents are men of science and learning, and hail from all parts of the coast. It is published at San Francisco, at \$5 per annum, or \$3 for six months. Address Dewey & Co., publishers of MINING PRESS, San Francisco. [Nye County News.]

It embraces one of the finest fields in the world, and seems to improve it. * * * It will be second to no scientific record now published on this continent. —[Los Angeles News.]

Prof. J. D. Whitcomb's address on Mining, is given entire. * * * We preserve the Press, and would like to have a full file. —[Napa Reporter.]

A neat and useful journal. One of the most presentable and useful in the State. —[Sunday Mercury.]

Friends pleased with our efforts in the publication of the Press can render us essential aid by furnishing correspondence and all important information which may come under their observation, and by calling the attention of their neighbors to the commendable features of the paper; the appreciation of which favors will be duly manifested by the constant improvement of our journal.

Specimen copies will be sent free to those desiring to examine the paper before subscribing. Postmasters, Express Agents and News-dealers, acting as our agents, will receive liberal commissions.

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

W. E. MAYHEW, Druggist,
N. W. Corner Fourth and Howard streets San Francisco.

He gives his personal attention to the preparation of Physicians' prescriptions.

Also, has constantly on hand a choice assortment of French, English and American Toilet Articles 16v13-6w

ENGRAVED TO ORDER.—Persons who desire to illustrate their individual establishments or businesses, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

DEWEY & CO.,
Patent Agents, Publishers and Job Printers, 505 Clay st

OWING to its general circulation, the MINING AND SCIENTIFIC PRESS has perhaps been as valuable and useful to the mining interests as that noted paper, the London "Lancet," was to the medical profession, acting either as a scarifier when too great a plethora of mining bubbles prevailed, or as a styptic where dangerous bleeding of the pockets of the capitalists was concurred. —[Copperopolis Courier, Oct. 13]

JOB PRINTING

—FOR—

THE PEOPLE!

Mining and Scientific Press

JOB PRINTING OFFICE,

505 Clay Street,

(Southwest corner of Sansome street, on 2d floor.)

Formerly WATERS BROS. & CO.'S.

We are now prepared to offer customers the most favorable inducements to patronize our Book and Job Printing Establishment. Our office is supplied with an extensive assortment of Type, and the best style of Presses for book work and

CHEAP AND RAPID PRINTING.

Patrons will always find us well up to the times, ready to execute superior work, and furnish the same as cheap as any prompt and reliable firm in San Francisco.

Our aim is to suit our customers in regard to style and prices, and will guarantee entire satisfaction to every reasonable individual who may be kind enough to bestow upon us his patronage.

We give especial attention, when desired, in assisting parties in making up or revising their copy. Particular care will always be given to the publication of

LAW BRIEFS,
CERTIFICATES OF STOCK,
MISCELLANEOUS BLANKS,
BLANK BOOKS,
MINING BLANKS

BOOKS
PAMPHLETS,
CARDS,
CIRCULARS,
MINING REPORTS.

Orders from the Interior will receive prompt attention. We shall take care to secure correctness in all work executed for parties out of town. Small packages can be forwarded by mail at small expense.

City customers, or persons visiting an Francisco, are invited to call and examine our specimens, when they will be politely informed of our prices by the Proprietors.

THE CIRCULATION of the PRESS, already extensive, is rapidly increasing, and substantial tradesmen who can profit by widely disseminating information of their business amongst the most intelligent, individual and industrial classes of the Pacific States and Territories will find no more effective or economical medium for advertising.
DEWEY & CO., Proprietors,
Patent Agency and Job Printing Office, 505 Clay street, San Francisco. (Jan.) July 1, 1866.

Preparing for Publication.

A complete History and Directory of the

Central Mines of Colorado.

And the towns and cities in their vicinity.

PERCEIVING THE GREAT ADVANTAGE TO COLORADO a pamphlet, historical and descriptive of its central and most important mines would be at the present time, the subscriber has undertaken to publish such a work.

It is designed to fix for the future the discovery and early history of the mines, to sketch their progress and present condition, to give such statistics as are attainable with regard to their production, actual and possible; in fine, to disseminate throughout the East and in Europe accurate information respecting them. To relieve the tedium of such a work, interesting incidents illustrating the early manners and customs of the pioneers, and the gradual organizing into its present existence of the first, and always to be the eminently Rocky Mountain State, will be given.

It is also designed to contain a complete Directory of the towns of Central, Black Hawk, Nevada, Golden City, Idaho, Empire, Georgetown, Cold Dirt, and South Boulder; views of each of those places; separate views of the principal buildings, public and private; also views of mills and mines and of mountain scenery.

There will also be attached a Business Department, in which a limited number of advertisements will be inserted.

O. J. Hollister, of the Black Hawk Mining Journal, has been engaged to compile the body of the work—the historical and descriptive narrative. Having been here uninterruptedly for the past six years, and mingled freely in perhaps every walk of life, he trusts he will be able to do the subject ample justice.

All old residents of this region who are familiar with the discovery and early history of the mines, or with interesting incidents of that indefinite time known as the "early day," will confer a favor on the subscriber by furnishing such information to O. J. Hollister, Journal office, Black Hawk, Colorado.

The work will be issued sometime during the month of August. Price \$2, bound in paper; in muslin, \$2.50.

Address C. M. BUCKLEY,
May 10th, 1866. Central City, C. T.

HALL'S SARSAPARILLA,

YELLOW DOCK AND IODIDE OF POTASS.

THE BEST BLOOD PURIFIER KNOWN.

Persons that are troubled with Rheumatism, Scrofula, Neuralgia, Morbid Liver, Salt Rheum, Pimples, Bolls, or any of the many diseases that originate from Impure Blood, would find it much to their advantage to give this justly celebrated article a trial. One or two bottles are quite sufficient to convince the most skeptical of its merits. It contains neither Spirit, Arsenic or Mercury, which cannot be truly said of any other preparation called "Sarsaparilla."

SHEPARDSON & GATES, Prop's.

N. W. cor. Sansome and Commercial sts. 22v13-3m

THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Fram; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and e, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

4v12

HUNTER'S IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares; receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphurets ore will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

ANDREW HUNTER, Inventor,
22v133m San Francisco.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery by the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,
1v1 San Francisco.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper annual for the concentration of mining patronage.

The Press is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.]

A. S. Hallidie & Co.,

MANUFACTURERS OF

FLAT & ROUND WIRE ROPE,

For Mining, Shipping, Ferry,
AND GENERAL PURPOSES.

Office—412 Clay street, Works—North Beach.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to any of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$ to $\frac{3}{4}$ inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Sizes and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

STANDARD SOAP COMPANY'S WASHING POWDER,

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for use in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lb bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 15v12q

ELECTROTYPING CUTS, ENGRAVINGS, Etc.—Our Job Printing office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

MINERAL RESOURCES OF COLORADO.—We extract the following from an address before the Board of Trade at Chicago by Gov. Evans of Colorado, in which was urged the importance of early railroad connection between Chicago and Denver City:

Lying along the great Cordilleras or snowy range, which divide the waters of the Atlantic from those of the Pacific ocean, directly west of Denver City, extending from near the base of Long's Peak in a southerly direction for over 200 miles in Colorado, is what I believe to be the most extensive and richest mineral belt of country in the world. A tract from five to fifteen miles wide, of this vast extent of the mountains "literally gridironed over with gold, silver, copper and lead-bearing lodes, many of them known to be of great extent and unsurpassed richness. While many of them, of course, are too narrow or too poor to pay for working, I believe that enough that are extensive and rich have already been discovered to give profitable employment to a million of men. And the extensive discoveries that have been made the past year assure us of a vast increase in their number in the future.

The pyrites from which the gold has been extracted, in a large proportion of the mines that have been worked, is found to be a very valuable quality of copper ore. The largest smelting works of Colorado are now making copper mat containing the bullion, which is shipped to New York and to Swansea, England, to be assayed. This product will furnish an immense carrying trade for the railroad; and from my knowledge of the vast number and richness of these copper mines (which are the richest in gold also), I have no doubt that Colorado, in addition to her gold and silver and lead, will soon produce more copper than any other of our mining districts, that of Lake Superior not excepted. I have just returned from visiting a district about one hundred miles by ten or fifteen in extent lying across the main mountain range west of Denver City, that is pervaded throughout by extensive and rich veins of silver; some are of pure silver ores, but the majority of them are argentiferous galena ores varying in richness; many of them yielding in the smelting furnace as high as six hundred dollars of silver to the ton of ore. Many of the lodes are very wide, and can be traced on the surface for long distances. The water-powers are abundant, and timber plenty through most of the mining districts, and the facilities for mining are extraordinarily good.

In addition to this, at the eastern base of the mountains opposite this mineral for over one hundred and fifty miles from the Arkansas to the Cache la Poudre, bituminous coal of very fine quality, and in veins from five to fifteen feet thick, is found at almost all points. The country thus filled with coal is known to extend eastward on the plains for from fifty to one hundred miles. At various points in this coal region are immense beds of the finest quality of iron ore, and one iron smelting furnace has been successfully put in operation already.

Extensive salt works are in operation in the South Park, supplying the home demand for the article, and capable of a production equal to any probable increase in the future demand. Several extensive oil regions have also been discovered near the base of the mountains. One well, 75 feet deep, yielding about 20 barrels per day, is in successful operation, while others, with greater promise, are being sunk at this time.

ANOTHER GOLD AND SILVER REGION.—The Nebraska Republican has the following:

Major W. R. English has just arrived in our city from Fort Laramie, who brings with him intelligence that there has been discovered about fifteen miles west of Laramie, gold and silver indications exceeding in richness any ever before discovered in this country. Major English brought with him specimens of the croppings of this new discovery, which are in the hands of General Myers and Colonel Patrick. They exceed in richness the first croppings of the celebrated Constock mine of Nevada. It is also stated by Professor North, the geologist, that there are immense deposits of coal in the same region of country. Professor N. has just returned to Laramie from this city to make more thorough examinations of the country thereabouts. The coal discoveries are stated to be of the most decisive character and extend over a large tract of country. All that is needed is for the Government to put down the Indians who are molesting that vicinity this season, to render certain, it is confidently believed, the development of the richest mineral district ever discovered in the United States. Government must give the protection required to develop these new fields of wealth.

A LINE of steam carriages for common roads is to be established between Marseilles, and a small town ten miles distant. The success of the similar line between Nantes and Paris is fully established.

CHIHUAHUA MINES.—"Las Huertas," a mine in Pinal, is said to be in a flourishing condition. The entrance to this mine is in a cleft of the mountain. It is now in the hands of a French house, who work it under the protection of soldiers. The ore is taken from the mine by Indians, who then break it up into pieces about the size of a walnut. The fragments, mixed with litharge, are thrown into furnaces, where they are melted. After several hours it is allowed to run off. The result is called "queta," and is a cake of silver and lead, for the metal is not yet pure. Another mixture of this is made, called "plachin," which is thrown into a second furnace. After six hours melting, the puro "plata" or silver runs out free from all extraneous matter.

The stock men and the agriculturists of Tulare Valley, are discussing the project of an artesian well. In 1858 the thing was tried in Visalia, but abandoned at a depth of two hundred feet. It is probable that a few feet further would have carried them through the clay stratum, and that water would have been obtained.

The Mercantile Library Association of New York have inaugurated a new and very convenient system. They have placed boxes in different parts of the city, in which members may place orders for books they desire. These orders are collected twice a day, and the books sent to the place indicated.

EXPERIMENTS have shown that the London Pneumatic Company can send one hundred and twenty tons of goods through their eighteen miles of tubes every hour, at a cost of less than one penny per mile.

WOODWARD'S GARDENS!
MUSEUM,
Art Galleries, Conservatories and Zoological Grounds,
On Mission and Valencia streets, between Thirteenth and Fourteenth streets.

Open Every Day!
ADMISSION:
To all parts of the Gardens.....25 Cents.
Children, under 12 years of age.....Half Price.

NEW ATTRACTIONS are being constantly added to all departments.
These Gardens are accessible by the Howard, Folsom and Market street Cars.
Schools and Charitable Institutions, accompanied by guardians, free on Mondays and Fridays. 23v13gr

Pacific Mail Steamship Co's
THROUGH LINE TO NEW YORK,
Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.
On the 10th, 19th and 30th of each month that has 31 days.
When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding, when the 18th falls on Sunday, they will leave on Monday following.
Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.
Departures of 18th or 19th connect with French Transatlantic Co's steamer for St. Nazaire, and English steamer for South America.
Departures of 10th connect with English steamer for Southampton, and P. R. Co's steamer for Central America.
Departure of the 30th connects with English steamer for Havre, the port of the new mines.

The following Steamships will be dispatched on dates as given below:
December 29th—GOLDEN AGE.....Capt. W. F. Lapidge.
Connecting with OCEAN QUEEN, Capt. Gray.
Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.
An experienced Surgeon on board. Medicine and attendance free.
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.
Through Tickets for Liverpool by the Inman Line, can be obtained at office P. M. S. Co., San Francisco.
For Merchandise and Freight apply to Messrs. WELLS, FARGO & CO.

The splendid steamship COLORADO will be dispatched for CHINA on TUESDAY, January 1, 1867.
For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.
OLIVER ELDRIDGE, Agent.

Rheumatism!!
Still Another Witness!

LATHROP, Cal., Sept. 19, 1866.
(White Oak Township, El Dorado Co.)
This is to certify that I have, for over thirty-six years, been afflicted with Chronic and Inflammatory Rheumatism, and the sufferings and tortures I endured in consequence cannot be told. I have, at an expense of thousands of dollars, employed many physicians, both in this country and in Europe (where I was born and resided many years), among which were several eminent professors of medicine, and I experienced no benefit from their treatment, more than at times a slight and temporary relief.
About two years ago I was induced by some persons who had been cured by it to use Richard's Remedy for Rheumatism. It is enough to say that I was almost immediately relieved, and that I have not suffered with it since. I keep the medicine on hand, and, on the first approach of any returning symptoms, I take a few doses, which invariably puts it to flight. I therefore cordially recommend it to all afflicted as an unfailing remedy for Rheumatism.

FRED'K FABER.

Knox's Improved Patent Amalgamator and Separator,

With Palmer's Patent Steam Chamber or Die.

For further particulars, inquire of
ISRAEL W. KNOX, on
W. A. PALMER, Inventors,
At the Golden State Iron Works, No. 19 First street, San Francisco.

Machinery.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:
No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2.—Or 15-inch Crusher, capable of reducing from three to five tons per hour.....\$850
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.
The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, A, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.
The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Vulcan Foundry, First street, San Francisco.
The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:—
"Rawhide Ranch, August 10, Sept. 28, 1866.
JAMES BRODIE, Esq., San Francisco—My Dear Sir: I give you pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use at the Rawhide Ranch Mining Company's Mine, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
Supt. Rawhide Ranch Quartz Mill."

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.
Those utilizing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$500 per Barrel.
A diagram, with explanation of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-ELAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.
A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.
PROBIE & RABELEE,
Express Building, 402 Montgomery street, San Francisco. 12v13lf

Notice to Miners,

Well-Borers and Water Companies.

M. PRAG is now prepared to manufacture Horizontal and Vertical Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.
M. PRAG,
8v13-ly Stove Store, No. 125 Clay street, below Davis.

Such a journal has been needed on the Pacific Coast. The Press fills the bill.—[Reese River Revivell.

STRONG & CO'S

CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator; has double Mullers, Trolling Shoes and reverse action. Millmen and others are respectfully invited to examine this Pan, before purchasing of any other, as it gives the best satisfaction. Can be seen in operation, daily, at the San Francisco Foundry, Fremont street, near Mission.

Ores, in lots not exceeding 2,000 pounds, tested by
22v13 G. W. STRONG, Assayer.

NITRO GLYCERINE.

Nobel's Patent Blasting Oil!

WE ARE NOW PREPARED TO SELL NOBEL'S PATENT Nitro Glycerine. The same is stored with Mr. O. S. SWENSON, at Michigan Bluff, Placer county, from where the Oil has to be received by purchasers. Application to be made to Mr. C. S. Swenson, or to the undersigned.

IGNITERS AND CARTRIDGES!

For sale at the same place. 23v

Mr. Swenson is willing, if desired, to show purchasers the mode of blasting, either at his own mine, Michigan Bluff, or at the places of purchasers. Pamphlets, with minute instructions, will be presented to every purchaser or applicant.
BANDMANN, NIELSON & CO.,
21v13 210 Front street, San Francisco.

FOR SALE!

QUARTZ AND MINING MACHINERY

ONE GARDNER'S THUNDERBOLT CRUSHER, Largest size and best quality; is entirely new, with all extras—has a large lot of other Quartz Machinery, including Engines, Boilers, etc.
16v13 **COFFEY & RISDO**

Ready for the Steamer "Colorado,"

On the 1st of January, 1867.

TO BE PUBLISHED ON THE DEPARTURE AND ARRIVAL of the Pacific Mail Company's steamer to and from China.

THE CALIFORNIA CHINA MAIL

—AND—

FLYING DRAGON NEWSPAPER.

Printed both in the English and Chinese languages, for China, Japan, Australia, Borneo, Siam, Malacca, Singapore, Hindostan, etc., etc.
One of the immediate and most striking results of this mutual intercourse, will manifest itself in the fact that this country will be

EIGHT DAYS

Ahead of Europe in its commercial intercourse with the countries of the East; and ultimately this line of communication must be the preferred road of the silk trade, etc., instead of the Suez route.

The price of the "California China Mail" will be

Twenty-five Cents per number—Annual Subscription, including Supplements, \$10 per Annum.

Advertisements, business notices, etc., in English only, will be charged fifteen cents a line; in CHINESE and ENGLISH, twenty-five cents per line; and one dollar extra for the translation of the first fifty characters; and one cent per character all exceeding fifty.
Copies of THE CHINA MAIL AND FLYING DRAGON may be had at all the offices of the Pacific Mail Steamship Company, in China and Japan.
Office, 328 Clay street, San Francisco. 18v13lf
